Olof Rudbeck's *Atlantica* (1679–1702) is a characteristically wide-ranging example of Early Modern scholarship in which the author draws on a compendious assortment of evidence to argue that his native Sweden was the cradle of human civilization. Within this discussion, he devotes particular attention to the Phoenicians, whom he attempts to paint as descendants of "Scythians" who had migrated to the Mediterranean from an original Swedish homeland. Drawing upon the work of earlier Phoenician scholars such as Joseph Scaliger and Samuel Bochart, as well as his own, often rather creative, etymologies, he seeks to demonstrate a relationship between the Phoenician language and Swedish. This paper explores how Rudbeck engages with and utilizes the Phoenician people and the Phoenician language in service of his wider proto-nationalist goals and places his work within the wider context of Phoenician studies in Early Modern Europe, a few decades before Barthélemy's decipherment of the Phoenician script (1758). While clearly wrong in many of his conclusions, Rudbeck's work can tell us much about perceptions of Phoenicians at an important time of transition between Renaissance scholarship and the beginnings of modern archaeological and linguistic research.

The *Atlantica*, Proto-Nationalist History, and the Emergence of Phoenician Studies

Born in 1630, the son of a bishop, Olof Rudbeck came to the university at Uppsala at age sixteen. It was there that he would spend most of his life, with the exception of a year-long stay at the University of Leiden. Rudbeck held the chairs of both theoretical and practical medicine—his most notable achievement was the identification of the lymphatic system in 1652, in parallel with Thomas Bartholin in Denmark. This was only part of his expertise. Rudbeck was a true Early Modern polymath and was proficient in mathematics, architecture, and music as well as other disciplines. His magnum opus *Atland eller Manheim,* usually referred to by its Latin title *Atlantica,* incorporates mythology, linguistics, archaeology, history, and ethnography into its argument.

At four volumes and three thousand pages, the *Atlantica* is not a work that permits easy summarization. Like many of the sprawling tomes of Renaissance and Early Modern schol-

arship it defies modern disciplinary boundaries, offering conclusions on history, geography, linguistics, genealogy, and religion. It is in essence a work of proto-nationalism, from its subject matter to the choice of language. In an academic world where the use of Latin was ubiquitous, Rudbeck instead wrote in Swedish and commissioned a Latin translation to be published together with the original. The main thesis is that Sweden, especially the old pagan settlement Gamla Uppsala (about five km from the center of Uppsala), is the cradle of civilization.[1]

Rudbeck's argument is not primarily based in biblical reference, as much research at the time was, and he never claims that Sweden was the location of the garden of Eden or that Swedish was the original language spoken by Adam and Eve. However, like many Early Modern writers he connected his nation's earliest origins with the travels of Noah's offspring. He proposed that Japheth, the eldest son of Noah, who during Early Modern times was often seen as the ancestor of the Europeans, migrated from Mount Ararat, up through Russia and into Sweden. Once he was there, a rich culture flourished. During an exodus around four thousand years ago, led by kings who are now remembered as the Nordic gods, Swedish culture and customs influenced the civilizations around the Mediterranean. Some Swedes settled there and eventually became other people, such as Trojans, Persians, and Phoenicians. Rudbeck also counts the Scythians among them, while simultaneously using the ethnonym *Skyter* "Scythians" for the prehistoric Swedes. This could be under the influence of the Scythian hypothesis, which argued that the Scythians were speakers of the mother language of Europe.[2]

The *Atlantica* is thus part linguistic treatise, part sacred geography, part nationalist origin-myth. The Phoenicians appear as supporting players, wheeled on to lend credence to the wider project of cementing Sweden's linguistic and cultural pre-eminence in European prehistory. For the Phoenicians, this was a familiar role. They had been playing it for centuries in a succession of nationalist epic histories and sacred geographies aimed at forging legitimating links between the prestigious pasts of the Old Testament and classical history and contemporary European nation-states and the monarchs who controlled them.

One might easily draw parallels between Rudbeck's project and that of the late fifteenth-century historiographer and fabulist Annius of Viterbo, whose *Antiquitates* (1498) sought to overturn the traditional supremacy of the Greeks and Romans in narratives of human civilization by positing a direct connection between the Etruscans and Noah.[3] Annius's work cast his native Viterbo as the crucible of postdiluvian Europe and its eclipsing by Greece and Rome as both a lamentable fall and a cruel rewriting of history (Stephens 1989: 98–138; Grafton 1993: 77–78; Collins 2000).[4] This type of argument was common during the early modern period throughout Europe. From Goropius Becanus (1519–72) in the Low Countries (Krop 2016: 109–14) to Vassily Trediakovsky (1703–69) in Russia (Breuillard and Polouektov 1994), biblical genealogy is used to back up claims of specific populations, countries, and languages being particularly ancient. The roots of much of this can be found in the

1. This is calculated between the church at Gamla Uppsala, adjacent to the Vendel Period burial mounds, and the Gustavianum, the main university building during the seventeenth century. Rudbeck planned and led the building work to add an anatomical theatre to the building. The Gustavianum now serves as the university museum.

2. This is seen by some as the scholarly ancestor of the Indo-European hypothesis (Gren-Eklund 2007: 26–27; Campbell and Poser 2008: 19; Burman 2017: 81).

3. Rudbeck was aware and fond of Annius, but accepted that his work was based on forgeries (Rudbeck 1698: 37; Wifstrand Schiebe 1992: 66).

4. Although the formerly lost or fragmentary sources presented by Annius were soon recognized as forgeries, their impact was undeniable. Guillaume Postel based his *De Etruriae Regionis quae prima in orbe europaeao habitata est* (1551) on Annius's material (Kuntz 1981: 37 n. 113; Bouwsma 1957: 46).

political and religious rivalries of the day. Scholars were both themselves sincerely religious and also keen to appeal to the legitimatory agendas of their patrons, whether they be ecclesiastical or temporal.

Near Eastern evidence—both real and invented—played a big role in constructing and justifying these world histories. It goes without saying that the Bible and surrounding Jewish traditions were a key touchstone, but there was also an increasing willingness to draw upon extra-biblical sources from the East. Central to Annius's roster of forged ancient sources were the Egyptian Manetho and the "Chaldean" (that is, Babylonian) Berossos, both in reality only known in fragments cited by classical writers. The Phoenicians were brought into the discussion in earnest in the later sixteenth century, with the linguistic discussions of Guillaume Postel (1510–81) and his student Joseph Scaliger (1540–1609). Much of this concerned the Phoenicians' role as transmitters of Levantine civilization to Europe, and in particular the Phoenician writing system's status as intermediary between the Hebrew of the Bible and the Greek and Latin scripts of the classical world. Even without Phoenician epigraphic evidence from which to draw, this seemed clear: Postel had recognized the resemblance between Samaritan writing and Greek and correctly concluded that the letters used by the Samaritans must represent a survival of a form earlier shared with the Jews (Grafton 1993: 629).

This idea led Scaliger to depend on cognates between languages with a directly attested historical link, preferring contemporary and native historical accounts, even if they came from pagans, over more removed sources with better religious credentials. Scaliger's principal discussion of Phoenician comes in his commentary on the *Chronicle* of St. Jerome, where he devotes a lengthy digression to comparing the Greek and Roman alphabets with the Phoenician (inferred from Samaritan). He rightly argued that the latter was used originally throughout Canaan before the development of the square Hebrew script (Scaliger 1658: 110; Grafton 1983: 176; Grafton 1993: 628–29). The Phoenician inspiration of the Greek alphabet was mentioned already in ancient sources such as Herodotus (*Histories* V.58.2), but this was the first time the ancient account had been verified using something approaching modern philological techniques and epigraphic evidence.

The first full-length work devoted to the Phoenicians was Samuel Bochart's *Geographia Sacra* (1646).[5] Similar to the *Atlantica* in its massive scope, this sought to describe all the peoples descended from Noah, and as such dissolved the ever-porous boundaries between sacred geography and world history. More pertinently, its entire second part was devoted to Canaan. The first of its two books deals with the history and geography of Phoenician expansion into the West; the second addresses the Phoenician language. In many ways, the *Geographia Sacra* sets the pattern for the predominant modes of engagement with the Phoenicians to this day: focus on their maritime voyages and impact on the classical world on the one hand; the Phoenician language's linguistic and philological relationship with Greek and Hebrew on the other.

Bochart was a Protestant cleric at Caen, and, unlike Scaliger and Rudbeck, took the Bible as the supreme source. He was a keen etymologist, and found misbegotten Phoenicianisms everywhere. Despite these shortcomings, Bochart brought not only a direct focus on the Phoenicians which had previously been lacking, but also prodigious direct expertise in several Semitic languages: Hebrew, Arabic, and Syriac evidence were all brought in alongside the Phoenician, Greek, and Latin (Shalev 2012: 30). His *Geographia Sacra* achieved great success across Europe, significantly raising the prominence of the Phoenicians in the schol-

5. For a more thorough discussion of Bochart and his scholarship, see Shalev 2012; Delcor 1991.

arly consciousness and securing their reputation as itinerant Semites who could be imagined anywhere, presenting a ready solution for linking almost anywhere in Europe with the classical and biblical pasts.

This ubiquity seems to have been met with particular enthusiasm on Europe's northern margins, where the distance from the East Mediterranean made attempts at forging such links, such as wandering Trojan refugees, somewhat unsatisfactory. In 1652, soon after the publication of the *Geographia Sacra*, Bochart made a rare excursion from Caen to take up an invitation to spend time at Queen Christina's court (Shalev 2012: 190). During this stay, he crossed paths with Rudbeck. Forty years later, Rudbeck recounts hearing Bochart speak on the myth of Cadmus and Hermonia at a scholarly gathering assembled by the court physician Pierre Bourdelot (Eriksson 2002: 55; Rudbeck 1698: 26–27).

In Britain, there had been earlier attempts to rope the Phoenicians into the construction of a national origin-story, most notably that of John Twyne (ca. 1505–81), but Bochart inspired a new wave of adherents keen to identify Phoenician influence on their own land. Aylett Sammes drew heavily and uncritically from Bochart in his own etymology-fueled fantasy of a connection between Welsh and Phoenician (Brisby 2009: 2; Gerritsen 2012: 186–87). He, in turn, inspired still more outlandish concoctions, such as Charles Leigh's notion of a New Canaan in Lancashire's Ribble Valley or William Stukeley's theories of the Tyrian origins of the Druids (see Shalev 2012: 194; Parry 1995: 308–30; Piggot 1986: 116; Quinn 2018, especially chapter nine).

Rudbeck's work comes at a time of transition for Phoenician studies. Bochart has been seen by some as the beginning of the discipline, but despite the great popularity he brought, in many ways the wave of followers he spawned marks the final phase of the largely Protestant nationalist-historical and sacred-geography mode of Phoenician research. Rudbeck's work comes toward the end of this, merely a few decades before gradually increasing epigraphic evidence and Barthélemy's decipherment of the language inaugurated a new era in which the Phoenicians could for the first time be approached on their own terms though direct sources.

RUDBECK'S PHOENICIANS: ORIGINS AND APPEARANCE

Rudbeck spends more time on discussing the Phoenicians than the other people he includes as descendants of the "Scythians." Much of his discussion of their origins centers around the color red, which is often associated with the Phoenicians in both ancient and modern discussions. There was an ancient belief, most famously reported in Herodotus I.1, that the Phoenicians were from the ἐρυθρά θαλάσσα 'red sea'. This is generally interpreted as meaning the Persian Gulf,[6] although elsewhere (e.g., Demosthenes XIX.304), the "red sea" was clearly an archetypal far-off country that was ill-understood. The ethnic "Phoenician" is frequently connected to the Greek word φοινός 'blood-red'.[7] In modern times, the most common explanation of this is the color of the purple dye famously exported from Phoenicia, but sometimes modern scholars bring up the possibility that it is related to Phoenician appearance.[8] Rudbeck combines this argument and the Phoenicians' association with the

6. According to Liddell and Scott 1940, s.v. ἐρυθρός, Herodotus was not aware of the Persian Gulf but meant what we now call the Red Sea. This is not supported by the rest of the text.

7. On the etymology of φοινός, see Chaintraine 2009: 1220.

8. The first modern scholar to suggest the explanation based on skin color appears to be Pietschmann 1889: 107. It is mentioned in Speiser 1936: 122, but is not given any credence. It is exceedingly rare to find it discussed or mentioned in twentieth-century scholarship, but it is still mentioned as a possible alternative, along with references to purple dye, in both Salles 2012: 1139 and Bryce 2016: 172.

Red Sea to support his preconceived notion of the origin of the Phoenicians in the far north (Rudbeck 1698: 696).

His argument is two-fold. The first is geographical. He rejects the idea that the ἐρυθρά θαλάσσα is either the Persian Gulf or the modern Red Sea, observing that it is impossible to sail from the Red Sea to the Mediterranean without having to circle the entire continent of Africa. Such a dangerous trip would be foolish if one did not know where one was going.[9] Based on this, it made more sense to Rudbeck that the Phoenicians would have lived to the north, in the Baltic, as it is far closer by sea.

His second argument is linguistic. He rejects that ἐρυθρός means 'red', ignoring (or being unaware of) instances where the word is used in reference to bronze, gold, and blood.[10] Instead, he argues it is an example of Greeks misunderstanding the Swedish sentence:

> inom Eira-Sund är inra hafwet, ock burtom Eira Sund Er ytra hafwet
> within Öresund is the inner sea, and beyond Öresund is the outer sea (Rudbeck 1698: 696)[11]

The two words *Er ytra*, 'is' and 'outer', were misinterpreted by the listener as *Erytra*, i.e., ἐρυθρά.

However, he is also keen to connect ἐρυθρός with the Phoenicians' physical appearance, and in these cases he does interpret it as 'red'. He quotes Strabo I.35, where the Persian Gulf is described as ἐρυθρός 'red', but Rudbeck suggests instead that the adjective refers to the Phoenicians' hair (Rudbeck 1698: 695).[12] He renders ἐρυθρός as *Gulröd*, 'yellow-red', which may mean 'orange'.[13] Later on, he claims that the word "Phoenician" means "the color that is light, bright red, and yellow like the Sun"[14] (Rudbeck 1698: 749). He also argues that the Phoenicians have red skin, which is also how he describes the complexion of northern Europeans (Rudbeck 1698: 717).[15] His main source is the Roman comedy *Poenulus* by Plautus, which features the Phoenician character Hanno. Rudbeck assigns the entire passage to the character Milphio: "What is this bird, that comes wearing a coat? Might he

9. Rudbeck must have been unaware of the ancient sources describing Phoenician voyages around Africa. Herodotus (*Histories* IV.42) describes a Phoenician expedition sponsored by the Egyptian pharaoh Necho II (610–595 BC) to circumnavigate Africa from the Red Sea to the mouth of the Nile. Another Phoenician African expedition is attributed to the Carthaginian Hanno, whose voyage down the West African coast is recorded in a Greek periplous and referred to by Herodotus (*Histories* IV.196) and Pliny (*Natural History* II.169). The extant text has been interpreted as describing the Punic sailors reaching around as far as Senegal, but in this case there is no indication of a full circumnavigation.

10. Ἐρυθρός is used for bronze at *Iliad* XIX.265, gold at Hesiod, *Theogony* 450, and blood at Aeschylus, *Eumenides* 265.

11. All translations from Rudbeck's *Atlantica* are by A. Burman.

12. Rudbeck's interpretation of the Strabonian passage makes very little sense, which supports the observation that his knowledge of Greek was poor (Nelson 1947: 760; Burman 2017: 87). However, it may also be explained by a tendency to careless reading. In the same passage, Rudbeck quotes Bochart, making it sound like he thinks ἐρυθρός should be taken as meaning 'red', but in fact he only quotes part of his argument. Bochart goes on to say that this sea is not named after its color but after the Hebrew king Erythras, i.e., Edom, the royal name of Esau, which incidentally means 'red' (Bochart 1681: 341).

13. The adjective "orange" is first attested in Swedish in 1654, but is then not found until 1840 (see *Svenska Akademiens Ordbok*, s.v. *orange* II). The more common term into the twentieth century was *brandgul,* literally 'fire-yellow'.

14. "den färgen som är lius, högröd och gål som Solen."

15. In the first volume, Rudbeck speaks of Scandinavians being "vita till hull och hår" "with white skin and hair," but in the third volume, he instead conceptualizes skin color on a spectrum of red and black/blue (Rudbeck 1698: 694).

have come out of the baths? Yes indeed his face is nice and red"[16] (Rudbeck 1698: 733). This bears little resemblance to the original, which is a dialogue between Milphio and Agorastocles. Only the first clause is correctly rendered by Rudbeck.

MIL Sed quae illaec avis est, quae huc cum tunicis advenit?
numnam in balineis circumductust pallio?
AGOR Facies quidem edepol Punicast.

MIL But what is this bird, who comes wearing a tunic?
Do you think he had his cloak stolen at the baths?
AGOR By Pollux, he looks like he's Punic.
(Plautus, *Poenulus* 975–77)

The mention of the baths has nothing to do with Hanno's skin color, but is about the fact that he is not wearing a cloak (not mentioned in Rudbeck's rendition). The baths would be an obvious place to lose a piece of clothing, as it would be left unattended. However, Rudbeck claims that when someone is *mycket rödbrusigh* 'very ruddy', it is a common idiom to say that the person looks like he has come straight from *Badstugan*—a Scandinavian sauna (Rudbeck 1698: 734).

Thus Rudbeck's argument is that the Swedish origins of the Phoenicians are proven by their supposed red complexion, which differentiated them from the neighboring peoples with darker complexions. Notably, this goes against Rudbeck's explanations of human phenotypes in the first volume of the *Atlantica.* There, he criticizes the Dutch historian Georgius Hornius's claim in *De Originibus Americanis* (1652) that hair color is hereditary, and argues that changes in phenotype are the result of environment, temperament, and health. According to this theory, appearance cannot be used to prove heritage, as it will change depending on the environment. Therefore, it should only be possible to use this argument in relation to the actual people who emigrated, as when Rudbeck brings up Athena's epithet γλαυκῶπις, which he renders as 'blue-eyed' and compares to Scandinavians (Rudbeck 1698: 681).[17] Rudbeck's argument from the first volume is not useful when discussing their distant descendants.

It is difficult to tell if Rudbeck had changed his mind about the origin of phenotypes or held contradicting views. The first and third volumes of the *Atlantica* were written some twenty years apart, giving him plenty of time to reconsider, either because of some evidence or simply for the convenience of the Phoenician argument. There is also the possibility that he did not see this as a contradiction. He may have seen Swedish/Scythian/white features as more "resilient" and therefore more likely to survive even under environmental pressure. However, it is also possible that Rudbeck put aside his earlier belief in order to use this particular argument.

RUDBECK'S PHOENICIAN: SCRIPT

When Rudbeck first discusses the Phoenicians in the first volume of the *Atlantica,* his focus is on writing systems. In his mind, the Greek, Latin, and Phoenician scripts are all descended from Scandinavian runes.[18] He cites Priscian, Pliny, and Plutarch, who state

16. "Hwar är denna för en Fogel, som kommer i en Råck gånganeds? mån han hafwer kommit uhr Badstugun? Ja ha hans Ansickte är sannerligen fiint och rödt[.]"

17. The epithet γλαυκῶπις is often translated as 'grey-eyed' or 'with gleaming eyes', although sometimes as 'blue-eyed' (Liddell and Scott 1940, s.v. γλαυκός, γλαυκῶπις).

18. Notably, Rudbeck does not argue that runes are the first writing system, as he mentions antediluvian inscriptions (Rudbeck 1698: 11), which he may have seen as Hebrew, a writing system he views as separate from the Runic

that the Greek alphabet originally had sixteen characters, the same number as the Younger Futhark (Rudbeck 1679: 835).[19] Much of the discussion is dedicated to the question of the direction of this relationship. If the Scandinavians had got their writing system from Greek (at least after the Trojan war, when additional letters were supposedly added, cf. Herodotus, *Histories* V.58; Pliny, *Natural History* VII.192), there would have been twenty-four runes, not sixteen (Rudbeck 1679: 838). He argues against the idea that the Greek script comes from Phoenicians for similar reasons, and that Phoenician "had seven other [characters] that were not among the Greeks"[20] (Rudbeck 1679: 847).

Having discussed the origin of the scripts, Rudbeck moves on to show how the Younger Futhark turned into Greek and Phoenician scripts. His labeling of Phoenician graphemes is based on Greek, leading to him reading *aleph* as /a/ (in fact [ʔ]), *ʿayin* as /o/ (in fact [ʕ]) and *šin* as /s/ (in fact [ʃ]). Although all characters are included in the table in volume three (see Fig. 1), not all are discussed in volume one, as Rudbeck believes only some are derived from Runic. Here, Rudbeck covers fifteen Phoenician characters, corresponding to fifteen of the sixteen runes of the Younger Futhark. The sixteenth rune, ᚢ, does not have a Phoenician counterpart. Rudbeck sees the fact that "the Phoenicians did not have a *V*" as evidence that Greek, which has the letter <υ>, corresponding to Latin <v>, cannot have been derived from Phoenician (Rudbeck 1679: 847).[21]

Rudbeck's description includes drawings of the characters being discussed, counting the number of end-points of each character (see Fig. 2). A character such as <𐤀>, which has three strokes, has six "ends," two for each stroke. Over time, characters are written faster and become more elegantly rendered. Rudbeck thus sees this rune as the origin for Phoenician *aleph,* which he draws with a rounded belly, unlike the common pointed version: <𐤀>. The two diagonal strokes have been turned into a loop. He frequently characterizes Phoenician lettering with the word *wig*, 'nimble', enough that he criticizes one character (probably a poorly drawn *koph*): "I can see no nimbleness, only the utmost un-nimbleness"[22] (Rudbeck 1679: 845).

He also identifies many characters, such as <𐤓> *res,* which he sees as related to <ᚱ>, as derived from *wändrunor,* literally 'turned runes', i.e., mirrored runes. Rudbeck wonders if this use of mirrored runes, as well as what he claims is *i,* a three-pronged character reminiscent of an *m* with a curved upper part, is an attempt to obfuscate the origin of their script. He never gives any reason why this might be. Already here, he acknowledges a connection between Phoenician and Hebrew, noting that the custom of 'turned runes' led to the Phoenician script getting Hebrew pronunciation (Rudbeck 1679: 848). Despite this connection, Hebrew is clearly seen by Rudbeck as separate from the Runic tradition.

To Rudbeck, the meaning or origin of the Phoenician script is no mystery. He believes it to be readable but rare, as much of the writing has been lost. Although Rudbeck ascribes phonetic values to Phoenician both implicitly and explicitly, it is much more about extrapolation from Greek alphabetic order than strong arguments of Phoenician sound values. Crucially, Rudbeck does not distinguish between written and spoken language. He demonstrates

tradition. Rudbeck dates the oldest rune stones to 2000 *Anno Mundi* based on stratigraphy (Rudbeck 1679: 849) or four to five hundred years after the Great Flood (Rudbeck 1679: 833).

19. The references are not written out, but are probably Pliny, *Natural History* VII.192; Prisican, *Grammatical Institutions* I.12; Plutarch, *Platonian Questions* 1009f. He does not appear to be familiar with the Elder Futhark, but assumes the Younger Futhark is the original.

20. "haft 7 andra, som ey woro ibland dhe Grekers."

21. "Phenicerna hade intet *V.*"

22. "kan jag intet see någon wighet utan största owighet uti."

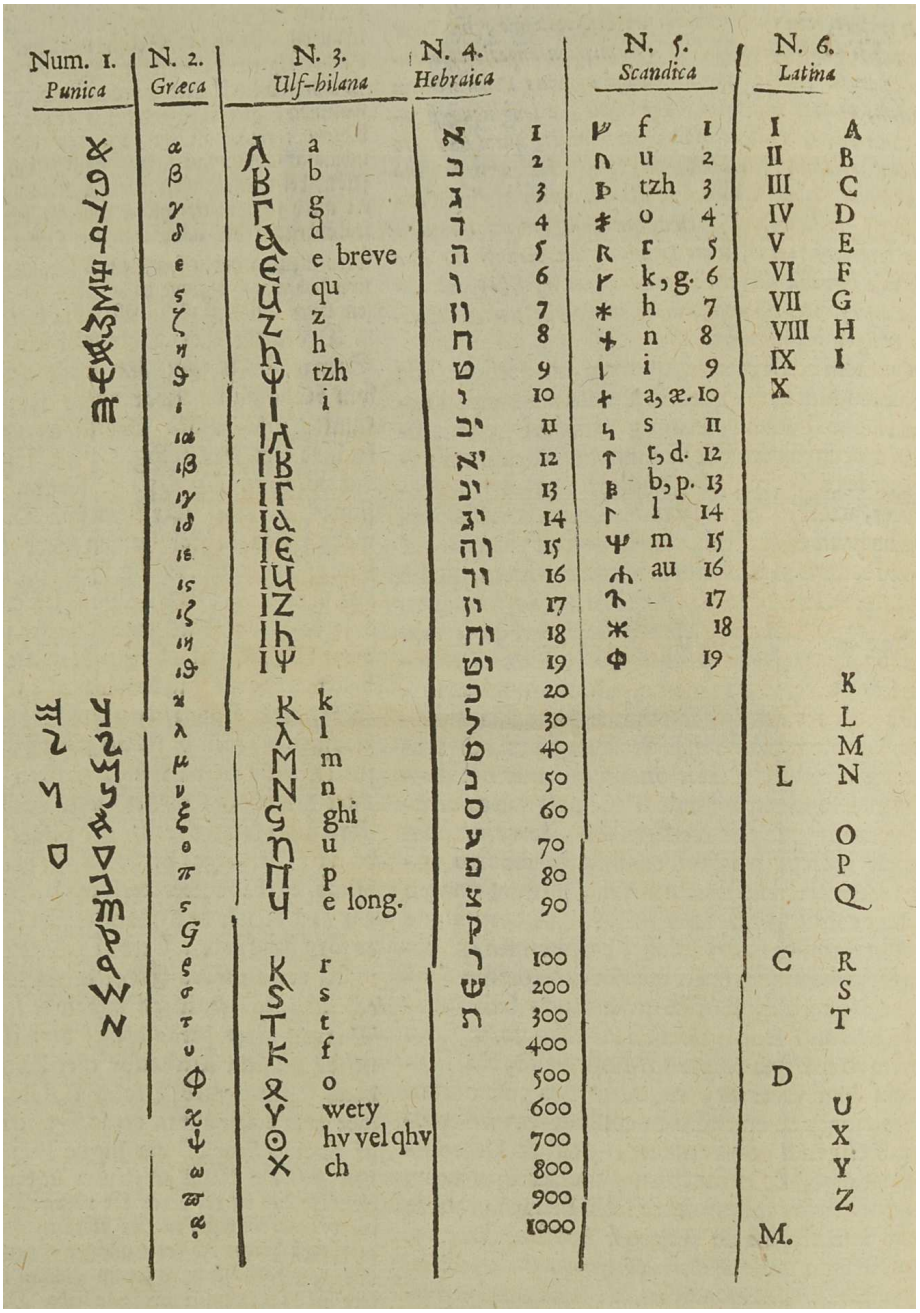

Fig. 1. Table comparing the Phoenician, Greek, Gothic, Hebrew, and Latin scripts and Younger Futhark from Rudbeck 1698: 16, taken from the facsimile in The Swedish Literature Bank, https://literaturbanken.se/forfattare/RudbeckOaldre/titlar/AtlandDelIII/sida/16/faksimil, retrieved March 3, 2020

how Runic <ᚠ> /f/ corresponds to Greek <π> /p/ (Rudbeck 1679: 840), using words he had previously used to illustrate the variability between /f/ and /p/, including several true cognates such as Swedish *fader* and Greek πατήρ 'father', Swedish *fut* and Greek ποῦς 'foot' (Rudbeck 1679: 19). Rudbeck sees the written form and the spoken as intrinsically linked, meaning that the observable relationship between Swedish /f/ and Greek /p/ in many words

can be applied to the Runic and Greek graphemes too. When Rudbeck lines up the Phoenician, Greek, Gothic, Hebrew, Younger Futhark, and Latin scripts, he is not interested in the values of the individual characters, but the general similarity in form (Rudbeck 1698: 16).

Both the passages discussing Phoenician scripts are isolated from Rudbeck's discussion of Phoenicians as Scythian descendants. When dealing with the Phoenician language, his sources are all onomastic or from Graeco-Roman accounts. However, he is acutely aware of the potential of evidence being lost and unrecoverable. In the opening of volume three, he refers to Josephus's story of the children of Seth who erected two inscribed pillars outlining astrological observations (*Ant* I.70), and points out that as these pillars are not preserved, we cannot use them, but "only talk about those [inscriptions] that are [copied] in books or inscribed and chiseled into stones, metal or wood"[23] (Rudbeck 1698: 11).

During his main discussion of Phoenicians, after twelve pages of tables comparing Scythian and Phoenician words, Rudbeck addresses the question of inscriptions: "[I]f we had some complete Phoenician texts, like those we have of the languages of other old peoples, I am sure we could make this much more complete, but now one has to make do with the things taken from here and there in scholars' books, who here and there mention some words that they received from them"[24] (Rudbeck 1698: 730). During Rudbeck's lifetime, Phoenician and Punic inscriptions had been found, although they remained little known until the second quarter of the eighteenth century.[25] This serves to emphasize the time it could take for discoveries to be recognized in the centers of European scholarship. Even when studies were available, scholars like Rudbeck still relied on early modern trade routes and books could take years to be delivered.

23. "nu allenast tala om sådanna som i dag antingen i Skriffter eller på Stenar, Metall eller Trä hugne och stuckne äro."

24. "hade man några fullkomlige Phœniciska Skriffter, såssom man uti andra gambla Folkz språkhafwer, så är iag säker att man det än mycket fullkomligare göra kunde, men nu måste man låta sig nöja med det man här och där tagit utur de Lärdas Böcker, som här och där nämna några ord hwilka de bekommit ifrån dem."

25. The Phoenician/Greek bilingual *cippi* from Malta, which Barthélemy later used to decipher Phoenician, were likely discovered sometime in the late seventeenth century, although the exact circumstances are unclear. Barthélemy (1764: 406) states that "For a long time two marbles have been preserved in Malta … Neglected by the Vice-Chancellor Abela, who had published the antiquities of this island, ignored by the rest of Europe, they were brought from this obscurity around 1735 by M. the Commander de Marne" (translation by P. Boyes).

RUDBECK'S PHOENICIAN: LANGUAGE

Rudbeck's main argument in favor of Phoenicians being descended from the Scythians is linguistic. He argues that two peoples who live in different places but speak the same language must be the same people (Rudbeck 1698: 719). A point Rudbeck returns to frequently is his belief that Phoenician and Hebrew, and by extension the people who spoke them, are not the same. Some arguments are taken from the Bible, such as when Rudbeck brings up the Jewish custom of not shaving or cutting one's hair and the prohibition of idolatry, things that he asserts the Phoenicians do. Other characterizations of the Jews in Rudbeck's work appear extrapolated from biblical stories, such as that they, unlike the Phoenicians, did not trade by sea. Other points, such as the claim that Jews were not supposed to mix with other peoples, may be rooted also in Rudbeck's understanding of contemporary Judaism, which was likely to have been sketchy. Jews were seldom allowed to settle in Sweden, despite multiple attempts, although the law forbidding immigration of non-Christians without baptism was not introduced until 1686. At most, he may have had dealings with individual Jewish scholars in Leiden, and may well have crossed path with Queen Christina's Jewish doctor Benedictus de Castro when he was invited to do anatomical demonstrations at court in 1652.

While Rudbeck rejects the idea of Hebrew and Phoenician being related, he does not deny the similarities between the languages. Instead, he explains them as the result of language contact (Rudbeck 1698: 719, 730, 752). Rudbeck suggests that these loans caused Bochart to attempt to shape the Punic monologue in Plautus's *Poenulus* into something more Hebrew-like (Rudbeck 1698: 730).

The Bible is generally absent from his discussion of Phoenician. In dismissing the genetic connection between Phoenician and Hebrew, Rudbeck approaches the Phoenicians from a perspective different from Bochart's biblical one, allowing other avenues to be explored. Rudbeck's secularized approach can be seen in much of his life, most clearly his involvement in the Cartesian contentions in Uppsala, where the debate regarding the influence of the Bible on non-religious matters raged. Although his conclusions are strange to us, his approach to the Phoenicians as their own people outside the biblical paradigm is more modern than that of his contemporaries. Rudbeck also differs from other scholars of his time through the emphasis on language contact as a valid avenue of change (Rudbeck 1698: 160; Burman 2017: 88). He has no patience with the rejection of the importance of loanwords, observing that the ancients were not ashamed of the existence of Scythian loanwords in their language. The situation now, he says, is different. As soon as someone "starts dipping his nose into Greek, Latin, or Hebrew," he attempts to derive everyone else's languages from them, "as if there are no languages other than these in the world"[26] (Rudbeck 1698: 737).

In order to show that Swedish and Phoenician are one and the same, Rudbeck gives twelve pages of comparative material between "all the noblest languages"[27] (Rudbeck 1698: 719). This encompasses some 250 entries. Rudbeck later implies that there are far more, and that listing them all would require a book as long as the whole of the *Atlantica* (Rudbeck 1698: 736). Rudbeck argues that his material proves that Phoenician is descended from Swedish "since the words agree"[28] (Rudbeck 1698: 730).

The material in the first column, marked "Scythian or Swedish," includes both actual Swedish words and names, and hypothetical forms clearly influenced by the Phoenician

Fig. 3. Table of "Scythian," Phoenician, German, Hebrew, Greek, Latin, Slavic, and Finnish. Rudbeck 1698: 719, taken from the facsimile in The Swedish Literature Bank, https://litteraturbanken.se/forfattare/RudbeckOaldre/titlar/AtlandDelIII/sida/719/faksimil, retrieved March 3, 2020

glosses. For instance, *Thor, Taur*, and *Tharan,* all variants of the same Norse theonym, look suspiciously like the supposed Phoenician words *Taran* and *Thoor,* for which Rudbeck gives Eusebius as a source (Rudbeck 1698: 729).[29] Scythian here represents the ideal pre-form of Swedish. This column frequently includes references to this and previous volumes of the *Atlantica*. The second column is Phoenician. Most words have references, the most common being to Bochart. There are also references to ancient sources such as Festus, Hesychius, and Plautus, and early Christian sources, such as Eusebius and Julian the Apostate. The other six columns are German, Hebrew, Greek, Latin, Slavic, and Finnish. These columns never include sources to the words. Sometimes, one or more of these six columns are left blank or

29. The reference is likely to Eusebius's *Preparation for the Gospel* I.10, which mentions the supposed Phoenician god *Tauthus* and the Egyptian *Thouth.* The <o> form is thus not glossed as Phoenician by Eusebius, but is still given since it looks rather like the Swedish *Thor.*

marked with dashes (cf. Rudbeck 1698: 725). If there is a difference between these ways of marking the lack of a corresponding word, it is not made clear.

When the modern linguist looks at Rudbeck's table, the immediate instinct is to approach it as comparative material. However, it is not often that all the material matches. The truly comparative material is found in the two first columns, Scythian/Swedish and Phoenician. The others serve rather to show the dissimilarities. It cannot be a coincidence that Hebrew, Greek, Latin, Slavic, and Finnish are all identified elsewhere as *Hufwudspråk* 'main languages', Rudbeck's version of the mother languages in modern linguistics. Thus this can be seen more as the translation or explanation of these words than comparative material in itself. Often the Latin is the most literal translation of the Swedish. This use of Latin for glossing is seen later in volume three, when he discusses Phoenician and Swedish placenames (Rudbeck 1698: 740–49).

Bochart is without doubt Rudbeck's most commonly cited source in the table, being cited for ninety-three words, most often as the only source. His use of the material is at times eclectic. In some cases, Rudbeck cites a word as Phoenician that Bochart connects to another language, particularly Hebrew, but also Syriac, Chaldean, and Arabic.[30] Usually, when a reference to Bochart exists in the Phoenician column, words in the Latin column tend to be taken from Bochart too. Sometimes, the words are simply similar, e.g., Bochart's *libidine ardere* and Rudbeck's *libidiose ardere* (Bochart 1681: 370; Rudbeck 1698: 719). Elsewhere, the same Latin words appear, e.g., *arx* (Bochart 1681: 583; Rudbeck 1698: 724) and *coercere* (Bochart 1681: 602; Rudbeck 1698: 726). However, Rudbeck tends not to engage with the Hebrew material in Bochart in his Hebrew column. The reference is always given in the Phoenician column.

At times, Rudbeck interprets Bochart's material very freely. The reference to Bochart supporting "Phoenician" *Ura* leads only to a discussion of the name *Urania* (Bochart 1681: 371; Rudbeck 1698: 729). Elsewhere, he gives a Phoenician word as *kachar,* which Bochart gives as *chacra* (Bochart 1681: 602; Rudbeck 1698: 724). Some page numbers are incorrect, as when he cites a page of Bochart containing the word *daula* (instead of *daal,* which Rudbeck quotes).[31] In some instances, we have been unable to find the material Rudbeck ascribes to Bochart. It is possible that they are fabricated, but Rudbeck does not mind giving words without references, making this unlikely. He may simply have referred to different editions of Bochart.[32]

30. The Hebrew words taken as Phoenician by Rudbeck are *kar* (Bochart 1681: 405; Rudbeck 1698: 725), *hall, halmis* (Bochart 1681: 391; Rudbeck 1698: 723), and *car* (Bochart 1681: 405; Rudbeck 1698: 724). The Syriac words are *marnas* (Bochart 1681: 824; Rudbeck 1698: 726) and *nesib* (Bochart 1681: 827; Rudbeck 1698: 726). *Rheda* is Phoenician in Rudbeck 1698: 729 but Chaldean in Bochart 1681: 746–47. Rudbeck 1698: 729 gives *tya, teja* as Phoenician, while Bochart 1681: 829 gives Arabic *taier*, from the root *tair.* Arabic also appears in Bochart's discussion of the etymology of *Camulodunum* (Bochart 1681: 755), which he claims is derived from Arabic *kamala, kimal* 'master'. Rudbeck gives *gimala, giemala, kamala* in the Phoenician column for Scythian/Swedish *hamala, giomala, gumme* (Rudbeck 1698: 723).

In a notebook (held at R13 Carolina) of Rudbeck's containing comparative lists much like the one found in Rudbeck 1698: 719–29, he includes Chaldean, Egyptian, and Arabic in this column. His stance on the origin of Arabic and other Afro-Asiatic languages is unclear.

31. Rudbeck 1698: 722 claims *daal* is on p. 735 of Bochart 1681, while it is in fact on p. 440.

32. Most references align with the 1646, 1651, and 1681 editions. For the sake of simplicity, we refer to the 1681 edition, which fits the whole of *Geographia Sacra* into one volume. The Aurivillius catalogue of Uppsala University library, which lists volumes in the university library in 1796, lists only the 1692 volume, where the page numbers differ from the 1681 edition considerably. This indicates that this version was either acquired after Rudbeck's work on Phoenician and the university owned an earlier edition that he used, or that Rudbeck had his own copy, which he preferred to the university's 1692 edition.

Rudbeck cites very few other contemporary authors. After Bochart, the most common is the Dutch cartographer Jans Janssonius (1588–1664), who is cited for sixteen toponyms (Rudbeck 1698: 720–24, 726, 728–29). The English Hebraicist John Selden (1584–1654) is cited four times (Rudbeck 1698: 719, 721–22). Scaliger (Rudbeck 1698: 719) and the Swiss botanist and doctor Caspar Bauhin (1560–1624) (Rudbeck 1698: 723) are cited for one word each.[33] The majority of the sources cited are ancient. These include Hesychius, Macrobius, Josephus, and Livy. He also cites both the epitomizer Festus and the fourth-century CE writer Festus Avenius, but appears to see them as one and the same.[34] He also includes eighteen words ascribed to Plautus, all of which are found in the first five lines of Hanno's Punic speech, discussed below. Early Christian and Byzantine writers such as Jerome, Tzetzes, and Eusebius also feature. Frequently, Rudbeck does not give specific references, but only puts down the author's name, as was common at the time.

Throughout this table, Rudbeck is liberal with the meaning of the words. He gives *Aphaca* as Phoenician for 'Venus s[iue] Terra', citing Eusebius where there is a mention of a place called Aphaca, where there is a temple to "the hateful demon Aphrodite" (Eusebius, *Life of Constantine* III.55.2, quoted after Cameron and Hall 1999: 144.) When aligning the gloss *Arc* with words meaning 'ship', his source is the *Argonautica Orphica*, apparently in reference to the ship *Argo* (Rudbeck 1698: 720).[35] This tendency is seen several times in Rudbeck's use of toponyms found in Bochart, where the words in the six last columns are all the same, meaning 'town' or 'city' (see Table 1). Rudbeck may well have been aware that words meaning 'town' or 'market' were common place names, such as *köping* 'market-town', which appears as a toponym, on its own and in compounds, throughout southern and central Sweden. However, he has turned this on its head and approached every toponym as a possible word for 'town'.

As with his etymologies elsewhere, Rudbeck's comparisons between Scythian and Phoenician allow for a lot of difference. Both vowels and consonants are frequently exchanged. In the first volume, he sketches out common routes of language change, including some now well-known mechanisms such as contraction and metathesis. He also observes that some changes happen more easily than others, such as changes between stops with the same point of articulation (Burman 2017: 85). The idea of regular and exceptionless language change is not one Rudbeck is familiar with, but he believes that there are changes that are more likely to happen than others.

The most extensive "Phoenician" text Rudbeck and his contemporaries had access to was Hanno's Punic speech in Plautus's comedy *Poenulus*. It was transmitted with an accompanying Latin text, which has now been shown to be generally correct (Gray 1923; Gratwick 1971, 1972; Krahmalkov 1988). Like Bochart before him, Rudbeck makes use of this Latin interpretation and attempts to analyze the Phoenician. Of the eleven lines of Hanno's speech, Rudbeck discusses four and a half of them (*Poenulus* 930–33, 939). All eighteen words in the table of comparison whose source is given as Plautus are from these lines. Rudbeck

33. Despite only citing him once in the table, Rudbeck praises Scaliger elsewhere for his learnedness (Rudbeck 1698: 730).

34. Rudbeck cites Paulus-Festus, two epitomes based on the Augustan antiquarian Marcus Verrius Flaccus's *De Verborum Significatu,* twice. One, given as *mappula, mamphulla* by Rudbeck 1698: 726, is described as Phoenician in the source (Festus 132–33L, *mapalia*), which is not the case with *abyle* (Rudbeck 1698: 720), given as *abynes in* Paulus ex F. 17L. Rudbeck cites Festus Avenius's *Descriptio Orbis Terrae* (lines 98–103, 615)*,* a translation of a Hellenistic geographic poem by Dionysius Periegetes, in relation to the toponym *Gadir* twice, once at length (Rudbeck 1698: 699–702) and the other in the table of glosses (Rudbeck 1698: 722).

35. The Phoenicians are never mentioned in the *Argonautica Orphica.*

Table 1. Three examples from Rudbeck's Phoenician table of words purportedly meaning 'town'

Scythian/ Swedish	Phoen.	German	Hebrew	Greek	Latin	Slavic	Finnish
Holb	olbo, obla	stat	ir kiriah	polis	civitas	mestu	caupungi
Tun, tunum, tuna	tuna	stat	ir kiriah	polis	civitas	mestu	caupungi
Thaeby	Thebe	stat	ir kiriah	polis	civitas	mestu	caupungi

Note: *Holb* = Rudbeck [1698] 1947: 716, *tuna* and *Thaeby* Rudbeck [1698] 1947: 718. In the original, references to Bochart are included in the Phoenician column: *olbo* Bochart 1681: 463, *tuna* Bochart 1681: 390 and *Thebe* Bochart 1681: 463.

gives his own version of the Latin interpretation, which means roughly the same as the text found in the manuscripts, but has different wording and is in prose rather than verse. The reason for this is probably that Rudbeck seeks to provide a word-for-word interpretation to support the way he has broken up the text. He argues that the text, which has survived in *scripta continua*, has multiple instances of elision. In the first line, he interprets *Thalonim* as *The Alonim*. Generally, his rendition of the Punic lines is the same as in the *Poenulus*, with two exceptions. All manuscripts give the beginning of *Poenulus* 930 as *Ith* or *Yth*, while Rudbeck gives *Ni th*, with an extra <n>, making it look more like the Swedish first person plural pronoun, which during Rudbeck's lifetime had started shifting from *I* to *ni.* In line 934, he renders an <m> as <rn>, reading *byrna* instead of *byma,* making it more like *barna* 'the children' (Rudbeck 1698: 732). This appears to be a case of Rudbeck getting ahead of himself, because in the previous line, he gives *bymi,* which he interprets as the same word, only later reinterpreting it as *byrni*.

Although Rudbeck's approach to language is comparative in many ways, he generally does not create hypothetical forms. His analysis of Hanno's speech is an exception to this. He gives four versions of the first line, meaning "you [gods] above and below, who govern this city" (here given with Rudbeck's italics intact):

1.	*Ni*	*th*	*Alonim*	*Valonji*	*th*	*si*	*cora*	*thissima*	*consith,*
2.	Ni	the	Aloni	Valoni	the	sim	garda	thissima	gansitha,
3.	Ni	de	Aloner	Valoner	the	som	gardarna	thessa	besittia,
4.	*Vos*	*illi*	*Superi*	*inferiq.*	*illi*	*qui*	*urbi*	*huic*	*praeseditis*

(Rudbeck 1698: 732)

The first is Plautus's Phoenician text with Rudbeck's word divisions. Sentences three and four are translations thereof, provided by Rudbeck. It is the second line that is of particular interest. It bridges the gap between the Phoenician and the seventeenth-century Swedish, both filling in elided vowels in the Phoenician (*th* and *the*) and explaining changes in the language (*cora* and *garda*). In the case of the last word, Rudbeck gives the form *gansitha* as a transitional form between *consith* and *besittia,* using a voiced velar to broach the gap between the voiceless velar and the voiced dental. Only twice does Rudbeck refer to words

that are lost.[36] Both times he cites Olaus Verelius's lexicon *Index Linguæ Veteris Scytho-Scandicae sive Gothicae* (1691), which Rudbeck helped edit.

Rudbeck describes this second line as "how our language expresses them [Plautus's verses] in our old texts," but immediately after this he refers to Ulfila's Gothic Bible (Rudbeck 1698: 732).[37] The line is not recognizable as Old Swedish, and seems not intended to be that. Perhaps these old texts are not any extant works, but the runic books Rudbeck claims were burned when Sweden became Christian. The expressed purpose of presenting the versions of this one line is "so that it can be observed how well they align"[38] (Rudbeck 1698: 732). While it is placed in the middle, the second line is not a missing link between Phoenician and Swedish, but is an ancestor. In essence, it is a primitive form of linguistic reconstruction. It only has two supposed cognates, and uses little to no theoretical framework or well-defined methodology, but at its core, its purpose is the same as the proto-language reconstructed by a modern-day comparative linguist. In the words of Roger Lass: "To reconstruct is to reverse time, and make the products of that reversal accessible: as objects of intellectual contemplation, portions of the historical record, sources of new knowledge" (Lass 1993: 157).

Rudbeck does not have asterisks to show what is hypothesized and what is not, and his understanding of the burden of proof is radically different from ours. Furthermore, there is no genetic relationship between Swedish and Phoenician as he proposes. The argument itself is alien, even laughable, to us, but Rudbeck's reasoning that led him there is reminiscent of methods now central to the discipline of historical linguistics.

CONCLUDING REMARKS

The discussion of Phoenician in the third volume is the first to deal with language, rather than the etymology of individual words, since the first volume. His ideas outlined there have now been fleshed out. In the first volume, he discusses "main languages," a concept not unlike language branches. At times one language (e.g., Scythian) will be set up as a main "node." In the third volume, Rudbeck makes statements that rather imply his belief in the existence of a mother language. He observes that it is fascinating that there are words that Phoenicians and "we," i.e., Swedish speakers, share, and have been using in the same meaning for four thousand years, the time that has elapsed since the Scythian exodus (Rudbeck 1698: 734). The next observation is based on the idea that Germans, English, Danes, and Dutch, as well as some Italians, French, and Spaniards are descended from Scythians: "And I think […] that if one found some of their old writings there, one would probably find some words, which could show that they spoke one language"[39] (Rudbeck 1698: 735). As such writings are not available, Rudbeck says he will work to "search for them" (Rudbeck 1698: 735), presumably the words showing that these peoples spoke one language.[40]

Rudbeck advocates caution in this kind of etymologizing, giving an example of an absurd Scythian translation. He reports that on the Indian island Malabar, there is an herb called *Kakka-schiti.* Jokingly, he suggests that this could be from Scythian, as every letter is the

36. The first lost word is *ische* or *hiske* (dialectal *häske* 'family, kin', see Verelius 1691: 119; *Svenska Akademiens Ordbok*, s.v. *häsk*). The second is *Thoihom* 'damage', the reality of which is more unclear. This may be a case of Rudbeck extending the meaning of Swedish *tom* 'empty, poor' to posit the word *Thoi* 'misfortune'.

37. "såsom wårt måhl dhem utförer i wåra gambla Skriffter."

38. "att de kunna sees huru rätt dhe träffa."

39. "Och tror jag wäl […] att der man fingo några af deras gambla Skriffter, skulle man wäl finna några ord, som och kunde wijsa att de hafwa talat ett Språk."

40. "dem efftersökia."

same as Scythian words, even if the words do not mean an herb. He gives an example of a far-fetched semantic argument: "this herb has got its name from the fact that when an ox, cow, or horse eats of it, it cacks and shits"[41] (Rudbeck 1698: 737). Although modern audiences mainly remember Rudbeck for his more far-fetched etymologies and this passage shows a lack of self-reflection, it also shows his sense of scholarly discipline and integrity, even if he was not good at applying this to himself.

Rudbeck's project and methods show both similarities and differences with the prevailing fashions in serventeenth-century Phoenician studies. His work draws from and resembles that of Bochart in its scope and its interest in geography, and is in line with many other works of the time in its patriotic concern with seeking the origins of modern nations in ancient population movements. However, he does not share Bochart's sense of the absolute preeminence of the Bible as a source; his more secular approach to sources is closer to that of scholars like Scaliger. Like him, Rudbeck sees value in a people's own literature as a source for their early history. When dealing with Swedish history, he prefers to use the Eddas and other Old Norse works rather than other sources. His tendency to reinterpret sources to fit into his own history of the Scythians, though academically dubious (to say the least), showcases his understanding that sources cannot be taken at face value. Rudbeck is reluctant to accept anything supernatural or otherworldly that is not found in the Bible, which leads him to reinterpret mythical elements as more prosaic ones, both in Graeco-Roman myths and Old Norse ones. Gods become generals and kings, strange creatures become machines of war and ships.

This goes well with his more hands-on approach to antiquity. He discusses runic inscriptions extensively, and uses archaeology and stratigraphy, especially when proposing chronologies. Rudbeck's interest in language contact puts him apart from his contemporaries, as does his view of the Bible. While Rudbeck was wrong about the relationship of Phoenician and Hebrew, his hypothesis that these two languages are not related but are only similar through contact depends on his view of the Bible as not necessarily central in all instances.

This being said, Rudbeck does not put this methodology into practice throughout his work. When he mentions that he wishes that Phoenician books had survived, it is a comment on the language, not on getting information from a Phoenician perspective. The only Phoenician inscriptions he mentions are coins, which were sent to him by his correspondents, among them Johan Gabriel Sparwenfeld, who conducted a "Gothic tour" to North Africa and southern Europe where he looked for evidence of the Swedish exodus (Eriksson 2002: 429). He does not spend much time discussing them, but only says that they bear "pure Gothic runes"[42] (Rudbeck 1698: 38). We do not know how well preserved these coins were, but even if they were in good condition, Rudbeck's convictions were strong enough to skew his reading. He would have been unlikely to have been able to see any Phoenician inscription longer than coin legends in person. Sweden, despite its new position as a geopolitical power, was still a poor country in both finance and culture. No inscriptions from the Mediterranean would be brought there during the seventeenth century. Rudbeck himself only left Sweden once, when he spent time in Leiden as a young man, long before starting work on the *Atlantica.*

It is partly this geographical isolation that is the reason why Rudbeck does not have a position in the history of Phoenician studies. The isolation was also ideological. Rudbeck's

41. "den Örten bekommit nampn deraf, emedan när en Oxe, Koo eller Häst äter där af, så Kackar och skiter han."

42. "rena Gothiska Runer."

proto-nationalist focus on Swedish prehistory was alienating to scholars abroad and served to hinder wider notice of other parts of his scholarship contained in the *Atlantica*. This is the greatest difference between Rudbeck and many of his contemporaries. The studies of Phoenicians by other European scholars of the seventeenth century tended to concentrate specifically on the Phoenicians. When there was a broader point argued, it would concern biblical narratives or the Graeco-Roman world, both well-established parts of the intellectual framework. Rudbeck uses the Phoenicians, as well as all other peoples he discusses at any length, as a means to an end. This end was to create a prehistory of Sweden that rivaled the geopolitical expansion that had taken place during the seventeenth century. Ultimately, Rudbeck's goal undermined his own broader international legacy.

La vita pubblica e privata degli Ebrei in Egitto nell'età ellenistica e romana.*

BIBLIOTHÈQUE LYON SALOMON-REINACH

La storia degli Ebrei ai tempi di Gesù Cristo è tutt'altro che circoscritta entro gli angusti confini della Palestina: in quasi tutte le regioni della terra allora note erano stanziati nuclei di Ebrei più o meno numerosi e di varia importanza, i quali, come rimanevano stabilmente uniti con la Madre patria, così erano in vitale contatto col mondo non ebraico, assumendo perciò una grande importanza sia per lo sviluppo interiore del-

Christi,

l' Ebraismo, sia per l' influenza ch' esso ebbe sulla cultura degli altri popoli.

Tra le cause di varia indole che favorirono tali migrazioni nel periodo ellenistico-romano, una delle principali va riscontrata nelle relazioni commerciali, che attiravano gli Ebrei verso le regioni limitrofe alla Palestina e specialmente verso le principali città del mondo civilizzato.

I Diadochi, i successori di Alessandro Magno, nell'intento precipuo di consolidare i loro Stati, favorivano in ogni guisa la mescolanza delle varie nazionalità, e in molti luoghi agli immigrati era senz' altro esteso il diritto locale, o venivano concessi speciali privilegi. Sembra così che anche gli Ebrei fossero indotti a compiere emigrazioni in grandi masse. Altre cause favorirono tali spostamenti, fra le quali la situazione molto esposta della Palestina, che diveniva campo di battaglia in ogni conflitto tra Siria ed Egitto. Cosicché, già verso il 140 av. Cr., poteva ben dire la Sibilla del popolo ebraico: « Ogni terra e ogni mare sono pieni di te » (1); negli stessi anni (139-138 av. Cr.), il Senato romano emanava una circolare a favore degli Ebrei, indirizzata ai re di Egitto, di Siria, di Pergamo, di Cappadocia, ecc., e a molte province, stati e isole del Mediterraneo (2): se ne deduce che in tali località dovevano trovarsi in quel tempo Ebrei, e in numero considerevole. Strabone (3) dice, riferendosi ai tempi di Silla (85 av. Cr.), che il popolo ebraico « è ormai giunto in ogni città, e non si può facilmente trovare in tutto il mondo abitato una località che non abbia accolto questa razza e che che non ne sia stata dominata ».

Questa espansione degli Ebrei nella Diaspora viene assai ben descritta nella lettera attribuita da Filone ad Agrippa e diretta a Caligola: « Gerusalemme è la capitale non solo della Giudea, ma della maggior parte dei paesi, per via delle colonie ch'essa ha mandato nelle terre di Egitto... ecc., ecc. » (4).

ÿ Judaism, both for the influence it had on the culture of other peoples.

(2)

Among the various causes that favored such migrations in the Hellenistic-Roman period, one of the main ones can be found in commercial relations, which attracted Jews towards the regions bordering Palestine and especially towards the main cities of the civilized world.

The Diadochi, the successors of Alexander the Great, with the main intention of consolidating their states, favored the mixing of various nationalities in every way, and in many places local law was certainly extended to immigrants, or special privileges were granted. It thus seems that the Jews were also induced to emigrate in large numbers.
Other causes favored such movements, including the very exposed situation of Palestine, which became a battlefield in every conflict

between Syria and Egypt. So, already around 140 BC. Cr., the Sibyl of the Jewish people could well say: "Every land and every sea is full of you" (1); in the same years (139-138 BC), the Roman Senate issued a circular in favor of the Jews, addressed to the kings of Egypt, Syria, Pergamon, Cappadocia, etc., and to many provinces, states and islands of the Mediterranean (2): it can be deduced that there must have been Jews in these places at that

time, and in considerable numbers. Strabo (3) says, referring to the times of Siila (85 BC), that the Jewish people « have now arrived in every city, and it is not easy to find a place in the entire inhabited world that has not welcomed this race and that it has not been dominated by it."

This expansion of the Jews in the Diaspora is very well described in the letter attributed by Philo to Agrippa and addressed to Caligula: «Jerusalem is the capital not only of Judea, but of most of the countries, because of the colonies that it has sent to the lands of Egypt... etc., etc. » **(4).**

Affluirono specialmente colonie ebraiche in Egitto, dove già molti secoli prima di Alessandro Magno si trovavano Ebrei in Elefantina, al confine meridionale verso l'Etiopia, come è stato provato da importanti papiri aramaici venuti alla luce recentemente (1) e dove anzi essi si trovavano anche prima della conquista persiana, cioè del 525 av. Cr.

Secondo il Pseudo Aristea (2) infatti, Ebrei fecero parte dell'esercito di Psammetich (certo il II: 594-89 av. Cr.) nella sua guerra contro gli Etiopi, e fu quando, appunto, molti Ebrei palestinesi si stanziarono, contro la volontà di Geremia, in varie località poste al di fuori del loro paese, per sfuggire ai Caldei.

Altra forte immigrazione di Ebrei in Egitto avvenne durante la dominazione persiana, e così un numero assai rilevante di essi vi rimase, nonostante gli inevitabili assottigliamenti, finché sotto Tolemeo I Lagide, verso il 312 av. Cr., nuove grandi masse di essi furono ivi importate come preda di guerra, mentre in numero minore altri vi affluivano ancora liberamente.

Benché fantastica, è ingegnosa, e certo dovette riuscir cara ai Tolemei, la teoria storica attribuita ad Ecateo (3), secondo la quale Egiziani, Elleni ed Ebrei avrebbero abitato in origine la stessa terra; ma poi i primi, dopo aver subito gravi flagelli da essi attribuiti all'avversione dei loro dèi per gli stranieri, avrebbero espulso gli altri due popoli, e così gli Elleni sarebbero andati in Grecia, gli Ebrei, più numerosi, nella deserta Giudea: in tal modo si fissava un precedente alla convivenza successiva, specialmente in Alessandria (4), delle tre razze.

Ai tempi di Filone, come narra egli stesso, il numero degli Ebrei stanziati in Egitto (5) si aggirava intorno al mi-

Machine Translated by Google

Colonists and Jews especially flocked to Egypt, where already many centuries before Alexander the Great there were Jews in Elephantine, on the southern border towards Ethiopia, as has been proven by important Aramaic papyri which have recently come to light (1) and where indeed they they were also found before the Persian conquest, that is, 525 BC. Cr.

According to Pseudo Aristea (2) in fact, Jews were part of the army of Psammetich (certainly II : 594-89 BC) in his war against the Ethiopians, and it was when, precisely, many Palestinian Jews settled against Jeremiah's will, in various locations outside their country, to escape the Chaldeans.

Another strong immigration of Jews into Egypt occurred during the Persian domination, and so a very significant number of them remained there, despite the inevitable declines, until under Ptolemy I Lagis, around 312 BC. Cr., new large masses of them were imported there as war prey, while others in smaller numbers still flowed in freely.

Although fantastic, the historical theory attributed to Hecataeus

(3), according to which Egyptians, Hellenes and Jews would have

originally inhabited the same land, is ingenious, and must certainly

have been dear to the Ptolemies; but then the former, after having

suffered serious scourges which they attributed to the aversion of

their gods for foreigners, would have expelled the other two

peoples, and so the Hellenes would have gone to Greece, the

Jews, more numerous, to the deserted Judea : in thus a precedent

was set for the subsequent coexistence, especially in Alexandria (4), of the three races.

In Philo's time, as he himself narrates, the number of Jews settled in Egypt (5) was around one million.

thmos from Libya to the borders of Ethiopia."

lione (13 % della popolazione totale): di questi, in Alessandria erano circa 200.000 (i $^{2}/_{5}$ della popolazione).

Nella maggior parte delle città dove gli Ebrei emigravano, essi dapprima ebbero certamente la posizione di pellegrini, non di cittadini: ciò viene indirettamente dimostrato da Giuseppe nel « Contro Apione » (1), poiché egli rileva come cosa strana che gli Ebrei in Alessandria e in altre città godessero del diritto di cittadinanza: si vede dunque che, ai suoi tempi, non era cosa comune il possederla. In seguito, invece, tale diritto fu loro concesso in molte città, soprattutto in quelle nuove, costruite nell' età ellenistica. Nella capitale dei Tolemei, per esempio, Alessandro Magno concesse loro gli stessi diritti dei Macedoni, popolazione privilegiata (2), e i Diadochi li autorizzarono anzi a chiamarsi senz' altro « Macedoni »; in virtù di questi diritti troviamo, presso Alessandria, Ebrei possessori di terre privilegiate e fruenti di molti altri vantaggi, come vedremo in seguito.

Alcuni credono che Tolemeo IV Filopatore avesse introdotto un nuovo diritto di cittadinanza alessandrina, ispirato al culto di Bacco: siccome gli Ebrei non potevano associarsi a questo culto, essi ne sarebbero rimasti esclusi, e avrebbero conservato solamente la loro denominazione anteriore di « Macedoni », la quale però avrebbe perduto il suo primitivo valore (3); ma le ripetute asserzioni di Giuseppe (4), ove si dia loro fede, dimostrerebbero invece che da Alessandro a Vespasiano nulla fu variato nella posizione giuridica degli Ebrei di Alessandria (5).

Infatti Cesare, conquistando l' Egitto, aveva confermato tutti i diritti degli Ebrei, e li aveva fissati anzi su di una stele di bronzo (6); così essi, salvo alcuni episodî isolati,

(4)

Lyon (13% of the total population) : of these, in Alexandria there were approximately 200,000 (i.e. 2/r> of the population).

In most of the cities where the Jews emigrated, they certainly first

had the position of pilgrims, not of citizens: this is indirectly demonstrated by Joseph in "Against Apion"(1), since he notes that it

is strange that the Jews in Alexandria and other cities enjoyed the right

of citizenship: it is therefore clear that, in his time, it was not common

to possess it. Later, however, this right was granted to them in many

cities, especially in the new ones, built in the Hellenistic age. In the

capital of the Ptolemies, for example, Alexander the Great granted

them the same rights as the Macedonians, a privileged population (2),

and the Diadochi actually authorized them to call themselves

"Macedonians"; by virtue of these rights we find, near Alexandria, Jews possessing privileged lands and enjoying many other advantages, as

we will see later.

Some believe that Ptolemy IV Philopator had introduced a new

right of Alexandrian citizenship, inspired by the cult of Bacchus: since

the Jews could not associate with this cult, they would have been

excluded from it, and would have only retained their previous denomination of "Macedonians". », which however would have lost its

original value (3); but the repeated assertions of Josephus (4), if believed, would instead demonstrate that from Alexander to Vespasian nothing changed in the legal position of the Jews of Alexandria (5).

In fact, Caesar, by conquering Egypt, had confirmed all the rights of the Jews, and had even established them upon them. a bronze stele (6) ; so they, except for a few isolated episodes,

17.

lati, continuarono a goderne ancora sotto Augusto, Claudio (1), Vespasiano e altri; perciò Filone (2) aveva a ragione insistito presso Caligola, perché non fosse calpestato da Flacco un diritto riconosciuto agli Ebrei e confermato loro da 400 anni. Molti tuttavia mettono in dubbio tali asserzioni di diritti goduti, o vi oppongono teorie non prive di fondamento, che qui non credo per ora opportuno discutere.

Da Caracalla poi, in virtù della *lex Antoniana de civitate* del 212 d. Cr., la cittadinanza romana spettò indistintamente a tutti gli Ebrei, come facenti parte dell'Impero.

Si trovarono così nella città di Alessandria, in età romana, Ebrei in cinque diverse condizioni:

1) — Ebrei palestinesi, temporaneamente là residenti;
2) — Ebrei persiani (Πέρσαι), forse con funzioni militari;
3) — Ebrei greco-macedoni (3);
4) — Ebrei cittadini alessandrini (Ἀλεξανδρεῖς Ἰουδαῖοι) (4);

(1) FLAV. JOS., *Antiqu.*, 19. 5, 2 § 281.

(2) *In Flacc.*, 44-45.

(3) Interessante il papiro BGU. 1151 (cfr. WILCKEN, *Grundz.*, I, p. 63), del 13 av. Cr., in cui figura un Alessandro di Nicodemo che col fratello Teodoro — e ambedue sono Macedoni —, fa redigere gli atti che lo riguardano davanti all'ἀρχεῖον τῶν Ἰουδαίων (vedi JUSTER, op. cit., II, p. 10, nota); la lettura è però alquanto incerta.

(4) Molto importante, a questo riguardo, è un papiro conservato a Berlino, del 5-4 av. Cr. (BGU. 1140; cfr. *Archiv*, V p. 38 (N. III e n. 2); p. 109 n. 1 e p. 119) che appare corretto proprio nelle parole Ἰουδαίου Ἀλεξανδρέω[ς], alla quale ultima furono sostituite le altre: τῶν ἀπὸ Ἀλεξανδρε[ίας]; è un certo Eleno figlio di Trifone che rivolge al prefetto Gaio Turranio una supplica per venire esentato dalla λαογραφία (vedi più oltre dove parlo dei Censimenti); il documento ha purtroppo delle lacune, ma pare che l'istante si pentisse di dichiararsi, forse contro la verità, *cittadino alessandrino*, e correggesse sul testo « Ebreo Alessandrino », cioè « nato in Alessandria » semplicemente, mentre cittadino veramente era il padre: ἐκ πατρὸς Ἀλεξανδρέ[ως]; non si può certo trarre argomento dalla cancellatura *contro* l'esistenza di un diritto di cittadinanza alessandrina per gli Ebrei, come vogliono lo SCHUBART (*Archiv*, V pp. 109, 119) e il WILCKEN (*Grundz.*, I p. 63; *Chrestom.*, I p. 82); se ne potrebbe dedurre invece che il diritto era *ad personam*, a meno di non ammettere — non so con qual fondamento — con il MOTZO (l. cit.), che anche per il padre si tratti di affermazione falsa; ma perché l'istante non si sarebbe allora pentito anche qui, come prima? Il JUSTER poi (l. cit.) sostiene che

Machine Translated by Google

sides, continued to enjoy it under Augustus, Claudius (1), Vespasian and others ; therefore Philo (2) had rightly insisted to Caligula that a right recognized by the Jews and confirmed to them for 400 years not be trampled upon by Phiacchus.

Many, however, question these assertions of rights enjoyed, or oppose

theories which are not without foundation, which I do not think it appropriate to discuss here for now.

of city

Thus they found themselves in the city of Alexandria, in Roman times, Jews in five different conditions:

1) — Palestinian Jews, temporarily residing there;
2) — Persian Jews ***(ÿÿÿÿÿÿ,ÿ),*** perhaps with military functions;
3) — Greek-Macedonian Jews (3) ;
4) — Jewish citizens of Alexandria ***(ÿÿÿÿÿÿÿÿÿÿ Iwaaioi)*** (4) ;

(1) FLAV. JOS., *Antiq.,* 19, 5, 2 § 281.
I2) *In Flacc.,* 44-45.
(3) The BGU papyrus is interesting. 1151 (see WILCKEN, *Grundz.,* I, p. 63), of 13

av. Cr., in which an Alexander of Nicodemus appears who with his brother Theodore - and both are Macedonians - draws up the doc—um, ents that refer to him

they look before the àp/ÿÿÿÿ ÿÿÿ 'ÿÿÿÿÿÿÿÿ (see JUSTER, op. cit., II, p. 10, note) ; however, the reading is somewhat uncertain.

(4) Very important, in this regard, is a papyrus preserved in Berlin, dated 5-4 BC. Cr. (BGU. 1140; cf. *Archiv,* V p. 38 (ÿ. III and n. 2) ; p. 109 ÿ. 1 and p. 119) which appears correct precisely in the words 'ÿÿÿÿÿÿÿÿÿ ÿ ÿ ÿ ÿ ÿ ÿ ÿ ÿ ÿ ÿ [ÿ], to which the others were replaced: ÿÿ ÿ ÿ ÿ ò 'ÿ ÿÿ ÿ ÿÿÿÿÿÿÿÿ]; it is a certain Helenus, son of Tryphon, who makes a plea to the prefect Gaius Turranius to be exempted from the ÿÿÿÿÿÿÿÿÿ (see below where I talk about the Censuses); too many gaps, but it seems that the applicant regretted declaring himself, perhaps the document has
against the truth, *a citizen of Alexandria,* and corrected the text "Jew of Alexandria", i.e. "born in Alexandria" simply, while the father was truly a citizen: ÿÿ. ÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿ'[ÿÿ] ; one certainly cannot draw an argument from the cancellation *against* the existence of a right of Alexandrian citizenship for the Jews, as SCHUBART *(Archiv,* V pp. 109, 119) and WILCKEN *(Grundz.,* I p. 63; *Chrestom. ,* I p. 82) ; one could instead deduce that the right was *ad personam,* unless one admits - I don't

know on what basis - with MOTZO (1. cit.), that this is also a false statement for the father; but why wouldn't the instant have repented here too, as before? The JUSTER then (1. cit.) maintains that

From Caracalla then, by virtue of the ***lex Antoniana***
of 212 AD. Cr., Roman citizenship was granted to all Jews without distinction, as part of the Empire.

5) — Ebrei contemporaneamente cittadini alessandrini e cittadini romani (come, per es., la famiglia di Tiberio Alessandro).

Forse vi erano anche maggiori disparità di condizioni che obbligavano i gimnasiarchi a tenere apposite liste distinte degli abitanti (1).

Non bisogna poi dimenticare che ogni Ebreo era pure cittadino della Nazione ebraica, per quanto lontano dalla patria, per lo meno prima del 70, cioè prima della caduta di Gerusalemme. Ma anche dopo quella data non troviamo nessun mutamento nelle espressioni usate nel nominarli. Così, per es., in un papir di Ossirinco dell'85 d. Cr. (2) leggiamo: Νικαίᾳ Σιλ[βα]νῷ... πόλεως Ἰουδαίων.

Dai Diadochi venne assegnato agli Ebrei in Alessandria un apposito quartiere, appartato dal rimanente della città, « affinché potessero condurre una vita pura e contemporaneamente mescolarsi meno con gli stranieri », come dice Apione (3).

Questo quartiere (4) era situato nei pressi del palazzo reale, cioè nella parte Nord-Est, vicino alla spiaggia. Più tardi tale divisione non venne strettamente mantenuta, come ci dice Filone (5), poiché esistevano, ai suoi tempi, sinagoghe in ogni parte della città, e molti Ebrei vivevano mischiati col resto della popolazione nei varî quartieri. Inoltre, lo stesso Filone (6) narra che dei cinque quartieri nei quali

erano entrambi cittadini, trovandone conferma nell'educazione ricevuta dal figlio, di cui parla il papiro, e non dà valore alla cancellatura, ritenendo il testo un semplice abbozzo frettoloso.

(1) Mi sono limitato — senza entrare in merito alla vasta discussione, sempre aperta — a pochi accenni sulla condizione giuridica degli Ebrei alessandrini, rimandando all'accurato lavoro del Morzo, col quale però non sempre convengo. Cfr. inoltre Juster, II, pp. 7 e segg.; Schürer, III, pp. 122 e segg., 178.

(2) POxy. 335.

(3) Flav. Jos., *contra Apion.*, 2, 4: qui sembrerebbe che la concessione risalisse ad Alessandro Magno, mentre ciò è chiaramente escluso dal passo del *Bell. Jud.* 2, 18, 7; cfr. Strabo presso Flav. Jos., *Antiqu.*, 14, 7, 2.

(6)

5) — Jews who were simultaneously Alexandrian citizens and Roman citizens (such as, for example, the family of Tiberius Alexander).

Perhaps there were even greater disparities in conditions which forced the gymnasiarchs to keep special distinct lists of inhabitants (1).

We must not forget that every Jew was also a citizen of the Jewish nation, however far from their homeland, at least before 70, that is, before the fall of Jerusalem. But even after that date we find no change in the expressions used in naming them. Thus, for example, in a papyr of Oxyrhynchus from 85 AD. Cr. (2) we read: **ÿÿÿÿÿÿ ÿÿÿ[/3ÿ]ÿÿ... ÿÿ'ÿÿÿ ÿ**

Jews.

From the Diadochi it was assigned to the Jews in Alessan - right to a special neighborhood, set apart from the rest of the city, "so that they could lead a pure life and at the same time mix less with foreigners", as Apion says (3).

This neighborhood (4) was located near the royal palace, that
is, in the north-eastern part, near the beach. Later this division was not strictly maintained, as Philo tells us (5), since in his time there were synagogues in every part of the city, and many Jews lived mixed with the rest of the population in the various neighborhoods. Furthermore, Philo himself (6) narrates that of the five neighborhoods in which

they were both citizens, finding confirmation of this in the education received by their son, of whom the papyrus speaks, and does not give value to the deletion, considering the text a simple hasty sketch.

(1) I have limited myself - without entering into the vast discussion, which is always open - to a few hints on the legal condition of the Alexandrian Jews, referring to the careful work of the ÿÿÿÿÿ, with which however I do not always agree. See also JUSTER, II, pp. 7 and following. ; SCHURER, IH, pp. 122 et seq., 178.

(2) POxy. 335.

(3) FLAV. Jos., *contra Apion.,* 2, 4: here it would seem that the concession dates back to Alexander the Great, while this is clearly excluded from the passage
d e l *Bell. Jud.* 2 , 18, 7 ; cfr . STRABO press o FLAV. Jos. , *Antiqu14,* 7, 2.

(4) Quarter ÿ second FLAV. JOS., *Bell. Judg.,* 2, 18, 8, 6 (5) *In Flacc.,* 8; *Leg. to Caius,* 20
(6) Ibid.

Alessandria era divisa, e che erano denominati con le prime cinque lettere dell'alfabeto greco, due erano detti « quartieri ebraici »: là essi saranno stati in maggioranza; sotto Caligola poi, Flacco emanò una disposizione, in virtù della quale gli Ebrei dovettero ritirarsi in un sol quartiere, il quinto secondo Filone, disposizione che venne peraltro poco dopo revocata da Claudio. Ma ecco che sotto Traiano, a causa delle rivolte giudaiche, il prefetto d'Egitto ordina di nuovo con un editto, che gli Ebrei di Alessandria si stabiliscano in una parte, d'onde non possano assalire facilmente e all'improvviso la città: ma anche tale ordinanza venne poco dopo, sembra, revocata dall'imperatore (1). Infine, nel VI secolo troviamo ancora menzionato nel sermone sulla penitenza, attribuito a S. Cirillo, la « Via degli Ebrei » (2).

Il mantenimento della religione e delle consuetudini ebraiche, anche durante la lontananza dalla Madre patria, e poi durante la dispersione, fu possibile solo mediante l'ordinamento degli Ebrei in Comunità autonome, entro l'ambito delle quali le credenze e le leggi dei padri potevano esser conservate. Ciò avvenne certo fino dalle prime migrazioni, ma più specialmente a partire dall'età ellenistica; e il Motzo (3) scrive giustamente che, anche dove ricevevano la cittadinanza, gli Ebrei « riguardavano come loro centro naturale più il πολίτευμα indipendente, cui erano legati da vincoli etnici e religiosi, che non la πόλις in cui erano cittadini ».

La forma di organizzazione variava a seconda dell'epoca e del luogo, soprattutto in quanto queste comunità ebraiche talvolta avevano il carattere di unioni meramente private, tal'altra erano istituite con diritti politici. Non era tuttavia la Comunità una circoscrizione chiusa in sé, e quindi del tutto indipendente; anzi, all'epoca della dominazione di Roma, le disposizioni relative agli Ebrei da quella emanate sono dirette unicamente alla « Nazione ebraica », e applicabili in ciascuna Comunità simultaneamente. Questa formava così come un piccolo Stato in un altro Stato, e a volte il primo

Alexandria was divided, and which were named with the first five letters of the Greek alphabet, two were called "Jewish quarters": there they must have been in the majority; then under Caligula, Fiacchus issued a provision by virtue of which the Jews had to retreat to a single neighbourhood, the fifth according to Philo, a provision which was however revoked shortly afterwards by Claudius. But behold, under Trajan, due to the Jewish revolts, the prefect of Egypt again orders with an edict that the Jews of Alexandria settle in a part where they cannot easily and suddenly attack the city : but this ordinance was also apparently revoked shortly afterwards by the emperor (1). Finally, in the 6th century we still find the "Way of the Jews" mentioned in the sermon on penance, attributed to St. Cyril (2).

The maintenance of the Jewish religion and customs, even during the distance from the Motherland, and then during the dispersion, was only possible through the organization of the Jews into autonomous communities, within which the beliefs and the laws of the fathers could be preserved. This certainly happened from the first migrations, but more especially from the Hellenistic age; and Motzo (3) rightly writes that, even where they received citizenship, the Jews "regarded as their natural center more the independent ÿÿÿÿÿÿÿÿÿ, to which they were linked by ethnic and religious ties, than the ***ÿÿÿÿÿ*** in which they were citizens".

The form of organization varied depending on the time and place, especially as these Jewish communities sometimes had the character of merely private unions, at other times they were established with political rights. However, the Community was not a closed constituency in itself, and therefore completely independent; indeed, at the time of the domination of Rome, the provisions relating to the Jews issued by it were addressed solely to the "Jewish Nation", and applicable in each Community simultaneously. This thus formed like a small state in another state, and sometimes the first

(1) PPar. 2376 to. **(2) JUST, II p. 328**
(3) Op. cit., p. 18.

aveva diritti maggiori: di modo che in Alessandria gli Ebrei potevano avere una gerusia anche nel tempo in cui la città non ne ebbe per decreto dell'imperatore Augusto (1); del resto, anche prima vi erano i πρεσβύτεροι, citati dal Pseudo Aristea (2), a capo degli Ebrei alessandrini, accanto al genarca nominato da Filone (3), che forse aveva giurisdizione anche sugli Ebrei del restante Egitto, riconosciuto pure dagli imperatori romani, e da identificarsi, pare, con l'ἐθνάρχης citato da Strabone (4): « .... ὃς διοικεῖ τε τὸ ἔθνος καὶ διαιτᾷ κρίσεις καὶ συμβολαίων ἐπιμελεῖται καὶ προσταγμάτων, ὡς ἂν πολιτείας ἄρχων αὐτοτελοῦς ». (« .... colui che governa il popolo, giudica le contese, sovraintende a rapporti contrattuali e cura l'esecuzione delle ordinanze, come l'arconte di una città indipendente »).

Il numero dei componenti la g e r u s i a è incerto, e varia a seconda delle Comunità; per Alessandria, stando alla tradizione ebraica, erano 70: a capo era un gerusiarca, altrimenti detto ἐπιστάτης τῶν παλαίων oppure προστάτης (5): forse egli va identificato con l'archisinagogo, e quindi col Rabbino, che troviamo citato pure per Alessandria (6) e altrove, quale capo religioso della Comunità: ma su questo punto vi sono molte incertezze; viene usato anche il nome di φροντιστὴς (τῆς συναγωγῆς), come da un'iscrizione: Ἡζικία υἱῶ Ἰσα φροντιστὶ Ἀλεξανδρείας (7).

Molto spesso in iscrizioni e in documenti letterarî sono nominati in Egitto gli a r c o n t i, funzionarî scelti tra i componenti la gerusia per l'esecuzione delle deliberazioni; ed è curioso che il titolo di arconte è preso dai funzionarî

it had greater rights : so that in Alexandria the Jews could have a gerusia even in the time in which the city did not have one by decree of the emperor Augustus (1); after all, even before there were the ***ÿÿÿÿÿÿÿÿÿÿ,*** cited by Pseudo Aristeas (2), at the head of the Alexandrian Jews, alongside the genarch appointed by Philo (3), who perhaps also had jurisdiction over the Jews of the remaining Egypt, also recognized by the Roman emperors, and to be identified, it seems, with ***V ÿÿÿÿÿÿÿÿ*** cited by Strabo (4) : « .... ***ÿÿ ÿÿÿÿÿÿÿ*** re ÿÿ ***ÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿ ÿÿÿÿÿÿÿ*** ÿÿÿ ***ÿÿÿÿ ÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿÿÿÿÿ, ÿÿ ÿÿ ÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿÿ »***. (« ·•·. he who governs the people, judges disputes, supervises contractual relationships and takes care of the execution of ordinances, like the

archon of an independent city »).

The number of members of the gerusi a is uncertain, and varies depending on the community; for Alexandria, according to Jewish tradition, there were 70 : at their head was a gerusiarch, otherwise called ***ÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿ*** or ***ÿÿÿÿÿÿÿÿÿ*** (5) : perhaps he should be identified with the archisynagogue, and therefore with the Rabbi, who we also find cited for Alexandria (6) and elsewhere, as religious head of the Community : but on this point there are many uncertainties; the name of ***ÿÿÿÿÿÿÿÿÿ*** (ÿÿÿ ***ÿÿÿÿÿÿÿÿÿ)*** is also used , as per
an inscription : ***ÿÿÿÿÿÿ ÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿÿ 'ÿÿÿÿÿÿÿÿÿ ÿÿÿ*** (7).

Very often in Egypt, inscriptions and literary documents mention the official archonschosenfromamongthemembersofth·egerusiafortheexecutionof resolutions; and it is curious that the title of archon is taken by officials

delle città greche ed è usato anche fuori d'Egitto, in Italia e altrove; con questi debbono essere identificati gli ἡγούμενοι del Pseudo Aristea. Li troviamo nominati per Hermopolis (1), Alessandria (2), Tebe (3), e non vanno confusi, come molti fanno a torto, coi πρεσβύτεροι, né identificati con l'intera gerusia o col gerusiarca; infatti, troviamo che Filone (4) stesso distingue tra gli uni e gli altri, e inoltre in iscrizioni sono nominati insieme come uffici separati e diversi. Né sono da parificarsi ai primati del consiglio, della gerusia, detti (per Alessandria) da Giuseppe (5) οἱ πρωτεύοντες τῆς γερουσίας, e circa quattro secoli dopo da Socrate Scolastico (6) τοὺς τῶν Ἰουδαίων πρωτεύοντες.

Sotto Tolemeo Filadelfo, la Comunità di Alessandria viene denominata dal Pseudo Aristea (7) col nome di πολίτευμα all'ordine di ἡγούμενοι, e Strabone (8) pure fa il paragone con una πολιτεία αὐτοτελής, dal che può dedursi che gli Ebrei potevano legalmente essere assoggettati al pagamento di una tassa per i bisogni della Comunità stessa.

Come in Alessandria, troviamo nominate Comunità ebraiche in altri centri di Egitto; così in Athribis, dove sotto Tolemeo V Epifane si formò una colonia (9) ebraica detta semplicemente οἱ Ἰουδαῖοι, come rilevasi da un'iscrizione del 200-100 av. Cr. (10); e con la stessa denominazione venivano indicate quella di Schedia presso Alessandria (iscrizione del 246-221 av. Cr.) (11) e di Xenephyris (12).

Ebrei si trovavano, non sappiamo se numerosi, in un villaggio dei Siri, come rilevasi dalle parole .... ἀπὸ Σύρων κώμης di un papiro del 59 d. Cr. (PHamb. 2). Già in un papiro dell'Arsinoite del 27° anno di Tolemeo II (259-58 av. Cr.) è nominata una Σύρων κώμη (1) che può forse indicare « villaggio degli Ebrei » (sebbene la loro denominazione usuale fosse quella di Ἰουδαῖοι), poiché in papiri aramaici gli Ebrei sono detti « Aramei », che equivale a « Siri »; e così in un papiro del III sec. av. Cr., Συριστί vuol probabilmente dire « in lingua ebraica » (2). Del resto spesso, come in un papiro del 238 av. Cr. (3). gli Ebrei erano detti *Siriaci,* o *Siriaci di Palestina.*

Col nome di κατοικία (4) viene indicato l'insieme degli Ebrei di Leontopolis.

Una Comunità ebraica assai importante troviamo nel periodo romano a Ossirinco, (nella parte orientale del Nilo), con un quartiere ebraico, come rileviamo da due papiri dell'85 (POxy. 335) e del 133 d. Cr. (POxy. 100), dove ricorrono le parole « ἐπ' ἀμφόδου Ἰουδαικοῦ » nel primo, ed « ἐπ' ἀμφόδου.... Ἰουδαικῆς » nel secondo (5). Ostili agli Ebrei erano gli altri abitanti di Ossirinco; infatti, in un papiro del 200-202 d. Cr. (6) si rileva da una supplica di un certo Orion agli imperatori Settimio Severo e Caracalla, che nella guerra con gli Ebrei (probabilmente quella del tempo di Traiano, estesasi anche nel Medio e Alto Egitto) (7), essi avevano prestato man forte (συμμαχία), e festeggiavano ogni anno l'anniversario della vittoria.

Ad Antinoe (Antinopolis), fondata nel Medio Egitto

(10)

Jews were found, we do not know if numerous, in a village or among the Syrians as can b e seen from the words .... ÿÿÿ ***ÿÿÿÿÿ ÿÿÿÿÿ*** of a papyrus from 59 AD. Cr. (PHamb. 2). Already in a papyrus of the A rsi ÿ ÿ ite of the 27th year of Ptolemy II (259-58
BC) a ***ÿÿÿÿÿ ÿÿÿÿ*** (1) is mentioned which can perhaps indicate "village of the Jews" (although their usual name was that of ***ÿÿÿÿÿÿÿÿ),*** since in Aramaic papyri the Jews are called "Arameans", which is equivalent to "Syrians "; and so in a papyrus from the 3rd century. av. Cr., ***ÿÿÿÿÿÿÿ*** probably means "in the Hebrew language" (2). Moreover, often, as in a papyrus from 238 BC. Cr. (3), the

Jews were called *Syriacs,* or *Syriacs of Palestine.*

The name ÿÿÿÿÿÿÿÿ (4) indicates the set of Jews of Leontopolis.

We find a very important Jewish community in the Roman period in Oxyrhynchus, (in the eastern part of the Nile), with a Jewish quarter, as we note from two papyri from 85 (POxy. 335) and 133 AD. Cr. (POxy. 100), where the words « ÿÿ' ***ÿÿÿÿÿÿÿ*** 'ÿÿÿÿÿÿÿÿÿ » occur in the first, and « in' ***ÿÿÿÿÿÿÿ.... ÿÿÿÿÿÿÿÿÿ*** » in the second (5). The other inhabitants of Oxyrhynchus were hostile to the Jews; in fact, in a papyrus from 200-202 AD. Cr. (6)

we note from a supplication by a certain Orion to the emperors Septimius Severus and Caracalla, that in the war with the Jews (probably that of the time of Trajan, which also extended to Middle and Upper Egypt) (7), they had lent a strong hand (ÿÿÿÿÿÿÿÿ), and celebrated the anniversary of the victory every year.

Ad A ÿ ti ÿ ÿ e (Antinopolis), founded in Middle Egypt

(1) PTbt. 402. There were two other places so named: in the Alexandrian territory (BQU. 1123 and 1132) and in Oxyrhynchite. (See AGREEMENTS, in *Studi Scuola Papirol. Milano,* III p. 26).

(2) PPetrie II p. 23; IIi pp. 161-62 (where it is a better read). (3)PTebt. 907.

da Adriano nel 122, gli Ebrei andarono contemporaneamente ai Greci, attrattivi dal commercio col porto di Myso Hormus sul Mar Rosso (1).

A Magdola, essendo nominata in un papiro del 217 av. Cr. (2) una προσευχὴ τῶν Ἰουδαίων, doveva esistere una Comunità di Ebrei, e non esservi solamente Ebrei isolati (3). Lo stesso nome Μάγδωλα è semitico (מגדול), ma trovasi spesso in Egitto (4). Un *Migdol* presso Pelusium trovasi menzionato nel Vecchio Testamento (5).

A Memfi doveva esistere una importante Comunità ebraica, poichè sembra che gli Ebrei occupassero tutto un quartiere, come fa supporre anche la vicinanza del tempio di Onias (6).

Gli Ebrei di Cinopoli sono menzionati in un papiro del 117 d. Cr. (7) a proposito, sembra, della confisca dei loro beni da parte di uno stratega dell'Eracleopolite, avvenuta in quell'anno, in seguito alla ribellione del 115.

In una lista d'imposte pagate da Ebrei, si fa una distinzione molto netta fra Ebrei e non Ebrei di Arsinoe, per cui è probabile che essi formassero una vera Comunità costituita.

Dovevano essere numerosi gli Ebrei a Tebe, considerato che in una città (forse Hermopolis) del Medio Egitto, appunto gli Ebrei di Tebe avevano una Sinagoga propria, come rilevasi da un papiro del 113 d. Cr. (8).

Da alcuni documenti si apprende che gli Ebrei in Apollinopolis Magna (9) abitavano il quarto quartiere: curiosa coincidenza con quanto avveniva — secondo Giuseppe Flavio (10) — in Alessandria.

Durante il nostro studio, avremo occasione di nominare altre località abitate da Ebrei, ma non sappiamo con preci-

by Hadrian in 122, the Jews went at the same time as the Greeks, attracted by trade with the port of Myso Hormus on the Red Sea (1).

In Magdola, being mentioned in a papyrus of 217 BC. Cr. (2) a ***ÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿ,*** there had to be a community of Jews, and not just isolated Jews (3).
The name ***ÿÿÿÿÿÿÿ*** itself is Semitic (SnjQ),

found in Egypt (4). A *Migdol* near Pelusium is mentioned in the Old Testament (5).

An important Jewish community must have existed in Memphi, since it seems that the Jews occupied an entire neighborhood, as the proximity of the temple of Onias suggests (6).

The Jews of C i ÿ ÿ ÿ ÿ 1 i are mentioned in a papyrus of 117 AD. Cr. (7) regarding, it seems, the confiscation of their assets by a Heracleopolite strategist, which occurred in that year, following the rebellion of 115.

In a list of taxes paid by Jews, a very clear distinction is made between Jews and non-Jews of A rsi ÿ ÿ e, so it is probable that they formed a truly established community.

TheremusthavebeennumerousJewsinThebesconsidering that in a city (perhaps Hermopolis) in Middle Egypt, the Jews of Thebes had their own synagogue, as revealed by a papyrus dated 113 AD. Cr. (8).

From some documents we learn that the Jews in A ÿ ÿ 1- linopoli s Magn a (9) inhabited the fourth neighborhood: a curious coincidence with what happened - according to Josephus (10) - in Alexandria.

During our study, we will have the opportunity to name other places inhabited by Jews, but we do not know precisely

sione se in esse esisteva una Comunità, né abbiamo notizie del primo arrivo di Ebrei sul posto, dei quartieri loro assegnati, ecc.; in generale può valere il passo di Strabone (1): « in Egitto l'abitazione degli Ebrei è riservata a parte ».

***

Il continuo contatto con la cultura pagana non poteva non influire sull'interno sviluppo dell'Ebraismo nella Diaspora; dove poi gli Ebrei, per la loro posizione sociale, erano in condizione di appropriarsi i mezzi di cultura dei proprî tempi, come in Alessandria, l'Ebraismo prese un indirizzo che era essenzialmente diverso dall'Ebraismo palestinese: l'Ebreo colto della Diaspora non era soltanto ebreo, ma anche greco, possedendo dei Greci la cultura, la lingua, molti costumi; ed era portato, dalla forza delle circostanze, a cercare una conciliazione fra l'essenza ebraica e la ellenica. Ma il fondamento ebraico mantenne sempre una parte preponderante.

Uno dei mezzi principali per conservare la fede dei Padri negli Ebrei della Diaspora, erano le regolari riunioni nelle Sinagoghe: queste si trovavano dovunque una comunità era organizzata. In quasi tutte le fonti, e specialmente nei papiri degli ultimi secoli av. Cr., le sinagoghe in Egitto sono chiamate col nome greco di προσευχή « luogo di preghiera » (traduzione dell'ebraico בית התפלה) o di εὐχεῖον (2).

Per quanto si riferisce alla costruzione e alla manutenzione delle sinagoghe e ai terreni adiacenti in possesso delle Comunità, abbiamo alcune notizie che riassumo: numerose erano le sinagoghe di Alessandria; se ne ricorda una già nel III sec. av. Cr. (3); una iscrizione del 143 o 116 av. Cr. si riferisce forse alla ricostruzione di una sinagoga, distrutta da un terremoto, a spese di un ricco Ebreo (4); un'altra iscrizione, che secondo lo Strack (5) si riferisce al

(12)

sion if a community existed in them, nor do we have any news of the first arrival of Jews on the site, of the neighborhoods assigned to them, etc. ; in general the passage from Strabo (i) can be valid: «in Egypt the housing of the Jews is reserved separately».

The continuous contact with pagan culture could not fail to influence the internal development of Judaism in the Diaspora;
where then the Jews, due to their social position, were in a position
to appropriate the means of culture of their times, as in Alexandria, Judaism took a direction that was essentially different from Palestinian Judaism: the cultured Jew of the Diaspora was not only Jewish, but also Greek, possessing the culture, language and many customs of the Greeks; and he was led, by the force of circumstances, to seek a

conciliation between the Jewish essence and the Hellenic one. But the Jewish foundation always maintained a predominant role.

One of the main means of preserving the faith of the Fathers in the Jews of the Diaspora was the regular meetings in the Synagogues: these were found wherever a community was organised. In almost
all sources, and especially in the papyri of the last centuries BC. Cr., the synagogues in Egypt are called by the Greek name of *ÿÿÿÿÿÿÿÿ* "place of prayer" (translation of the Hebrew nSsrì H TV2)

0

di ***wisheon*** (2).
As regards the construction and maintenance of the synagogues and the adjacent land in the possession of the Communities, we have

some information which I will summarize: there were numerous synagogues in Alexandria; one is remembered as early as the 3rd century. av. Cr. (3); an inscription from 143 or 116 av. Cr. it perhaps refers to the reconstruction of a synagogue, destroyed by an earthquake, at the expense of a rich Jew (4); another inscription, which according to Strack (5) refers to

(5) *Archive* II p. 559

37 o 36 av. Cr., ci rende noto come ad Alessandria una sinagoga sia stata costruita al tempo di Cleopatra VII e di Tolemeo XVI, a spese di un munifico benefattore: [ὑπὲρ] βασ[ιλίσσης]ς καὶ β[ασιλ]έως θεῶι [με]γάλωι ἐ[πηκό]ωι Ἄλυπ[ος τὴν] προσε[υχὴν] ἐπόει ιε Με[χεὶρ...] (1).

Sotto Caligola, come sappiamo da Filone (2), furono incendiate e distrutte delle sinagoghe. Ma se questo delitto non venne preveduto dalla legge e quindi punito nel periodo pagano, fu invece contemplato dopo l'estendersi del Cristianesimo; il che non impedì che nel 414, quando Cirillo espulse da Alessandria gli Ebrei, egli facesse occupare i templi e li trasformasse in chiese cristiane, dando a una di esse il nome di S. Giorgio, come narra la cronaca etiopica di Giovanni Madabbar, vescovo di Nikiu (3).

La sinagoga principale di Alessandria era un vero capolavoro di edilizia greca, a forma di basilica, con doppia fila di colonne, immensa. Interessante quanto è detto nel trattato ebraico del *Talmud* (4): era tale la vastità, che la voce dell'officiante non giungeva da per tutto, per cui nel centro era un rialzo di legno, sul quale stava un incaricato con una bandiera in mano, per dare il segnale ai fedeli riuniti, quando dovevano rispondere « Amen ». Ogni maestranza aveva il proprio recinto, cosicché era facile agli stranieri trovar subito i proprî compagni in arte; una parte apposita era riservata ai membri dell'alto consiglio, con sedili di grande valore.

Sono particolarmente degne di rilievo le notizie riflettenti il tempio di Onias a Leontopolis: al tempo di Antioco V Eupatore (164-62 av. Cr.) (5), il figlio del Sommo Saserdote di Gerusalemme, Onias IV (6), visto che non aveva

37 o 36 av. Cr., ***ci*** rende noto come ad Alessandria una si-nagoga sia stata buitti al tempo di Cleopatra VII e di Tolemeo XVI, a spese di un munifico **benefattore : *-eoi* [fxsJya'Xwi *e[piih.o]oi*** "Alyp[ss ***tyiv] ttroae[hygyn\ poei ie Me[heir..] (1).***

Under Caligula, as we know from Philo (2), synagogues were set on fire and destroyed. But if this crime was not foreseen by the law and therefore punished in the pagan period, it was instead contemplated after the spread of Christianity; which did not prevent that in 414, when Cyril expelled the Jews from Alexandria, he had the temples occupied and transformed them into Christian churches, giving one of them the name of St. George, as narrated in the Ethiopian chronicle of Giovanni Madabbar, bishop by Nikiu (3).

The main synagogue of Alexandria was a true masterpiece of Greek construction, in the shape of a basilica, with a double row of columns, immense. What is said in the Jewish treatise of the *Talmud* (4) is interesting: the vastness was such that the voice of the officiant did not reach everywhere, so in the center there was a wooden rise, on which stood an official with a flag in hand, to give the signal to the assembled faithful when they had to respond "Amen". Each worker had his own enclosure, so that it was easy for foreigners to immediately find their companions in the art; a special part was reserved for members of the high council, with seats of great value.

The information reflecting the times of Onias sa Leontopolis is particularly noteworthy: at the time of Antiochus V Eupator (164-62 BC) (5), the son of the High Priest of Jerusalem, Onias IV (6), since he didn't have

Priest Onias III who went to Egypt (FLAV. Jos., *Bell. Jud.,* 1 .

alcuna probabilità di ottenere il sommo pontificato in Palestina, era andato in Egitto ed era stato benevolmente accolto da Tolemeo VI Filometore e da sua moglie Cleopatra. Il re gli cedette in Leontopolis, nel nômo di Heliopolis, un antico tempio diroccato, che prima era un santuario della ἀγρία Βούβαστις, e gli cedette pure delle terre per sovvenire ai bisogni del culto (1). Di questo fece Onias un tempio ebraico sul tipo di quello di Gerusalemme, con alcune modificazioni e più piccolo; ed essendo stati trovati facilmente i sacerdoti, fu stabilito (circa nel 160 av. Cr.) un servizio religioso che ininterrottamente funzionò sino a quando il tempio fu chiuso, all'epoca della caduta di Gerusalemme (73 d. Cr.), da Vespasiano, che, malgrado la sua tolleranza verso gli Ebrei, temette troppa centralizzazione (2): deve perciò ritenersi un atto politico.

Giuseppe Flavio più volte indica il tempio di Onias, localizzandolo in Leontopolis nel nômo di Heliopolis (e non in quello di Leontopolis, molto più a settentrione, distante circa 24 mila passi da Memfi, ad oriente del Delta); altre volte lo situa nella ἡ Ὀνίου λεγομένη χώρα (3), tra Pelusio e Memfi, identificabile forse col *Castra Judaeorum* (nella provincia Augustamnica) della *Notitia Dignitatum Orientis* (4), all'oriente del Delta. Infatti, proprio in tale luogo è situata la città araba moderna di Tell el-Jehudieh (il cui nome corrisponde ai precedenti), dove appunto sono stati trovati avanzi del famoso tempio, e una necropoli ritenuta del I sec. d. Cr., nella quale esistono molte iscrizioni col nome di Onias (5), evidentemente assai usato tutto all'intorno. Da un altro passo di Giuseppe (6) si apprende anche che il tempio di Onias fu gratificato con proprietà fondiarie.

(14)

no chance of obtaining the supreme pontificate in Palestine, he
had gone to Egypt and had been kindly welcomed by Ptolemy VI Philometor and his wife Cleopatra. The king gave him in Leontopolis, in the nómo of Heliopolis, an ancient ruined temple, which was previously a sanctuary of the ***ÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿ,*** and also gave him

some lands to meet the needs of the cult (1). From this Onias made a Jewish temple similar to that of Jerusalem, with some modifications and smaller ; and the priests having been easily found, a religious service was established (around 160 BC) which functioned uninterruptedly until the temple was closed, at the time of the fall of Jerusalem (73 AD), by Ve -Spasian, who, despite his tolerance towards the Jews, feared too much centralization (2): it must therefore be considered a political act.

Josephus Flavius several times indicates the temple of Onias, locating it in Leontopolis in the nomo of Heliopolis (and not in that
of Leontopolis, much further north, about 24 thousand steps away from Memphis, east of the Delta) ; other times he places it in the ***r, ÿÿÿÿ ÿ ÿÿÿÿÿÿÿÿ ÿÿÿÿ*** (3), between Pelusium and Memphis, perhaps identifiable with the *Castra Judaeorum* (in the Augustamnica province) of the *Notitia Dignitatum Orientis* (4), to the east of the Delta. In fact, the modern Arab city of Teli el-Jehudieh (whose
name corresponds to the previous ones) is located precisely in
this place, where remains of the famous temple were found, and a necropolis believed to date back to the 1st century. d. Cr., in which there are many inscriptions with the name of Onias (5), evidently widely used all around. From another passage of Josephus (6) we also learn that the temple of Onias was rewarded with landed properties.

Da due interessanti frammenti di iscrizioni su marmo bianco del II sec. av. Cr., riferentisi, pare, a Tolemeo IV Filometore, uno dei sovrani più favorevoli agli Ebrei, apprendiamo che il tempio di Athribis fu costruito a spese di un benefattore, aiutato in questa sua munificenza dalla Comunità intera:

« In onore del re Tolemeo e della regina Cleopatra, Tolemeo figlio di Epicide sorvegliante delle guardie e gli Ebrei di Athribis [consacrarono] la sinagoga al Dio Altissimo ».

« In onore del re Tolemeo e della regina Cleopatra e dei figli, Hermias e (sua) moglie Filotera e i (loro) figli questa esedra [donarono] alla sinagoga ».

(*ὑπὲρ βασιλέως Πτολεμαίου καὶ βασιλίσσης Κλεοπάτρας Πτολεμαῖος Ἐπικύδου ὁ ἐπιστάτης τῶν φυλακιτῶν καὶ οἱ ἐν Ἀθρίβει Ἰουδαῖοι τὴν προσευχὴν Θεῷ Ὑψίστῳ.*

ὑπὲρ βασιλέως Πτολεμαίου καὶ βασιλίσσης Κλεοπάτρας καὶ τῶν τέκνων Ἑρμίας καὶ Φιλ[ω]τέρα ἡ γυνὴ καὶ τὰ παιδία τήνδε ἐξέδραν τὴ[ι] προσευχῆ[ι]) (1).

In un papiro di Magdola, che sembra del 217 av. Cr. (2), è una supplica al re, dove è menzionata la *προσευχὴ τῶν Ἰουδαίων*, presso il cui custode era stato deposto un mantello da una donna (3), alla quale esso era stato rubato.

Per la sinagoga di Schedia abbiamo la seguente iscrizione riferentesi a Tolemeo III Evergete (243-221 av. Cr.):

« In onore del re Tolemeo e della regina Berenice sorella e moglie e dei figli, gli Ebrei [dedicarono *o* costruirono] la sinagoga ».

(*ὑπὲρ βασιλέως Πτολεμαίου καὶ βασιλίσσης Βερενίκης ἀδελφῆς καὶ γυναικὸς καὶ τῶν τέκνων τὴν προσευχὴν οἱ Ἰουδαῖοι*) (4).

Da un papiro del 113 d. Cr. apprendiamo che gli arconti

Machine Translated by Google

From two interesting fragments of inscriptions on white marble

from the 2nd century. av. Cr., referring, it seems, to Ptolemy IV

Philometor, one of the sovereigns most favorable to the Jews, we

learn that the temple of Athribi was built at the expense of a

benefactor, aided in this munificence by the entire community: «In honor of King

Ptolemy and Queen Cleopatra, Ptolemy son of Epicides overseer of the guards and the Jews of Athribis [consecrated] the synagogue to the Most High God."

"In honor of King Ptolemy and Queen Cleopatra and their children, Hermias and (his) wife Philotaera and (their) children [donated] this exedra to the synagogue."

***(over King* Ptolemy *and Queen Cleopatra* Ptole -**
maios Epikyiou *6 overseer of the Ilakites and those in AB·rivei the prayer ,* God *Most High.*

Jews

in favor of King Ptolemy and Queen Cleopatra and others
***children of Hermia* and Philothe'^a *the woman* and *the children did not exedra* r>5[t] *prayer[i])* (1)·**

In a papyrus of ÿ agd ÿ 1 a, which appears to date from 217 BC. Cr. (2), is a supplication to the king, where the ***ÿÿÿÿÿÿÿÿ*** ÿÿÿ

ÿÿÿÿÿÿÿÿ is mentioned, with whose guardian a cloak had been placed by a woman (3), from whom it had been stolen.

For the synagogue of Schedi a we have the following inscription: tion referring to Ptolemy III Evergetes (243-221 av. Cr.):

"In honor of King Ptolemy and Queen Berenice, his sister and wife, and their children, the Jews [dedicated or built] the synagogue."

(for King* Ptolemy and *Queen Berenice Adelg/ is and
wife and children the prayer of the Jews) (4).

From a papyrus dated 113 AD. Cr. we learn that the archons

(1) *Rev. One. Juiv.* 17 (1888) pp. 235-38 = *Bull. Corr. Hell.* 13 (1889), pp. 100-1 178-182 = DITTENBERGER, *Or. Gr. Inscr. Sei.* Nos. 96 and

(2) PLille II 35; cf. SCHURER, III p. 45.
(3) It appears that the woman was not Jewish; see *Archive* IV p. 54.
(4) *Bull. Soc. Arch. Alex.* 4 (1902) p. 49 = *Rev. It is. Jewish* 45 (1902) p. 162 =

Ebrei di una *προσευχὴ Θηβαίων* (forse di Ebrei venuti da Tebe), devono pagare una tassa per un *εὐχεῖον*, sembra a Hermopolis (1).

Un papiro della fine del II sec. av. Cr. (2) ci dice che a Tebtynis la sinagoga possedeva un giardino sacro (*ἱερὰ παράδεισος*); e poichè *ἱερός* in Egitto è costantemente usato per indicare cose appartenenti al culto divino, è da ritenersi che il giardino di cui si tratta facesse parte del tempio; probabilmente però il terreno era stato semplicemente dato in affitto alla Comunità, e non le apparteneva.

Un particolare architettonico interessante ci dà un'iscrizione per il tempio di Xenephyris (3): « In onore del re Tolemeo, della regina Cleopatra sua sorella e della regina Cleopatra sua nipote, gli Ebrei di Xenephyris [costruirono] il vestibolo (*o* portico) della sinagoga, essendo alla direzione [dei lavori] (*o forse:* capi della comunità) Teodoro e Achillione ». (*ὑπὲρ βασιλέως Πτολεμαίου καὶ βασιλίσσης Κλεοπάτρας τῆς ἀδελφῆς καὶ βασιλίσσης Κλεοπάτρας τῆς γυναικὸς οἱ ἀπὸ Ξενεφύρεος Ἰουδαῖοι τὸν πυλῶνα τῆς προσευχῆς προστάντων Θεοδώρου καὶ Ἀχιλλίωνος*).

Sembra che alcune sinagoghe abbiano esercitato il diritto di asilo, come i templi pagani. Infatti, apprendiamo da un'iscrizione greco-latina (4) trovata nel Basso Egitto, che la regina e il re (secondo il Mommsen (5), Zenobia e Vaballathus) ordinarono di rinnovare un'antica iscrizione, il cui contenuto era che il re Tolemeo Evergete e sua moglie dichiaravano la sinagoga inviolabile, cioè garantita come asilo; si tratterà probabilmente di Tolemeo III piuttosto che

».

del VII (che pure chiamavasi Evergete), essendo stato egli più favorevole agli Ebrei, tanto più che al suo tempo vigeva l'uso di ricordare assai frequentemente accanto al re anche la regina.

Il rispetto e la devozione dovuti da ogni persona verso l'autorità sovrana del luogo, erano stilizzati in formule dalle quali era, generalmente, proibito l'allontanarsi; ma per gli Ebrei si ammettevano quelle restrizioni ed esenzioni da codeste formule d'ossequio necessarie ad evitare che cadessero, sia pure materialmente pronunziandole, in un peccato d'idolatria; questo già sotto i Tolemei, come ci dimostrano le iscrizioni riflettenti gli Ebrei di Athribis, di Schedia, ecc. (1), dove i re d'Egitto sono nominati senza gli attributi divini loro usualmente dovuti. Del resto, gli ordini reali non avevano forza di legge presso gli Ebrei, se non conciliati con la *Thorà,* mediante l'interpretazione dell'etnarca (2). E a proposito del giuramento di fedeltà al sovrano, narra Giuseppe che davanti a Tolemeo Filometore, Ebrei e Samaritani di Alessandria giuravano per il loro Dio e per il Re (3).

Quando gli Ebrei, per effetto dell'occupazione romana dell'Egitto, passarono a dover sottostare alle loro leggi, si trovavano già in possesso di determinati diritti e di concessioni, di cui i Romani tennero conto: così successivamente vennero emanati decreti atti a garantirne la libertà di culto e la posizione giuridica.

Vediamo, pertanto, che gli Ebrei sono i primi a invocare la protezione romana, anche dove vigevano già per loro sufficienti garanzie di libertà, come ad Alessandria, e questo anzi forse spiega, in parte, l'odio manifestato allora dagli Alessandrini contro di essi. È naturale, del resto, che gli Ebrei tenessero a farsi confermare dalla superiore autorità i diritti già loro accordati dai precedenti dominatori, derivandone maggiori garanzie di quanto non sarebbe avvenuto in seguito a concessioni semplicemente emanate o confermate dalle autorità locali: infatti, le leggi romane solevano

of the VII (who was also called Evergete), having been more favorable to the Jews, especially since in his time there was the custom of remembering the queen very frequently alongside the king.

The respect and devotion owed by each person towards the sovereign authority of the place were stylized in formulas from which it was generally forbidden to deviate; but for the Jews those restrictions and exemptions from these formulas and respects were admitted or necessary to prevent them from falling, even if they were materially pronounced, into a sin of idolatry; this already under the Ptolemies, as shown by the inscriptions reflecting the Jews of Athribis, Schedia, etc. (1), where the kings of Egypt are appointed without the divine attributes usually due to them. Moreover, the royal orders did not have the force of law among the Jews, unless reconciled with the *Torah,* through the interpretation of the ethnarch (2).

And regarding the oath of loyalty to the sovereign, Josephus narrates that before Ptolemy Philometor, the Jews and Samaritans of Alexandria swore by their God and by the King (3).

When the Jews, as a result of the Roman occupation of Egypt, began to have to submit to their laws, they already found themselves in possession of certain rights and concessions, which the Romans took into account: so subsequently decrees were issued to guarantee their freedom of worship and legal position.

We see, therefore, that the Jews are the first to invoke Roman protection, even where sufficient guarantees of freedom already existed for them, as in Alexandria, and this perhaps explains, in part, the hatred then manifested by the Alexandrians against of es^i. It is natural, moreover, that the Jews wanted to have the rights already granted to them by the previous dominators confirmed by the superior authority, deriving greater guarantees than would have happened following concessions simply issued or confirmed by the local authorities: in fact , the Roman laws used

to

generalmente rivestire carattere di perpetuità, anche quando erano a conferma di privilegi locali, come ad Alessandria. D'altra parte, come tutti i sottoposti all'impero romano, anche gli Ebrei erano tenuti al culto imperiale: troviamo però in questo tempo usate sempre, a designare un tale culto, le espressioni Σωτήρ, Εὐεργέτης, κύριος, χάρις, φιλανθρωπία, ecc., che non implicavano un significato vero e proprio di divinità; ma in un papiro del Fayum del 101 d. Cr. (BGU. 1068 $_{20}$) abbiamo frammentario il giuramento di un Ebreo per avvalorare una dichiarazione di morte, in questi termini: « ὀμνύω Αὐτοκράτορα Καίσα[ρα Νέρουα] Τραιαν[όν] σεβαστόν... ».

Un editto del prefetto d'Egitto che ordina agli Ebrei di far preghiere nelle sinagoghe in favore dell'imperatore, conservatoci in un papiro (BGU. 646), mostra come tale uso generale fosse osservato anche là, per implorare da Dio la grazia sul sovrano (1).

Molto esteso era ai tempi dei Tolemei l'uso di dedicare le sinagoghe ai sovrani, come forma di devozione e di sottomissione. Abbiamo i frammenti citati di Schedia e di Athribis (2); ad Alessandria, nel cimitero Chugafa, è stata scoperta una dedica ad una regina (3), e un'altra a Tolemeo III e a Berenice fu trovata, come si è veduto, nel canale tra Alessandria e il ramo canopico del Delta (4); a Xenephyris è stata recentemente scoperta l'iscrizione, pure già citata in parte (5), posta nel vestibolo della sinagoga, contenente una dedica a Tolemeo VII Evergete II Fiscone, alla regina Cleopatra sua sorella, e alla regina Cleopatra sua nipote, che egli sposò nel 143 av. Cr., senza ripudiare la prima moglie sposata due anni prima: è quindi databile fra il 143 e il 116 av. Cr. (6).

Altra forma con la quale si onoravano i sovrani e si ringraziavano per la protezione accordata, erano le deliberazioni delle Comunità di redigere decreti, ψηφίσματα « mozioni »,

generally have a perpetual nature, even when they confirmed local privileges, as
in Alexandria.
On the other hand, like all subordinates to the Roman Empire, Jews were also held at the imperial cult : however, we always find used, to designate such a cult in this time, the expressions ***ÿÿÿÿÿ, ÿÿÿÿÿÿÿÿÿ, ÿÿÿÿÿÿ, ÿÿÿÿÿ, ÿÿÿÿÿÿÿÿÿÿÿ,*** which they did not imply a real meaning of divinity; but in a Fayum papyrus etc., from 101 AD. Cr. (BGU. 1068 20) we have fragmented the oath of a Jew to corroborate a declaration of death, in these terms : ÿ ***ÿÿ ÿ ...***

».

An edict of the prefect of Egypt ordering the Jews to pray in the synagogue in favor of the emperor, preserved in a papyrus (BGU. 646), shows how this general custom was observed there too, to implore from God's grace upon the sovereign (1).

The use of dedications was very widespread in the times of the Ptolemies -

as a form of de- and submission. We have the cited fragments of Schedia and Athribis (2); in

Alexandria, in the Chu-gafa cemetery, a dedication to a queen was discovered (3), and another to Ptolemy III and Berenice was found, as we have seen, in the canal between Alexandria and the canopic branch of the Delta (4) ; in married in 143 av. Cr., without repudiating his first wife married two years earlier : it can therefore be dated between 143 and 116 BC. Cr. (6).

Another form with which the sovereigns were honored and thanked for the protection granted was the deliberations of the Communities to draw up decrees, ***ÿÿÿÿÿÿÿÿÿ*** "motions",

(1) See JUSTER, I p. 346 no. 3 and p. 347 no. 4 and 6.

(6) This use was extended to other parts of the Empire.

cared for the synagogue and the sovereigns vocation .

contenenti atti di grazie e di lodi, che spesso venivano realmente pronunziati in forma solenne (1) e a volte anche sunteggiati in iscrizioni poste a perpetua memoria nei templi. Così, ad Alessandria in onore di Caligola (2) e di altri (3); a Leontopolis per un generale ebreo (fine del II sec. av. Cr. (4); l'iscrizione principia: [ἐπειδὴ... Ὀνίας] Χελκίου στ[ρατηγὸς πολλὴν πρόνοιαν ποιεῖται ὑπὲρ τοῦ πλή]θους τῶν ἐν τῶι τεμέ[νει...]).

Filone (5) ci narra però del culto molto liberale degli Ebrei alessandrini, che sebbene non ammettessero nei templi le immagini del culto imperiale, pure vi appendevano corone, scudi, vi ergevano stele e affiggevano iscrizioni, tutti segni ed emblemi relativi a tale culto; quando però sotto Caligola, tanto geloso degli onori a lui dovuti, per istigazione del prefetto, e lui consenziente, i Greci alessandrini nel 38 trasportarono nelle sinagoghe statue imperiali, gli Ebrei si opposero energicamente, tanto che ne nacquero gravi tumulti; ad essi si riferiscono gli atti di Isidoro e di Lampone relativi a un processo svoltosi dinanzi a Claudio contro di loro, quali fautori di tali moti, e terminato con la loro condanna a morte (6).

Curiosa è poi una iscrizione del Fayum dell'epoca di Augusto (7), che contiene l'invocazione al Θεῶι μεγάλω⟨ι⟩ μεγάλω⟨ι⟩, espressione propriamente egiziana, alla quale segue la parola ὑψίστω⟨ι⟩, generalmente usata dagli Ebrei per designar Dio.

containing acts of grace and praise which were often actually pronounced in a solemn form (1) and sometimes also summarized in inscriptions placed in perpetual memory in the temples. Thus, in Alexandria in honor of Caligula (2) and others (3) ; in Leontopolis for a Jewish general (end of the 2nd century BC Cr. (4); the inscription Principia: [ÿÿÿÿ^... ÿÿÿÿÿ] ÿÿÿÿÿÿÿ

director* of many *welfares it is done in* addition to the majority of *them wait[nei...]).

However, Philo (5) tells us of the very liberal cult of the Alexandrian Jews, who although they did not allow the images of the imperial cult into the temples, still hung crowns, shields, erected steles and posted inscriptions, all signs and emblems relating to this cult; However, when under Caligula, so jealous of the honors due to him, at the instigation of the prefect, and with his consent, the Alexandrian Greeks transported imperial statues into the synagogues in 38, the Jews opposed them energetically, so much so that serious riots arose ; the acts of Isidoro and Lampone relating to a trial which took place before Claudio against them, as supporters of these movements, and ended with their death sentence refer to them (6).

Then there is a curious inscription from the Fayum from the time of Augustus (7), which contains the invocation to ÿÿÿÿ ***ÿÿÿÿÿÿÿÿÿ) ÿÿ-*** yaX«(t), a properly Egyptian expression, which is followed by the word ***ÿÿÿÿÿÿ(ÿ),*** generally used by Jews to design God.

(7) *Archiv* V p. 163 n. 10

Anche le norme per le offerte al Tempio e per i pellegrinaggi a Gerusalemme in occasione delle maggiori feste religiose annuali, erano, per quanto possibile, osservate dagli Ebrei. Soprattutto le offerte non venivano mai negate, e Giuseppe (1) osserva, riguardo al saccheggio del Tempio operato da Crasso, non dover recar meraviglia che vi fossero raccolte simili ricchezze, poiché tutti gli Ebrei dai 20 anni in su, e i proseliti di tutto il mondo, avevano, fino dall'antichità, recato tali offerte. Quasi in ogni città esisteva a tal uopo una cassa per il denaro sacro; e in date stabilite venivano designati gli uomini più degni per trasportare a Gerusalemme la somma raccolta (2).

Quando, dopo la distruzione del Tempio, il δίδραχμον fu cambiato in un'imposta a Roma, il popolo ebraico affermò la propria coesione interna mediante tributi volontarî, e una parte almeno delle offerte rituali furono devolute annualmente al patriarcato. La raccolta avveniva per opera di appositi messi del Patriarca, i così detti Apostoli, e a volte del Patriarca stesso, che compieva viaggi nella Diaspora.

***

Due correnti religiose si andavano affermando fra gli Ebrei alessandrini: una che si atteneva alla forma esteriore dell'ebraismo; e un'altra che accoglieva il contenuto spirituale della *Thorà*, adattandolo alla pratica religiosa. Filone, come è noto, si adoperò nei suoi scritti per fondere queste due tendenze, e in fondo anch'egli, con la sua interpretazione allegorica della Sacra Scrittura, contribuì solo ad un appianamento dell'ebraismo. Ma a lato di questa stretta comunione con gli altri abitanti di Alessandria per consuetudini di vita, lingua e organizzazione, gli Ebrei mantenevano, come si è detto, uno scambio attivo con la Palestina, con Gerusalemme, dove avevano una sinagoga propria (3).

(20)

Even the rules for offerings at the Temple and for the pilgrimage to Jerusalem and on the occasion of the major annual religious festivals were, as far as possible, observed by the Jews. Above all, the offerings were never denied, and Josephus (1) observes, regarding the sacking of the Temple carried out by Crassus, that it should not be surprising that such riches were collected there,
since all the Jews aged 20 and over, and the proselytes of all world, had, since ancient times, brought such offerings. For this purpose there was a chest for sacred money in almost every city; and on established dates the most worthy men were designated to transport the collected sum to Jerusalem (2).

When, after the destruction of the Temple, the ÿÿÿÿÿÿÿÿÿ was changed to a tax in Rome, the Jewish people affirmed their internal cohesion through voluntary tributes, and at least part of the ritual offerings were donated annually to the patriarchate. The collection took place through the work of special messengers of the Patriarch, the so-called Apostles, and sometimes of the Patriarch himself,

who made trips to the Diaspora.

Two religious currents were establishing themselves among the Alexandrian Jews: one which adhered to the external form of Judaism; and another which accepted the spiritual content of the *Torah,* adapting it to religious practice.
Philo, as is known, worked in his writings to merge these two tendencies, and ultimately he too, with his allegorical interpretation of the Holy Scripture, only contributed to a leveling of Judaism. But alongside this close communion with the other inhabitants of Alexandria due to habits of life, language and organisation, the Jews maintained, as has been said, an active exchange with Palestine, with Jerusalem, where they had their own synagogue (3).

(1) ***Bell. Jud.*** **1, 8, 8 § 179.** **(2) By i JUSTER, I p . 377 .**
(3) HAMBURGER, op . cit. , p. 48 .

Nel periodo di cui ci occupiamo, gli Ebrei usavano comunemente la lingua greca, sebbene ancora nel II sec. av. Cr. troviamo a Tebe quietanze in aramaico (1), generalmente usato prima del periodo ellenistico, come per esempio nei famosi papiri di Elefantina del V e IV sec. av. Cr. Del resto, nessuna disposizione vietò mai l'uso dell'ebraico. Nelle funzioni religiose sembra che abbia avuto una parte — secondo alcuni preponderante — la lingua greca; l'ebraico, infatti, pare fosse poco usato correntemente, tanto che nelle iscrizioni tombali veniva adoperato molto il greco oltre che l'ebraico (2).

Sebbene in genere gli Ebrei, anche in Egitto, adottassero il proprio calendario, pure vi sono alcune epigrafi funerarie che contengono datazioni di uso comune; così, nella iscrizione trovata in un cimitero di Alessandria è la data (3): ἔτους β καίσαρ[ος] Μεχεῖρ κ' (= 14 Febbraio 28 av. Cr.), e in quello di Tell el-Jehudieh ne abbiamo varî esempî (4): Σάββαθε χρηστὲ πασίφιλε χαῖρε ὡς ἐτῶν ξ' ἔτους κς' Παῦνι κζ' (essendo la necropoli dell'epoca di Augusto, l'anno 26 = 5/4 av. Cr., quindi 24 Pauni = 20 Maggio 4 av. Cr.);

Νίκη ἄορον, ἐτῶν λ' · Ἀθὺρ ια' ἔτους κ' (= 7 Nov. 11 av. Cr.);

Ἔτους λ' Φαρμοῦθι κζ'. Ἰησοῦς (5) Σαμβαίου ἄωρε ἄτεκνε χρηστὲ χαῖ[ρ]ε (anno 30 di Augusto = 25 Aprile 1 d. Cr.); ecc.

È interessante rilevare la consuetudine degli Ebrei di Alessandria di festeggiare l'anniversario della traduzione della Bibbia da parte dei 70, riunendosi a banchetto nell'isola

(1) In un papiro del 200 circa av. Cr. (acquistato a Luxor), dell'età ellenistica, come vedesi dai nomi proprî greci, è un registro di conti di un mercante ebreo. (*Proceedings Soc. of Biblic. archaelogy* 29 (1907) pp. 260-272. Cfr. SCHÜRER, III p. 49 e WILCKEN, *Ostr.*, n. 1233).

POxy. 816 (25° anno di Augusto), e PLond. III p. 25 (105 d. Cr.), e ricorre spesso negli ostraca (WESSELY, *Stud.*, 13 (1913) pp. 8 e segg.; *Archiv* VI p. 220).

Machine Translated by Google

In the period we are concerned with, the Jews commonly used the Greek language, although still in the 2nd century. av. Cr. in Thebes we find receipts in Aramaic (1), generally used before the Hellenistic period, as for example in the famous Elephantine papyri of the 5th and 4th centuries. av. Cr. Moreover, no provision ever prohibited the use of Hebrew. The Greek language seems to have played a role - according to some, a predominant one - in religious functions; Hebrew , in fact, seems to have been little commonly used, so much so that Greek as well as Hebrew was used a lot in tomb inscriptions (2).

Although in general the Jews, even in Egypt, adopted their own

calendar, there are also some funerary epigraphs that contain commonly

used datings; thus, in the inscription found in a cemetery of Alexandria there is the date (3): ***ÿÿÿÿÿ ÿ ÿÿÿÿÿÿ[ÿÿ]*** ÿÿÿÿ ÿ' (= 14 February 28

BC), and in that of Teli el-Jehudieh we have various examples (4) : ***ÿÿÿÿÿ ÿÿ ÿÿÿÿ*** ÿ' ***ÿÿÿÿÿ*** ÿÿ-' ÿÿÿÿÿ ÿÿ' ***ÿÿÿÿÿÿÿ ÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿ***

נפשו בצרור החיים

« Riposi l'anima di Eleazaro nel fascetto della vita » (3).

Vi sono inoltre raffigurati un candelabro a sette bracci e un cipresso: è così comprovato come anche in Egitto fossero comuni i motivi di figurazioni funerarie usate largamente pure in Italia, secondo dimostrarono gli scavi eseguiti nei cimiteri ebraici di Venosa, di Monteverde presso Roma, e altrove.

La vita pubblica e privata degli Ebrei in Egitto nell'età ellenistica e romana.*

Tornando ai rapporti col paese dove abitavano, va notato che gli Ebrei erano compresi nei censimenti generali della popolazione, che venivano eseguiti ogni 14 anni, ed erano obbligati alle denunzie di nascita e di morte all'autorità locale.

Questo ci viene provato, oltre che dal papiro BGU. 1140, di cui abbiamo parlato a proposito della cittadinanza alessandrina, anche da un papiro del 4° anno di Traiano (101 d. Cr.) trovato nel Nômo di Arsinoe, dove un padre denunzia la morte del figlio Giuseppe, ancor piccolo, e perciò non compreso nell'ultimo censimento (1).

---

* *Continuazione e fine* (vedi fascicolo preced. III-IV (1921) pp. 253-275, con l'avvertenza e la nota bibliografica in principio).

(1) BGU. 1068 (cfr. *Archiv* IV, pp. 561 e segg.): Ἰσιδώρῳ βασιλικῶ γραμματεῖ.... παρὰ Σωτελοῦς τοῦ Ἰωσήπου τοῦ Θεόμνατος μετρὸς Ἐρωτίου ἀπὸ κώμης Ἀπωλλωνιάδος. Ὁ υἱός μου Ἰωσήπος μητρὸς Σάρρας ἀφήλιξ μήπω καταλήξας εἰς λαογραφίαν ἐτελεύτησε τῶ Τυβῖ μηνὶ τοῦ ἐνεστῶτος τετάρτου ἔτους Τραιανοῦ Καίσαρος τοῦ κυρίου. διὸ ἀξιῶ ταγῆναι αὐτὸν ἐν τοῖς τετελ(ευτηκόσι). Questo papiro ha grande importanza anche perché per la prima volta si apprende che le dichiarazioni di morte — che importavano naturalmente la soppressione del testatico — venivano trasmesse dallo scriba reale a quello locale, per la conferma della verità della dichiarazione. Cfr. anche, per le denunzie della composizione delle famiglie ai fini della tassa, WILCKEN, *Ostr.* I, 436. La parola λαογραφία, oltre che in varî papiri (vedi PTebt. I, p. 447 e *Philologus* 71 (1912) pp. 24 e segg.), si trova nel III Maccabei (unica volta che ricorra in testi letterarî) e ha il valore indubbio di « censimento della popolazione », mentre era prima considerato un semplice testatico introdotto da Augusto: un'imposta era però certo dovuta da chiunque veniva compreso nella λαογραφία. Così, si riferisce al testatico di un Ebreo l'ostrakon di Luxor del 103-4 d. Cr., trovato insieme con

Machine Translated by Google

referring to the relations with the country where they lived, it

should be noted that the Jews were included in the census -

general ments of the population, which were carried out

every 14 years, and were obliged to submit birth and death reports to the local authority.

This is proven to us, as well as by the BGU papyrus. 1140, which we talked about in relation to Alexandrian citizenship, also from a papyrus from the 4th year of Trajan (101 d.
Cr.) found in the Nómo of Arsinoe, where a father reports the death of
his son Giuseppe, still small, and therefore not included in the last census (1).

**** Continuation and end*** **(see previous issue Iii—IV (1921) pp. 253-275, with the warning and bibliographical note at the beginning).**

**(1) BGU. 1068 (cfr. *Archiv* IV, pp. 561 e segg.): Isidyro royal secretary... than Sotelus of Josephus of Theomnatus count of Erotius by Count Apolloniados. My son Iosipus, mother of Saras, who was born in folklore, died in the month of TybT in the current fourth year of Trajan Caesar of the Lord, for this reason I call him
one of the twenty-fourths.
This papyrus is also of great importance because for the first time we learn that
the declarations of death - which naturally involved the suppression of the testament - were transmitted from the royal scribe to the local one, to confirm the truth of the declaration. See also, for reports on the composition of families for tax purposes, WILCKEN, *Ostr.* I, 436. The word ÿÿÿÿÿÿÿÿÿ, as well as in various papyri (see PTebt. I, p. 447 and *Philologus* 71 (1912) pp. 24 and following), is found in III Mac-cabei (the only time it occurs in texts literary) and has the undoubted value of a "population census", whereas it was previously considered a simple testament introduced by Augustus: a tax was however certainly due by anyone included in the ÿÿÿÿÿÿÿÿÿ. Thus, the ostrakon of Luxor from 103-4 AD refers to the head of a Jew. Cr., found together with**

Sotto i Tolemei gli Ebrei erano assoggettati a un' imposta speciale assai grave, dovuta tanto dai liberi quanto dagli schiavi d'ambo i sessi, fra i tre e i sessant' anni: si tratta forse di capitazione particolare esclusiva agli Ebrei (e non di una tassa comune a tutti) mantenuta dai Romani e detta, già in documenti del I secolo d. Cr. (1), *τέλεσμα Ἰουδαίων*, dell'ammontare di otto dracme e due oboli egiziani (corrispondenti a due dracme attiche e quindi a due danari romani): questa — sembra a torto — fu dal Wilcken (2), dal Wessely e da altri, identificata col fiscus judaicus dovuto dagli Ebrei di tutto l' Impero a Roma, a beneficio di Giove Capitolino, in continuazione del mezzo siclo (due dracme) prima versato annualmente a favore del Tempio di Gerusalemme (*ἱερὰ χρήματα*) (3): esso data dunque dal 71 e fu imposto da

---

un registro di tasse pagate da Ebrei, tenuto da un Δωσαρίων Ἰησοῦτος, (*Archiv* VI p. 220): Σαμβαθίω(ν) δ καὶ Ἰησοῦς Πανοῦ λαο(γραφίας) ζ (ἔτους) Τραιανοῦ τοῦ κυρίου (δραχμὰς) δ (Ἔτους) ζ Παζώ(ν) (vedi WILCKEN, *Archiv* II, p. 395; *Ostr.* I, p. 230; MITTEIS-WILCKEN, *Grundz.* I, pp. 172 e 174; cfr. MOTZO in *Entaphia* ecc., cit., pp. 226-27).

(1) Papiro dell' Arsinoite del V anno di Vespasiano (72-73 d. Cr.), pubblicato dal WESSELY in *Stud. Pal.* IV, pp. 58 e segg.; cfr. anche I, pp. 9-11, e *Actes du XIV*[e] *Congrès des Orientalistes,* Alger, (1905), T. II, Sez. II, pp. 17-22. È una nota, redatta dall'ἀμφοδάρχης del quartiere della città Ἀπολλωνίου παρεμβολή nell' Arsinoite, di coloro che sono sottoposti al pagamento dell' Ἰουδαικὸν τέλεσμα; vengono qui tassate solo donne e bambine: forse gli uomini erano compresi in un elenco a parte, ma intanto da questo documento se ne apprendono i nomi:

Τρύφαινα, esclusa dalla tassa per l'età di 61 anni.
Δωσάριον, figlia di Ἰακοῦβος e della Σάμβους, moglie di Σίμων, dell' età di 22 anni.
Φίλους, figlia di [....] e della Πτόλλους, moglie di Θεόδωρος, di 20 anni.
Σαμβαθίς figlia di Σαβῖνος e della Ἥραις, moglie di Θηγενῆς, di 18 anni.
Σ[...., figlia di....] e della Θεύδους, moglie di Σάμβαθ(ος), di 1[.] anni.
Ἐρώτιον [figlia di....] e della Εὐτέρπη, moglie di Πτόλλας, di 22 anni.
Bambine: Πρώτους di Θεόδορος e della Φίλους di 5 anni.
Πρώτους di Σίμων e della Δωσάριον di 4 anni.

(2) *Grundz.* I, p. 187 e II, p. 82.

(3) All'ammontare di tale contribuzione sembrano riferirsi due ostraka aramaici di Apollinopolis Magna, che secondo il LIDZBARSKI (*Ephem. Epigr.* 2, pp. 243 e segg.) sarebbero del II sec. av. Cr. (cfr. peraltro JUSTER I, p. 378 n. 6), e un ostrakon analogo, probabilmente contemporaneo, proveniente da Kom el-Amar, nelle vicinanze della città moderna di Minieh Medio Egitto). Vedi *Rev. Étud. Juiv.* 65 (1913) pp. 16-23.

Under the Ptolemies the Jews were subjected to an im -
post a special and very serious, due both by free men and slaves of both sexes, between the ages of three and sixty: it is perhaps a particular capitation exclusive to the Jews (and not a tax common to all) maintained by the Romans and mentioned, already in documents from the 1st century AD. Cr. (1), ***ÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿ,*** of the amount of eight drachmas and two Egyptian obols (corresponding to two Attic drachmas and therefore to two Roman denarii): this - it seems wrongly - was from Wilcken (2), from Wessely and from others, identified with the fiscu s judaicu s owed by the Jews of the whole Empire to Rome, for the benefit of Jupiter Capitolinus, in continuation of the half shekel (two drachmas) previously paid annually in favor of the Temple of Jerusalem (3): it

ÿiepà ÿÿÿÿÿÿÿ) therefore dates from 71 and was imposed by

un registro di tasse payate da Ebrei, tenuto da un Dosarion Iesutos, *(Archiv* VI p. 220) : Samva^io(n) d and 'Jesus Panos Iao(grafias) g (year) Trajan of the lord (drachma) d (" Etus) z Pazoi(n) (vedi WILCKEN, *Archiv* II, p. 395 ; *Ostr.* I, p. 230; MITTEIS-WILCKEN, *Grundz.* I, pp. 172 e 174; cfr.

etc. **MOTZO in *Entaphia* cit. , pp. 226-27).**

(1) Arsinoite papyrus from the 5th year of Vespasian (72-73 AD), published by WESSELY in *Stud. Pai.* IV, pp. 58 et seq. ; see also 1, pp. 9-11, and *Actes du XIVe Congrès des Orientalistes,* Alger, (1905), ÿ. II, Section. II, pp. 17-22. It is a note, drawn up by the ÿÿcpoÿÿpÿÿÿ of the city district 'ÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿ in Arsinoite, of those who are subjected to the payment of the ÿÿÿÿÿÿÿÿÿ ÿÿ'ÿÿÿÿÿ; only women

and girls are taxed here: perhaps men were included in a separate list, but in the meantime their names are learned from this document: ÿÿÿÿÿÿÿÿ, excluded from the tax at the age of 61. ÿÿÿÿÿÿÿÿ, daughter of ÿÿÿÿÿÿÿÿ and ÿÿÿÿÿÿÿ,

wife of ÿÿÿÿÿ, of the age

22 years old.
Filous, figlia di [....] e della Ptollous, moglie di Theodoros, di 20 anni. Samvais

figlia di Savinos and della Thirais, moglie di Thigenis, di 18 anni. ÿ{ , figlia di.. . .] e della Theudos, moglie di Samva^(os), di 1[.] anni. Erotion [figlia di....] e della Euterpi, moglie di Pto'llas, di 22 anni.
Bambine : Proitous di Theodoros e della Filous di 5 anni. First of

Simon and della Dosarion di 4 anni. (2) *Grundz.* I, p. 187 and II, p. 82.

(3) Two Aramaic ostraka from Apollinopolis Magna seem to refer to the amount of this contribution, which according to LIDZBARSKI *(Ephem. Epigr.* 2, pp. 243 et seq.) would be from the 2nd century. av. Cr. (see also JUSTER 15. p. 378 n. 6), and a similar ostrakon, probably contemporary, coming from Kom el-Amar, near the modern city of Minieh.

Middle Egypt). See *Rev. Etud. Juiv.* 65 (1913) pp. 16-23.

Vespasiano, mentre il τέλεσμα è menzionato in documenti anteriori e, a differenza di quest'ultimo, è dovuto solamente dagli uomini, ma anche oltre i sessant'anni, e a partire dai 20 anziché dai 3 anni.

Un'altra contribuzione — secondo il Wessely (1) — era dovuta dagli Ebrei al fisco, in relazione all'antico rito ebraico dell'offerta delle primizie (ἀπαρχή) (2), nella misura di 1 dracma. L'ammontare di queste due tasse (il τέλ. Ἰουδ. e l'ἀπ.), sarebbe dato, ad es., dall'ostrakon seguente (3): δ⁻ ἀμφόδ'(ου) Δωσαρίων Ἰησοῦτος Ἰουδ'(αίων) τε'λ'(έσματος) α (ἔτους) Τραιανοῦ τοῦ κυρίου (δραχμὰς) Θ (ὀβολοὺς δύο) ἐπ ειφ δ⁻.

Infine, la contribuzione fissa che tutti gli Ebrei devolvevano a favore del patriarca palestinese, alla cessazione del patriarcato venne incassata dagli imperatori romani (*Aurum coronarium*).

Sull'esistenza di varie imposte comuni a Ebrei e a non Ebrei ci fanno fede lunghe liste di contribuenti di Apollinopolis Magna pubblicate dal Wessely (4), dalle quali apprendiamo che venivano pagate tasse per mandrie di montoni e di pecore, (φόρος προβάτων) (5), per guardie campestri, per custodi (φυλακιτικόν – ὑπὲρ σκοπελῶν), per dighe (χώματα), per bagni, per vigne (6), ecc.

Abbiamo inoltre un ruolo di capitazione del I sec. d. Cr. con nomi ebraici e non ebraici (7), e un altro della stessa epoca, per imposte in natura (8).

Interessante è un papiro di Psenyris nell' Arsinoite, intorno al III sec. av. Cr., il quale ci prova come all'epoca Tolemaica esistesse forse una specie di consorzio tra gli Ebrei per le loro contribuzioni individuali, essendo essi nominati con l'espressione complessiva παρὰ τῶν Ἰουδαίων (1); ma già verso il 150-140 av. Cr. troviamo su di un ruolo d' imposte fondiarie singoli nomi di contribuenti ebrei e non ebrei (2).

Per i possessori di schiavi esisteva pure una tassa dovuta εἰς τὰ ἀποδόχια τῆς κώμης tanto dagli Ebrei quanto dagli Elleni, in ragione di mezza dracma (ς) per ogni schiavo (ἑκάστου σώματος).

Una lunga lista di debitori di una tassa per imposta fondiaria si ha in un papiro del II sec. av. Cr. del Fayum: si tratta però forse di Samaritani (3).

***

Numerosissimi erano gli Ebrei ridotti in schiavitù in massa dai Tolemei; così il Pseudo Aristea narra che Tolemeo I Lagide ne avrebbe condotti seco 100.000 dalla Palestina (4), e Tolemeo Latiro avrebbe tratto 10.000 schiavi dapprima e molti altri in seguito, per vendicarsi di aver avuto contro di sé generali ebrei (5). Abbiamo poi esempî di schiavi singoli: così sotto Tolemeo III Evergete, nel 238-7, ne troviamo uno ad Arsinoe (6). Né si limitò la schiavitù al periodo Tolemaico: in un papiro di Ossirinco del 291 d. Cr. (7) è narrato che la comunità riscatta uno schiavo ebreo e i suoi due figli, pagando una somma a dei pagani.

D'altra parte a Psenyris, verso il 230 av. Cr., esistevano già Ebrei possessori di schiavi, come rilevasi da un papiro citato (8).

(28) ;

Interesting is a papyrus of Psenyris in Arsinoite, around the 3rd century. av. Cr., who proves to us that in the Ptolemaic era there was perhaps a kind of consortium among the Jews for their individual contributions, they being named with the overall expression ***ÿÿÿÿ*** ÿÿÿ ***ÿÿÿÿÿÿÿÿ/*** (1) ; but already around 150-140 BC. Cr. we find individual names of Jewish and non-Jewish taxpayers on a land tax roll (2).

Per i possessori di schiavi esisteva pure una tassa doutta "s the ***apodochies of the count*** tanto dagli Ebrei quanto dagli Elleni, in ragione di mezza dracma **(s)** per ogni schiavo (of each ***body).***

A long list of debtors for a land tax is found in a papyrus from the 2nd century. a\r. Cr. of the Fayum : however, they are perhaps Samaritans (3).

Very numerous Jews were enslaved -

victuals en masse from the Ptolemies ; thus the Pseudo Aristea

narrates that Ptolemy I Lagis would have brought with him 100,000

from Palestine (4), and Ptolemy Latyrus would have taken 10,000

slaves first and many others later, to take revenge for having had

Jewish generals against him (5). We then have examples of

individual slaves: thus under Ptolemy III Evergetes, in 238-7, we

find one in Arsinoe (6). Nor was slavery limited to the Ptolemaic

period: in a papyrus of Oxyrhynchus from 291 AD. Cr. (7) it is narrated that the community redeems a Jewish slave and his two

sons, paying a sum to pagans.
On the other hand in Psenyris, around 230 av. Cr., there were

already Jews who owned slaves, as can be seen from a cited papyrus (8).

***

È comprovato da numerose fonti che gli Ebrei hanno sempre prestato molto estesamente il servizio militare in tutto il periodo che stiamo esaminando: già prima, nel V sec. av. Cr., a Elefantina e ad Abido erano, come vedemmo, colonie militari ebraiche; alla venuta in Egitto di Tolemeo I, dei 100.000 Ebrei palestinesi da lui condotti in schiavitù, 30.000 sono posti a guardia delle piazze forti in virtù della loro fedeltà e della loro segregazione dagli altri abitanti, a quanto almeno ci attesta Giuseppe, desumendolo dal Pseudo Aristea (1); da lui pure (2) sappiamo che Alessandro stesso invitò Ebrei e Samaritani a far parte del proprio esercito, e che ai secondi fu affidata la guardia della Tebaide; a prova di questo è attestata l'esistenza di un villaggio detto Σαμαρεία proprio nella Tebaide, dal III sec. av. Cr. al III sec. d. Cr. (3); e che soldati ebrei abbiano servito sotto Tolemeo I è comprovato dalle più antiche iscrizioni ebraiche di Alessandria (4).

Sotto Tolemeo II (283-247) sono pure soldati ebrei, come prova un frammento di una transazione (5) su di un litigio avvenuto nel 259 a Phebichis (Heracleopolis) tra Andronico e l'Ebreo Alessandro figlio di Andronico, appartenente forse, secondo il Bouché-Leclercq (6), ad un reggimento di cavalleria (τῶν Ζώιλου δεκανικοῦ). Militari ebrei sono citati sotto Tolemeo III tra gli αἰχμάλωτοι ἀπὸ τῆς Ἀσίας, i veterani ai quali venivano distribuite terre a seconda del grado (7). Due Ebrei, Dositheos e Onias, comandano l'esercito egiziano sotto Tolemeo VI Filometore e Cleopatra II (8), e lo stesso Onias (9)

(9) Non si sa chi fosse questo Onias, ma sembra certamente distinto dal Sacerdote Onias di Leontopolis, per quanto non lo precisi Giuseppe Flavio (*Contra Apion.*, 2, 5).

Machine Translated by Google

It is proven by numerous sources that the Jews have always provided military services very extensively throughout the period we are examining : already before, in the fifth century. av. Cr., Elephantine and Abydos were, as we have seen, Jewish military colonies; upon the arrival of Ptolemy I in Egypt, of the 100,000 Palestinian Jews he led into slavery, 30,000 were placed to guard the strongholds by virtue of their loyalty and their segregation from the other inhabitants, according to at least what Josephus attests to us, deducing it from the Pseudo Aristeas (1) ; from him also (2)

we know that Alexander himself invited Jews and Samaritans to
be part of his army, and that the latter were entrusted with the guard of the Thebaid; proof of this is the existence of a village called ***ÿÿÿÿÿÿÿÿ*** right in the Thebaid, from the 3rd century. av. Cr. to the 3rd century. d. Cr. (3) ; and that Jewish soldiers served under Ptolemy I is proven by the most ancient Jewish inscriptions of Alexandria (4).

Under Ptolemy II (283-247) they were also Jewish soldiers, as evidenced by a fragment of a transaction (5) on an argument which took place in 259 in Phebichis (Heracleopolis) between Andronicus and the Jew Alexander son of Andronicus, perhaps belonging, according to the Bouché-Leclercq (6), to a cavalry regiment (ÿÿÿ ***ÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿÿ).*** Jewish soldiers are mentioned under Ptolemy III among the ***ÿÿÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿ 'ÿÿÿÿÿ,*** the veterans to whom lands were distributed according to rank (7). Two Jews, Dositheos and Onias, command the Egyptian army under Ptolemy VI Philometor and Cleopatra II (8), and Onias himself (9)

(8) For having leaned heavily on the Jewish party, the queen surrendered unpopular with the Alexandrians (see BOUCHE-LECLERCQ II, p. 58, ÿ. 1).

(9) It is not known who this Onias was, but he certainly seems distinct from the Priest Onias of Leontopolis, although Josephus does not specify *(Contra Apion.,* 2, 5).

conduce le forze armate della regina e di suo figlio Tolemeo VIII Eupatore (1) contro il fratello del defunto sovrano, Tolemeo VII Fiscone Evergete II, sostenuto dai Romani guidati da L. Minucio Termo: perciò forse Tolemeo VII, salito al trono, perseguita, sebbene per breve tempo, gli Ebrei (2). Alla sua morte, la vedova Cleopatra III e suo figlio Tolemeo XI Alessandro hanno come generali, nel combattimento avvenuto verso il 105-4 contro Tolemeo X Latiro o Sotere II, gli Ebrei Helkias e Ananias, figli di Onias (3).

Forse è un generale ebreo quell' Ἐλεάζαρος Νικολάου ἡγεμών di un' iscrizione del Fayum (4) di epoca imprecisata, ma precristiana, come rilevasi dalla forma delle lettere (5); e così pure l'altro Χελκίου στρατηγός (forse figlio di quel Helkias nominato sopra), che viene onorato col conferimento di una corona d'oro, ricordato in un frammento d'iscrizione in marmo bianco del 102 circa av. Cr. (6).

Gli Ebrei militano in seguito sotto Tolemeo Aulete, figlio di Latiro, e poi sotto Tolemeo XIII Dioniso, contro Cleopatra VI, finché passano dalla parte di lei, sostenuta da Cesare.

Anche sotto i Romani essi continuarono a prestar servizio militare, come del resto la forza delle cose imponeva: perché i soldati erano contemporaneamente coloni (7), e se fossero stati licenziati i reparti ebraici assai numerosi, ne

(30);

leads the armed forces of the queen and her son Ptolemy VIII Eupator (1) against the brother of the deceased sovereign, Ptolemy VII Physcone Evergetes II, supported by the Romans led by L. Minucius Termus: therefore perhaps Ptolemy VII, having ascended the throne, persecutes, albeit for a short time, the Jews (2). Upon his death, the widow Cleopatra III and her son Ptolemy XI Alexander had as generals, in the battle that took place around 105-4 against Ptolemy

Perhaps that ***ÿÿÿÿÿÿÿÿÿ*** ÿÿÿÿÿÿÿ in a
Fayum inscription (4) of an unspecified but pre-Christian era, which can be seen from the shape of the letters (5), is a Jewish general; and so does the other ÿÿÿÿ^ÿ ***ÿÿÿÿÿÿÿÿÿ*** (perhaps the son of that Helkias mentioned above), who is honored with the awarding of a golden crown, remembered in a fragment of an inscription in white marble from around 102 BC. Cr. (6).

The Jews subsequently militated under Ptolemy Auletes, son
of Latyrus, and then under Ptolemy XIII Dionysus, against Cleopatra VI, until they switched to her side, supported by Caesar.

Even under the Romans they continued to provide military service, as the force of things dictated: because the soldiers were at the same time colonists (7), and if the very numerous Jewish units had been dismissed, they

(7) We have many testimonies of the use of prisoners and Jewish soldiers or veterans in agriculture, especially in the Fayum: many figure among the ÿÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿ 'ÿÿÿÿÿ, who become owners of the lands previously given to them in usufruct, in second year of Ptolemy III Evergete (PPetrie II, nn. 29-31 ; cf. BOUCHE-LECLERCQ I, p. 264, n. 2). Jews figure among the ÿÿÿÿÿÿÿÿ, who appear to have been soldiers in active service, of foreign origin, to whom the ÿÿÿÿÿÿ, plots of land to cultivate, which were handed down from father to son, had been distributed (see SCHUKER III, p. 33; see also PFreib. 7 and related article by LESQUIER in *Rev, Et. Gr* 32 (1919) pp. 359 et seq.).

Nikolaos y

sarebbe derivato uno sconvolgimento nella vita della regione: perciò, come i reparti egiziani, così quelli di soli Ebrei passarono al servizio dei Romani; e anche se, in seguito, furono forse sciolti sotto Traiano e Adriano i reparti organici, certamente non furono esentati dal servizio militare i singoli Ebrei, come prova un papiro di Ossirinco del 205 d. Cr. (1), contenente una lista di soldati, fra i quali figurano nomi certamente ebraici (2).

È noto che poi verso il 400 è a più riprese vietato l'arruolamento di Ebrei negli eserciti dell'impero romano, divieto rinnovato da Teodosio e da altri.

Anche nel servizio di polizia si arruolavano Ebrei; così, nella iscrizione riportata più sopra del tempio di Athribis, sotto Tolemeo VI, è ricordato Πτολεμαῖος Ἐπικύδου ὁ ἐπιστάτης τῶν φυλακιτῶν, probabilmente ebreo (3).

Erroneamente credevasi, da un passo di Filone (4), che in Egitto fosse proibito il porto d'armi solo agli Ebrei, mentre invece è stato trovato un papiro (5) recante la proibizione di portare armi per tutti, emanata da Flacco nel 33-4 d. Cr. (21° anno di Tiberio), proibizione che già esisteva al tempo dei Lagidi.

***

Numerosi sono gli esempi di Ebrei che occupavano cariche pubbliche.

Molto sovente l'arabarca (o alabarca), che era, a quanto sembra, il controllore delle esazioni delle tasse doganali (6), è ebreo, come ad Alessandria Alessandro (7), padre di Tiberio Giulio Alessandro e fratello di Filone, e Demetrio,

you know it caused an upheaval in the life of the region : therefore, like the Egyptian units, so those of only Jews passed into the service of the Romans; and even if, subsequently, the organic units were perhaps disbanded under Trajan and Hadrian, individual Jews were certainly not exempted from military service, as evidenced by a papyrus of Oxyrhynchus from 205 AD. Cr. (1), containing a list of soldiers, among which certainly Jewish names appear (2).

It is known that then around 400 the enlistment of Jews in the

armies of the Roman Empire was prohibited on several occasions, a ban renewed by Theodosius and others.

Jews also enlisted in the police services; thus, in the inscription reported above from the temple of Athribis, under Ptolemy VI, ***ÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿ*** a ÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿ, probably Jewish (3), is mentioned.

It was erroneously believed, from a passage in Philo (4), that in Egypt only the Jews were prohibited from carrying weapons, while instead a papyrus (5) was found containing the prohibition on carrying weapons for all, issued by Fiacco in 33-4 AD. Cr. (21st year of Tiberius), a prohibition that already existed at the time of the Lagides.

There are numerous examples of Jews who occupied ca - rich and public.

Very often the arabarca (or 1 abarca), who was, apparently, the controller of customs tax collections (6), is Jewish, as in Alexandria Alexander (7), father of Tiberius Julius Alexander and brother of Philo, and Demetrius,

diritto di proprietà, ed erano in possesso di terre, tanto prima quanto dopo l'occupazione romana: ciò rilevasi, ad esempio, da un papiro del territorio alessandrino del 13 av. Cr. (1), e da un altro di Cinopoli del 117 d. Cr. (2) riflettente le proprietà fondiarie degli Ebrei dell' Ossirinchite e della Cinopolite, che sembra fossero state confiscate in seguito alla guerra del tempo di Adriano e di Traiano. Ma probabilmente essi godevano di diritti ben maggiori dove erano cittadini greci, come ad Alessandria.

***

Fra le occupazioni private degli Ebrei nel nostro periodo, tiene il primo posto l'agricoltura: ad essa erano dedite, quasi senza eccezione, le colonie dei militari condotti dai Tolemei. Nel 244 Tolemeo III Evergete distribuisce ai veterani degli appezzamenti di terre, o li pone a lavorare sotto dei proprietarî; e tra gli αἰχμάλωτοι ἀπὸ τῆς Ἀσίας figurano anche molti Ebrei; chi possedeva la cittadinanza alessandrina o una diversa, la mantenne. Troviamo poi nominati in varî documenti, almeno fino al II sec. d. Cr., proprietarî di terre ed operai salariati per il lavoro (3).

Sono menzionati affittuarî a Ghorân (Fayum) nel 260-59 av. Cr. (4), e tre altri, Θεόδοτος, Γαδδαίος (5) e Φανίας, a Magdola (6), che nel 25° anno di Tolemeo Evergete I querelano certo Demetrio, proprietario delle terre da loro prese in affitto, perché era contravvenuto ai patti del nolo. Nel II secolo av. Cr. ne troviamo a Diospolis (Ἰώσηπος Ἀβδίου (7), Σίμον Ἑρμίου (8), Πυθάγγελος Ἰωσήπιος (9), Σαμβαταῖος

(34) ;

property rights, and were in possession of lands, both before and after the Roman occupation: this can be seen, for example, from a papyrus from the Alexandrian territory of 13 BC. Cr. (1), and from another from Cinopoli from 117 AD. Cr. (2) reflecting the land holdings of the Jews of Oxyrhynchite and Kinopolite, which appear to have been confiscated following the war of the time of Hadrian and Trajan. But they probably enjoyed far greater rights where they were Greek citizens, as in Alexandria.

Among the private occupations of the Jews in our period, agriculture holds first place: almost without exception, the military colonies led by the Ptolemies were dedicated to it. In 244 Ptolemy III Evergetes distributed plots of land to the veterans, or placed them to work under owners; and among the *ÿÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿ 'ÿÿÿÿÿ* there are also many Jews; whoever possessed Alexandrian citizenship or a different one retained it. We then find names in various documents, at least until the 2nd century. d. Cr., landowners and workers paid for the work (3).

Tenants in Ghoràn (Fayum) in 260-59 BC are mentioned. Cr. (4), and three others, ***ÿÿÿÿÿÿÿÿ, ÿÿÿÿÿÿÿÿ*** (5) and ***ÿÿÿÿÿÿ,*** in Magdola (6), who in the 25th year of Ptolemy Evergetes I complained to a certain Demetrius, owner of the lands rented by them, because he had contravened to the freight agreements. In the 2nd century BC. Cr. we find them in Diospolis ***{ÿÿÿÿÿÿÿÿ*** ÿ/3- ***èiou*** (7), ***Simon Hermiou*** (8), ***TInthangelos Iosiepios*** (9), ***Samvachaios***

Between-

Ἀβιήλου (1) e altri ancora), a Tebe (2), a Karanis (3), a Ossirinco (4) (nel 130 d. Cr.).

Conosciamo anche operai agricoli dietro mercede ad Arsinoe; in una lettera del 100 circa d. Cr. (5) rilevasi che l'Ebreo Teofilo chiede di essere esonerato dall'impiego, perché sottoposto a lavori agricoli troppo gravosi nei terreni di proprietà del demanio. Un Ebreo Δαλλέας Ἀβραίμου, possessore di gregge, è citato in una lista di debitori di tasse di Apollinopolis Magna (6).

Già in epoca precedente, molti Ebrei si dedicavano in Egitto alla navigazione, consuetudine che si estese sempre più nel periodo da noi studiato. Al tempo di Filone, in Alessandria erano molti armatori di navi (7); un barcaiolo è menzionato, sembra, in un papiro di Ossirinco del 77 d. Cr. (8), e Sinesio in una sua epistola (9) racconta un viaggio compiuto sul naviglio di un Ebreo che osservava il riposo sabbatico alla pari dei marinai, suoi correligionarî.

Per di più, all'epoca romana una corporazione di *navicularii* era formata solo di Ebrei e regolata da apposite leggi romane. E l'ordine emanato da Teodosio il Grande il 18 febbraio 390 (10), secondo il quale dovevano sottostare agli oneri

A/3hilos (1) and altri ancora), a Tebe (2), a Karanis (3), a Ossi- rinco (4) (nel 130 d. Cr.).

We also know hired agricultural workers in Ar-sinoe; in a letter dated around 100 AD. Cr. (5) it is noted that the Jew Teofilo asks to be exempted from employment, because he is subjected to too heavy agricultural work on land owned by the state. A Jew ÿÿÿÿÿ'ÿÿ ***ÿÿÿÿÿÿÿ,*** owner of flocks, is mentioned in a list of tax debtors of Apollinopolis Magna (6).

Already in previous times, many Jews in Egypt dedicated themselves to navigation, a custom that increasingly spread in the period we studied. In the time of Philo, there were many shipowners in Alexandria (7); a boatman is mentioned, it seems, in an Oxyrhynchus papyrus from 77 AD.
Cr. (8), and Synesius in one of his epistle (9) recounts a journey made on the ship of a Jew who observed the Sabbath rest on a
par with the sailors, his co-religionists.

Furthermore, in Roman times a corporation of ***cularii***
was made up only of Jews and regulated by specific Roman laws.

And the order issued by Theodosius the Great on 18 February 390 (10), according to which they had to submit to the burdens

navi-

derivanti dai trasporti soltanto i singoli interessati, fu provocato dalla ingiusta imposizione che il prefetto d'Egitto aveva fatto poco tempo prima alla Comunità intera di provvedere ai trasporti a spese generali, quasi che tutti fossero cointeressati alla funzione disimpegnata dai singoli *navicularii*.

Sul commercio esercitato dagli Ebrei molto diffusamente nel periodo ellenistico e romano, abbiamo notizie in Strabone e in Filone (1); il *Talmud* (2) menziona per quest'epoca artigiani, orafi, gioiellieri, fabbri, armaioli, speziali, ecc.; e nella sinagoga principale di Alessandria ogni maestranza aveva, come già si disse, il suo apposito reparto. Infatti la maggior parte degli Ebrei si era data al commercio, allora fiorentissimo in quella città (3): esso rifletteva soprattutto quello dei grani, essendo l'Egitto considerato come il granaio di molti paesi, specialmente dell'Italia; dei vini, in particolare di quelli artificiali, come, per esempio, il vino di susina, e di due sorte di birra d'orzo; delle vacche, dei maiali, di varie tessiture di cotone, della bambagia, delle tele, del bisso egiziano; inoltre si vendevano in quantità tappeti di porpora, armi, papiri preparati per la scrittura, ecc.; prodotti aromatici confezionati con le droghe, olî, unguenti, e simili; sali, allume egiziano, gomma alessandrina, varie qualità di marmi, smeraldi e altre pietre preziose.

Accanto a questi articoli, che formavano in gran parte materia di esportazione, vi era una grande importazione di mercanzie da tutte le regioni del mondo allora note (4). Così, dalla Palestina veniva l'asfalto che serviva a imbalsamare i cadaveri (5) e il legno di cedro per costruire i templi (6).

Il piccolo commercio era pure fiorente, ed è menzionato in una legge del IV sec.: « *Ioudaei.... vilibus commerciis oc-*

deriving from the transports only the individuals involved, was caused by the unjust imposition that the prefect of Egypt had made shortly before on the entire Community to provide transport at general expenses, almost as if everyone had a shared interest in the function performed by the individual *ships - cularii.*

On the trade practiced by the Jews very widely in the Hellenistic and Roman periods, we have information in Strabo and Philo (1) ; the *Talmud* (2) mentions for this era artisans, goldsmiths, jewelers, blacksmiths, armourers, apothecaries, etc. ; and in the main synagogue of Alexandria each worker had, as already mentioned, his own specific department.
In fact, the majority of the Jews had devoted themselves to trade, which was then very flourishing in that city (3): it reflected above
all that of grains, Egypt being considered as the granary of many countries, especially of Italy; of wines, especially artificial ones, such as, for example, plum wine, and two types of barley beer ; cows, pigs, various cotton weaves, cotton wool, canvas, Egyptian byssus; furthermore, purple carpets, weapons, papyrus prepared for writing, etc. were sold in quantity. ; aromatic products packaged with drugs, oils, ointments, and the like; salts, Egyptian alum, Alexandrine gum, various qualities of marble, emeralds and other precious stones.

Alongside these articles, which were largely exported, there was a large import of merchandise from all the regions of the world known at the time (4).
Thus, from Palestine came the asphalt which was used to embalm the corpses (5) and the cedar wood to build the temples (6).

Small trade was also flourishing, and is mentioned in a law of the 4th century: « Joudaei..., *vilibus commerciis oc-*

cupati » (1); a Giaffa, in epoca imprecisata, è sotterrato un rigattiere di Alessandria (2); nel II sec. av. Cr., troviamo nella Tebaide un mercante di cavalli - *οὗ τὸ ὄνομα ἀγνοοῦμ[εν]* - (3), e un altro mercante senza specificazione di quale commercio esercitasse (4). Ad Alessandria ed altrove erano Ebrei fornai, muratori e falegnami (5).

Nel IV secolo, Claudiano (6) riteneva l'industria della tappezzeria istoriata esclusiva degli Ebrei, e secondo alcuni sarebbero stati appunto essi a introdurla in Egitto e specialmente ad Alessandria, dove era un apposito collegio ebraico, dopo averla appresa in Assiria (7). Un tessitore *γέρδι[ο]ς* è citato fra i contribuenti di Apollinopolis Magna (8).

Il numero degli Ebrei dediti al commercio e all'industria in Alessandria era tanto preponderante, che quando essi furono espulsi da Cirillo, l'eparca Oreste si lamentò di un ristagno negli affari della città (9).

Nella stipulazione dei contratti venivano osservate generalmente le norme locali, modificate poi spesso dal diritto romano, ma a volte, per lo meno in parte, si osservavano anche le forme puramente ebraiche.

Contratti di compra-vendita erano frequentissimi nel no-

cupati » (1); in Jaffa, at an unspecified time, a second-hand dealer from Alexandria was buried (2) ; in the 2nd century. av. Cr., we find
in the Thebaid a horse merchant - où xò ÿÿÿÿÿ ÿÿÿÿÿÿÿÿ.[ÿÿ] — (3), and another merchant without specification of what trade he practiced (4). In Alexandria and elsewhere there were Jewish bakers, bricklayers and carpenters (5).

In the 4th century, Claudian (6) believed that the industry of decorated tapestry was exclusive to the Jews, and according to some it was they who introduced it to Egypt and especially to Alexandria, where there was a special Jewish college, after having learned it in Assyria (7). A weaver ÿ ***ÿÿÿ$ÿ[ÿ\ÿ)*** is mentioned among the taxpayers of Apollinopolis Magna (8).

The number of Jews engaged in trade and industry in Alexandria was so preponderant that when they were expelled by Cyril, the eparch Orestes complained of stagnation in the city's affairs (9).

In the stipulation of contracts, local rules were generally observed, often modified by Roman law, but sometimes, at least in part, purely Jewish forms were also observed.

Purchase and sale contracts were very frequent in the no-

missarì for water services, for 6 months of water consumption, at 128 drachmas (1) per month, and for ÿ ***ÿÿÿÿÿÿÿÿ;*** in Athribis around 130 AD. Cr., Jews together

with Greeks offer the strategist the purchase of a plot of land, paying with a certain quantity of grain (2); in A rsi ÿ ÿ and in the VI-VII century. d. Cr., between Apollo of Anthony, a Christian, and Abraham of Theodotus ***(ÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿ*** ÿÿÿ ***ÿÿÿÿÿÿÿÿ)*** a change of vinegar

with wine takes place (3) ;

in an unspecified location, around the 6th-7th century. d. Cr., certain Aurelius Abraham of Levi and Aurelius Amun of David, hay merchants, deliver a receipt to Gerontius, officer of the general Theodosius **(4).**

Since no Jewish archives reflecting the period we studied have been found so far, we know little about the contracts of Jews among themselves (5).

Very interesting is a papyrus (6) from 59 AD. Cr. of Helio-polis, for the important formulas it contains. I will limit myself here to saying that it is a deposit ***(ÿÿÿÿÿÿÿÿ)*** relating to 600 drachmas, concluded before the market inspector in the military camp of Babylon (Heliopolis) between the ***aeque s alae ÿÿÿÿÿÿÿÿ Vicontiorum ÿÿÿ ÿÿÿÿÿÿÿÿ,*** ÿÿÿÿ ÿ ÿÿÿÿÿ'ÿÿ and his two sons ÿÿÿÿÿÿÿÿ and ÿÿÿ[ÿ'5ÿÿÿ], custodians. It is not a real deposit at interest, but

a simple L. Vettio, depositante, e tre Ebrei ***Jews*** rather loan: the depositor undertakes not to request that sum before two and a half months, and the three Jews undertake to pay after that date, - in the event that they had not returned the entire sum - not double, as they would have had if it had been a real deposit, but only default interest!

(1) Note that the drachma was then worth about a quarter of the common silver drachma (see SCHÎIRER III, p. 48).

(2) POxy. 500.
(3) PLond. 113 n (col. I, p. 223).
(4) Vedi *The Jewish Encyclop.,* s. v. *Palaeography.*
(5) The existence of Jewish archives, generally located in the synagogues,

is also certain for the Hellenistic-Roman era : this is also indirectly attested by FLAV. Jos., *Antiqu.,* 19, 5, 2, § 281; and it appears that a ÿÿÿÿÿÿÿÿ ÿÿÿ 'ÿÿÿÿÿÿÿÿ is mentioned in BGU. 115 8 (13 d. Cr.).

(6) Rev. 2.

del 12 o forse 24 %: *τόκοι τοῦ ὑπερπεσόντος χρόνου δραχμαῖοι* (o *δίδραχμοι* ?), e in più una pena: *ἐπίτιμον*. Inoltre i depositarî s'impegnano a pagare solidariamente: *δι' ἐγ[γ]ύ[ω]ν ἀλλήλων εἰς ἔκτισιν* (1).

Ad Arsinoe, nel 26° anno di Tolemeo II Filadelfo (259 av. Cr.), Andronico *τῆς ἐπιγονῆς* e Alessandro di Andronico, ebreo, con una transazione (*συγγραφὴ ἀποστασίου*) rinunciano a tutti i reciproci reclami (2).

Col denaro guadagnato nel commercio, molti Ebrei divennero banchieri, e ne troviamo in ogni epoca: Giuseppe Flavio (3), ad esempio, narra la storia aneddotica di un certo Giuseppe figlio di Tobia, vissuto sotto Tolemeo V, affittuario divenuto ricco banchiere; e riferisce (4) che l'alabarca Alessandro eseguì un grosso pagamento ad Alessandria, promettendo di completarlo a Pozzuoli. Ad un banchiere ebreo sembra accennare il papiro BGU. 1070 del 41 d. Cr.

Non abbiamo notizie di prestiti ad usura; se ne ha, è vero, un accenno in un papiro d'ignota provenienza, contenente una lettera del 4 agosto 41 d. Cr. (I anno di Claudio), dove il mercante Serapion consiglia ad un suo amico Heraclides di Alessandria, che trovasi in ristrettezza di denaro, di guardarsi, come fanno tutti, dagli Ebrei, cioè di non chieder loro imprestiti, e di accordarsi piuttosto direttamente col suo creditore Ptollarion (5): ma è probabile che si tratti di una

With the money earned in trade, many Jews became bankers and we find them in every era: Flavius Josephus (3), for example, tells the anecdotal story of a certain Joseph, son of Tobias, who lived under Ptolemy V, a tenant farmer who became a rich banker; and reports (4) that the halbarca Alexander made a large payment in Alexandria, promising to complete it in Pozzuoli. The BGU papyrus appears to mention a Jewish banker. 1070 of 41 d. Cr.

We have no news of usury loans; it is true that there is a hint of it in a papyrus of unknown provenance, containing a letter dated 4 August 41 AD. Cr. (1st year of Claudius), where the merchant Serapion advises his friend Heraclides of Alexandria, who finds himself in a shortage of money, to beware, as everyone does, from the Jews, that is, not to ask them for loans, and to instead agree directly with his creditor Ptollarion (5): but it is probable that it is a

specie di rappresaglia momentanea verso gli Alessandrini, essendo avvenute da poco le note persecuzioni.

Le occupazioni intellettuali sono state sempre care agli Ebrei, e molti furono i dotti alessandrini (1). Tra i seguaci della cultura greca si ricordano il filosofo Aristobulo, maestro di Tolemeo Filometore (2), il poeta Ezechiele (3). Al tempo di Giovanni Ircano (II sec. av. Cr.), il maestro R. Josua ben Perachia emigrò da Gerusalemme ad Alessandria, e in seguito vi andarono pure Jehudà ben Tabbai e Šimon ben Šetach, i quali trovarono là ausilio e riparo contro le persecuzioni di Ircano (4); R. Josua ben Chanania, maestro del I secolo, si trattenne lungamente in Alessandria ed ebbe frequenti rapporti con dotti di quel tempo (5). Nel III secolo i maestri R. Jochanan e R. Šimon ben Lakiš vennero ricercati dagli Alessandrini per la spiegazione di alcune disposizioni della Legge (6). Il *Talmud* nomina ancora i dotti alessandrini R. Jochanan Hassandlar (7), scolaro di R. Akiba, e il proselite Miniamin, compagno di studî di R. Jehudà (8). Al Museo di Alessandria troviamo insegnante di medicina quell' Adamanzio scacciato con gli altri Ebrei da Cirillo nel 412 d. Cr., poi battezzatosi per poter rientrare nella città (9). Altro medico esercitante nello stesso luogo, sotto l' imperatore Zenone, è Domno, commentatore d'Ippocrate (10). Giustamente scrive il Bouché-Leclercq (11) che la Comunità ebraica di Alessandria « ..... ha esercitato sui destini dell' umanità una influenza, i cui effetti sono ancora presenti ».

a kind of temporary reprisal towards the Alexandrians, as the well-known persecutions had recently taken place.

Intellectual pursuits have always been dear to the Jews, and there were many Alexandrian scholars (1). Among the followers of Greek culture we remember the philosopher Aristobulus, teacher of Ptolemy Philometor (2), the poet Ezekiel (3).

At the time of John Hyrcanus (2nd century BC), the master R.
Josua ben Perachia emigrated from Jerusalem to Alexandria, and later Jehudà ben

Tabbai and Simon ben Setach also went there, who found help and shelter there

against the persecutions of Hyrcanus (4) ; R. Josua ben Chanania, a master of the

1st century, stayed for a long time in Alexandria and had frequent relationships with

scholars of that time (5). In the third century the masters R. Jochanan and R. Simon

ben LakiS were sought by the Alexandrians for the explanation of some provisions of the Law (6). The *Talmud* still names the Alexandrian scholars R. Jochanan

Hassandlar (7), pupil of R. Akiba, and the proselyte Miniamin, fellow student of R. Jehudà (8). At the Museum of Alexandria we find that Adamanzio, who was expelled with the other Jews by Cyril in 412 AD, was a teacher of medicine. Cr., then baptized to be able to return to the city (9). Another doctor practicing in the same place, under the emperor Zeno, is Domnos, commentator on Hippocrates (10). Bouché-Leclercq (11) rightly writes that the Jewish community of

Alexandria "flu, has exercised over the destinies of humanity the effects of which are still present".

Sotto i Tolemei gli Ebrei non dovettero essere molto benestanti, ma non mancano menzioni di grandi ricchezze possedute da certuni; così, Giuseppe Flavio (1) narra che a quei tempi un certo Arion fu in condizione di prestare 30.000 talenti. Grandi beni dovettero poi possedere molti appaltatori d'imposte, e questo, secondo il Wilcken (2), sarebbe provato dal fatto che le stesse persone seguitano a occupare quelle cariche per molti anni, certamente di loro volontà. Nei primi secoli dell'êra volgare anche gli alabarchi di Alessandria avevano spesso ricchezze ingenti, tanto che l'alabarca Alessandro prestò in una sol volta 200.000 dracme (3), ed egli stesso provvide a ricoprir d'oro e d'argento le porte del Tempio di Gerusalemme (4); e fu pure un alessandrino suo contemporaneo, Nicanore, che regalò per quel Tempio una porta di bronzo di Corinto a due battenti, che si dice fosse tanto pesante, da non poter essere mossa che da venti uomini (5). A lui si riferisce forse l'iscrizione trovata su di un ossuario presso Gerusalemme: Ὀστᾶ τῶν τοῦ Νεικάνορος Ἀλεξανδρέως ποιήσαντος τὰς θύρας ....נקנר אלכסא (6).

Troviamo anche in seguito Ebrei facoltosi, soprattutto fra gli armatori di Alessandria: « Molto ricco in oro, in argento, in servitori e in bestiame.... celebre dovunque per le sue rendite.... » era quel Filosseno alessandrino, ricordato da Cirillo (VI sec. d. Cr.) (7); ed egli stesso poco dopo dipinge al vivo l'invidia suscitata in due operai cristiani seduti nella via degli Ebrei, dalle ricchezze loro in oro e in argento.

Under the Ptolemies the Jews must not have been very wealthy, but there is no shortage of mention of great wealth -
chezz and owned by certain people; thus, Flavius Josephus (1) narrates that in those times a certain Arion was in a position to lend 30,000 talents. Many tax contractors must have owned large assets, and this, according to Wilcken (2), would be proven by the fact that the same people continued to occupy those positions for many years, certainly of their own volition. In the first centuries of the common era, even the alabarchs of Alexandria often had enormous wealth, so much so that Alexander the alabarch lent 200,000 drachmas at one time (3), and he himself covered the doors of the palace with gold and silver. Temple

of Jerusalem (4) ; and it was also a contemporary of his from Alexandria, Nicanor, who donated for that Temple a double-leaf bronze door from Corinth, which is said to be so heavy that it could only be moved by twenty men (5). Perhaps the inscription found on an Obuario at Jerusalem is reported to him : **'ÿÿÿÿ ÿÿÿ *riment ÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿilar***

....NDDSN

We also later find wealthy Jews, especially among the shipowners of Alexandria : "Very rich in gold, silver, servants and livestock... famous everywhere for his income..." was that Alexandrian Philoxenus, remembered by Cyril (6th century AD) (7) ; and shortly afterwards he himself vividly paints the envy aroused in two Christian workers sitting in the street of the Jews, by their wealth in gold and silver.

Ma se vi erano notevoli ricchezze, vi erano anche miserie non lievi, come rilevasi dai documenti che parlano di mutui e di dilazioni nel restituire il denaro ricevuto in prestito. Filone (1) incoraggiava gli Ebrei poveri di Alessandria, facendo loro sperare in un maggior lucro, se avessero osservato completamente le prescrizioni mosaiche.

Nel III sec. d. Cr. si richiedeva dalla legge l'*idonea facultas* per essere *navicularii,* di contro agli *inopes* alessandrini (2); e in istato di grande miseria — tanto che si augurava quasi la morte nel mare in tempesta per sfuggire ai suoi creditori, e aveva la nave in pessime condizioni — era quell'Amarantus alessandrino conduttore della nave sulla quale si trovava, verso il 400 d. Cr., Sinesio cirenaico, che narra in una sua lettera, in maniera molto divertente, questo avventuroso viaggio (3).

Da altri indizî si deduce ancora, indirettamente, che era numerosa la classe povera; avvenivano spesso distribuzioni gratuite mensili di grano, o elargizioni di denaro in occasioni eccezionali, alle quali partecipavano gli Ebrei, specialmente dove avevano il diritto di cittadinanza, come ad Alessandria; tuttavia non di rado ne vennero esclusi, forse per puro arbitrio di chi presiedeva alla distribuzione: così Apione (4) dice che l'ultima Cleopatra non li ammetteva alle distribuzioni gratuite di grano in Alessandria; e Giuseppe (5) racconta che la stessa esclusione effettuò Germanico nel 19: ma del resto qualunque distribuzione era stata proibita da Augusto per quella città.

D'altra parte, sappiamo che sotto Anastasio, essendo prefetto Eustazio (dopo il 505-6 d. Cr.), un ricco Ebreo, Urbib, fece delle distribuzioni di grano agli abitanti di Alessandria (6). E Filosseno, l'eroe del racconto leggendario nel sermone della penitenza attribuito a S. Cirillo, sopra citato (VI secolo d. Cr.), « era celebre in tutta la città per le sue rendite come per le sue elemosine » (7).

But if there were considerable riches, there were also mi - serious and not light, as can be seen from the documents that speak of mortgages and extensions in repaying the money
received on loan. Philo (1) encouraged the poor Jews of Alexandria, making them hope for greater profits if they completely observed

the Mosaic prescriptions.
In the **3rd** century d. Cr. the law required *the suitable facultas*

to be *navicularii,* as opposed to the Alexandrian *inopes* (2) ; and in a state of great poverty - so much so that he almost wished for death in the stormy sea to escape his creditors, and his ship was in terrible condition - he was that Alexandrian Amarantus, captain of the ship on which he was, around 400 AD. Cr., Cyrenaic Synesius, who narrates this adventurous journey in a very entertaining way in one of his letters (3).

From other evidence it can also be deduced, indirectly, that

the poor class was numerous ; there were often free monthly

distributions of grain, or donations of money on exceptional

occasions, in which the Jews participated, especially where they

had the right of citizenship, as in Alexandria; however, they were

often excluded, perhaps due to the pure will of those who presided

over the distribution: thus Apion (4) says that the last Cleopatra

did not admit them to the free distributions of grain in Alexandria ;

and Josephus (5) says that Germanicus made the same exclusion in 19 : but any distribution had been prohibited by Augustus for

that city.

On the other hand, we know that under Anastasius, Eustathius being prefect (after 505-6 AD), a rich Jew, Urbib, distributed grain to the inhabitants of Alexandria (6). And Philoxenus, the hero of the legendary story in the sermon of penance attributed to St. Cyril, cited above (6th century AD), « was famous throughout the city for his income as well as for his alms » (7) .

***

Quando gli Ebrei non erano, come ad Alessandria, ammessi completamente al godimento dei diritti comuni, si presentavano certo delle difficoltà non lievi nei procedimenti giudiziarî, per stabilire fino a qual punto potessero applicarsi le norme del diritto ebraico, e quando dovesse subentrare l'applicazione del diritto vigente nel territorio dove essi abitavano.

Così, sappiamo che le donne ebree dovevano presentarsi al tribunale accompagnate da un tutore: ciò forse in armonia con la legge locale, poiché non era richiesto da quella ebraica.

In un papiro che sembra del 226 av. Cr. (1) — e si tratta pertanto di uno degli esempî più antichi del nostro periodo — è esplicitamente detto che il processo per ingiurie che si svolge a Crocodilopolis (Arsinoite) davanti a un tribunale speciale (2) tra gli Ebrei Πέρσαι τῆς ἐπιγονῆς Dositeo (o Doroteo?) ed Eracleia col tutore (κύριος) Aristide Ἀθηναῖος τῆς ἐπιγονῆς, è condotto in parte secondo i διαγράμματα, cioè le leggi reali applicabili a chiunque in tutto l'Egitto, e in parte secondo i πολιτικοὶ νόμοι, come erano dette le leggi nazionali, o gli statuti di ciascun gruppo etnico, sociale o territoriale riconosciuto dal potere regio. È difficile poter stabilire se in questo caso il πολιτικὸς νόμος si riferisce al diritto ebraico o a quello derivante dalla condizione di Πέρσαι τῆς ἐπιγονῆς (3). Forse la causa si svolgeva in appello, perché la prima volta doveva essere stata discussa davanti a un tribunale ebraico: la donna si sarà appellata, dopo aver deposto un discorso scritto e

---

(1) PPetrie III, pp. 42-49.

(2) Tale processo fa parte dei molti « processi disertati » (ἔρημοι δίκαι) svoltisi davanti a 9 giudici sotto un presidente, formanti una commissione speciale, istituita, pare, per decidere su molte cause arretrate, dovute a dispute sorte tra militari appartenenti, per la maggior parte, alla classe τῆς ἐπιγονῆς (cfr. Bouché-Leclercq IV, p. 239).

(3) Questa espressione di Πέρσαι τῆς ἐπιγονῆς ha dato luogo a molte ipotesi: sembra oramai assodato che si chiamassero così i discendenti, nati in Egitto, dei primitivi coloni militari persiani; ma forse l'espressione non ha un valore tanto preciso, come alcuni ritengono, da indicare una determinata classe militare (cfr. Bouché-Leclercq IV, pp. 29-44; Wilcken, *Grundz.* I, p. 383; Schubart in *Archiv* V, p. 119; ecc.).

(44);

When the Jews were not, as in Alexandria, am -
placed completely in the enjoyment of common rights, considerable difficulties certainly arose in the proceedings -
ments of the judiciary, to establish to what extent the norms of Jewish law could be applied, and when the application of the law in force in the territory where they lived should take over.

Thus, we know that Jewish women had to appear at the court accompanied by a guardian: this perhaps in harmony with local law, since it was not required by Jewish law.

In a papyrus that appears to date from 226 BC. Cr. (1) - and it is therefore one of the oldest examples of our peri od - it is explicitly said that the trial for insults which takes place in Crocodilopolis (Arsinoite) before a special tribunal (2) among the Jews ***ÿÿÿÿÿÿÿ***

ÿÿÿ ÿÿÿÿÿÿÿÿÿ Dositheus (ÿ Dorotheus?) and Heracleia with the guardian ***{ÿÿÿÿÿÿÿ)*** Aristides ***'ÿÿÿÿÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿÿ,*** is conducted partly according to the ÿÿÿÿÿÿÿÿÿÿÿÿÿ, i.e. the applicable real laws to anyone in all Egypt, and partly according to the ***ÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿ,***

as they were called the national laws, or the statutes of each ethnic,

social or territorial group recognized by the royal power. It is difficult

to establish whether in this case the ***ÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿ*** refers to

Jewish law or to that deriving from the condition of ***ÿÿÿÿÿÿÿ ÿÿÿ***

ÿÿÿÿÿÿÿÿÿ (3). Perhaps the case took place on appeal, because the

first time it must have been discussed before a Jewish court: the woman must have appealed, after having given a written speech and

(1) PPetrie III, pp. 42-49.

(2) This trial is part of the many "defected trials" (ÿÿÿÿÿÿÿ ÿÿÿÿÿ) held before 9 judges under a president, forming a special commission, established, it seems, to decide on many backlogged cases, due to disputes arising between military members, for the most part, to the class ÿÿÿ ÿÿÿÿÿÿÿÿÿ (see BOUCHE-LECLERCQ IV, p. 239).

(3) This expression of ÿÿ'ÿÿÿÿÿ ÿÿÿ ÿÿÿÿÿÿÿÿÿ has given rise to many hypotheses: it now seems well established that the descendants, born in Egypt, of the primitive Persian military colonists were called this; but perhaps the expression does not have such a precise value, as some believe, to indicate a specific military class (see BOUCHE- LECLERCQ IV, pp. 29-44; WILCKEN, *Grundz.* I, p. 383; SCHUBART in *Archiv* V, p. 119; etc.).

delle giustificazioni se così leggesi il testo frammentario del papiro non consentite dalla legge mosaica.

Probabilmente, dove esisteva, come ci attesta Strabone (1) per Alessandria, un tribunale ebraico presieduto dall'etnarca, spettava a questo di giudicare quando si trattava di soli Ebrei, e venivano subito eseguite le sentenze, senza che, forse, se ne ingerissero le autorità locali; ma quando non v'era un tribunale ebraico, o si trattava di questioni tra Ebrei e non Ebrei, era competente il tribunale locale, completamente o in parte.

Anche nell'applicazione delle pene vi era diversità a seconda dei casi, e la cittadinanza posseduta v'influiva molto; così, mentre nel periodo romano a un Ebreo semplice pellegrino venivano applicate le pene comuni, a quelli che erano cittadini romani venivano estese tutte le attenuanti dovute loro a seconda della condizione sociale, ecc., come ai Romani stessi; e a quelli che erano cittadini greci alessandrini furono mantenute le distinzioni privilegiate di cui godevano anche in tale materia: essi, ad esempio, non potevano venir bastonati (lo furono, per eccezione, durante le persecuzioni di Flacco), come gli altri Alessandrini, ma erano colpiti con la verga prescritta dall'apposito funzionario della città (2).

***

Non abbiamo notizie particolari riguardo al matrimonio: sappiamo soltanto che anche in Egitto gli Ebrei davano molta importanza al fidanzamento, atto decisamente impegnativo, tanto che ad Alessandria il contratto di matrimonio veniva redatto anticipatamente, a volte in greco (3), in quella occasione (4).

Non dovevano essere rari i matrimoni tra Ebrei e non Ebrei, dato che Filone (5) biasima acerbamente tale uso, proibito dalla legge ebraica.

---

Probably, where there existed, as Strabo (1) attests to us in Alexandria, a Jewish tribunal presided over by the ethnarch, it was
up to him to judge when only Jews were involved, and the sentences were immediately carried out, without, perhaps, any interference local authorities ; but when there was no Jewish court, or matters between Jews and non-Jews were involved, the local court was competent, completely or in part.

Even in the application of penalties there was diversity depending

on the case, and the citizenship held had a great influence; thus,

while in the Roman period the common penalties were applied to a

simple pilgrim Jew, all the extenuating circumstances due to them depending on their social condition, etc. were extended to those who

were Roman citizens, as well as to the Romans themselves ; and those who were Greek citizens of Alexandria were maintained the privileged distinctions that they also enjoyed in this matter: they, for example, could not be beaten (they were, by exception, during the persecutions of Fiacchus), like the other Alexandrians, but were hit with the rod prescribed by the appropriate city official (2).

We have no particular information regarding the mother -
monio: we only know that even in Egypt the Jews gave great importance to the engagement, a decidedly demanding act, so much so that in Alexandria the marriage contract was drawn up in advance, sometimes in Greek (3), on that occasion (4).

Marriages between Jews and non-Jews must not have been

rare, given that Philo (5) bitterly condemns this practice, which is prohibited by Jewish law.

(1) At FLAV. JOS., *Atiliqu.,* 14, 7,2, § 117. Perhaps it could also be that the ethnarch was the head of the judicial power of the Jews of Egypt, not of a single court: cf. JUSTER LI, p. ILI, ÿ. 1.

of justifications if the fragmentary text of the papyrus is read in this way, not permitted by the Mosaic law.

***

Di conversioni al paganesimo o al cristianesimo abbiamo alcuni esempî: così troviamo (circa nel 295 d. Cr.) un certo Giacobbe figlio di Achille (1), custode di un tempio egiziano, il cui nome mostra chiaramente la sua origine. In un litigio concernente una eredità, sono nominati due Cristiani, David ed Elisabetta, i quali dovevano essere originariamente Ebrei, a giudicare dai loro nomi biblici (2); e antichi manoscritti arabi parlano di una conversione degli Ebrei abitanti a Tomei presso Henef nel 622 d. Cr. (3).

Esempî di conversioni forzate si hanno ad Alessandria dopo l'espulsione ordinata da Cirillo nel 414 d. Cr., con l'interdizione di rientrare nella città senza il battesimo; ad esso si sottopose, ad es., Adamanzio, il celebre medico alessandrino (4).

***

Dal *Talmud* (5) si apprende che vi erano casi di prostituzione di donne ebree ad Alessandria, ma nessun'altra testimonianza sicura è stata trovata, poiché non sembra abbia gran valore l'ipotesi del Clermont-Ganneau (6), che fossero cortigiane le donne nominate in due iscrizioni di Alessandria, Ἰωάννα Εὐφροσύνη e Σιμοτέρα Ἡλιοδώρου Σιδωνία, perché l'ipotesi si baserebbe solo sulla natura dei nomi: Σιμοτέρα sarebbe il comparativo dell'aggettivo σιμή, *camusa*, (per analogia con Φιλωτέρα da Φίλη, nome messo alla moda dalla sorella di Tolemeo II), e l'altro nome non era in fama troppo buona; ma non mancano invero esempî di donne oneste così chiamate.

***

Poche parole dirò infine, in generale, sui nomi portati dagli Ebrei in Egitto.

(46)

We have some examples of conversions to paganism or Christianity: thus we find (around 295 AD) a certain Jacob, son of Achilles (1), guardian of an Egyptian temple, whose name clearly shows his origin. In a dispute concerning an inheritance, two

Christians are named, David and Elizabeth, who must have been originally Jews, judging by their biblical names (2) ; and ancient Arabic manuscripts speak of a conversion of the Jewish inhabitants of Tornei near Henef in 622 AD. Cr. (3).

Examples of forced conversions occur in Alexandria after the expulsion ordered by Cyril in 414 AD. Cr., with the interdiction to re-enter the city without baptism; for example, Adamantius, the famous Alexandrian doctor, underwent it (4).

From the *Talmud* (5) we learn that there were cases of pro - establishment of Jewish women in Alexandria, but no other certain evidence has been found, since Clermont-Ganneau's hypothesis (6) that the women named in two Alexandria inscriptions, ' **ÿÿÿÿÿÿ *ÿÿÿÿÿÿÿÿÿ ,*** were courtesans, does not seem to have much value and ***ÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿÿÿ ÿÿÿÿÿÿÿÿ,*** because the hypothesis would be based only on the nature of the names : ***ÿÿÿÿÿÿÿÿÿ*** would be the comparative of the adjective ***ÿÿÿÿ,*** *camusa,* (by analogy with ***ÿÿÿÿÿÿÿÿÿ*** from ***ÿÿÿÿ,*** a name put into fashion by the sister of

Ptolemy **II),** e the other name was not too well known ; but there is indeed no shortage of examples of honest women so called.

Finally, I will say a few words in general about the names given by the Jews in Egypt.

Se uno studio sulla natura del nome è utile sempre, e in particolare per gli Ebrei, riflettendosi in esso le peculiari condizioni di esistenza in mezzo ai diversi popoli (1), tale studio si rende quasi indispensabile nel nostro campo, dove spesso un documento può riferirsi sicuramente a Ebrei dai nomi contenutivi, senza altri indizî; e d'altra parte sono di tante specie quelli usati, da indurre facilmente, qualora non si proceda con grande cautela, a conclusioni false.

Anzitutto va notato che ognuno aveva un nome ebraico, generalmente biblico; spesso poi ne adottava un altro usato in Egitto, anche uno teoforo pagano o persiano o egiziano o greco, combinato a volte con uno romano (2).

Al tempo romano, per adottare un nome gli Ebrei dovevano chiedere l'autorizzazione al funzionario addetto, l'*idiologo*. A volte veniva prescelto il nome di colui che aveva accordato la cittadinanza romana: così, nella famiglia di Filone, che l'aveva ottenuta da *Tiberio* o da *Nerone,* fu adottato quello di *Tiberio Giulio.*

Altre volte lo stesso nome ebraico era latinizzato o grecizzato, come Θεόδοτος (3) (che ricorre spesso in papiri e in iscrizioni) da *Nathan;* talora era invece cambiato in uno equivalente greco, in modo puramente arbitrario; per esempio, nell'Arsinoite, intorno al III sec. av. Cr., si ha il testamento di un certo Filone, figlio di Eraclide, che lascia dei legati a sua moglie, a sua figlia e anche ai suoi schiavi, fra i quali, sembra, è un Ebreo che si chiama Gionata in ebraico e Apollonio in greco: Ἀπολλ[ώνιον ?] παρεπίδημον ὃς καὶ Συριστὶ (4)

(1) Vedi le interessanti considerazioni sul nome, applicabili per qualunque paese della diaspora, svolte dal CASSUTO nell'opera *Gli Ebrei a Firenze nell'età del Rinascimento* (Firenze (1918) pp. 231 e segg.).

(2) Esempio di nome ebraico-romano: Ἰουλιάνου Εἴσαχ Αββίβου (*C.-R. Ac. Inscr.* (1905) p. 157; CLERMONT-GANNEAU, *Rev. Arch. Or.* VII, p. 159); di nome egizio-romano: Βήσας Νόνου (CLERMONT-GANNEAU, *Archaeol. res.* II, p. 145); di nome greco teoforo: Πτολεμαῖος Διονυσίου (*C. I. G.* 4838 *c*). Buoni elenchi, più o meno completi, di nomi ritenuti ebraici ricorrenti in documenti egiziani del nostro periodo, trovansi in SCHÜRER III, p. 45; *Archiv* III, p. 171, e V, p. 119; WESSELY, *Stud. Pal.* XIII, pp. 8-10; ACCORDI in *Studî Sc. Papir. Mil.* III (1920) pp. 28-29.

(3) Molto frequenti sono tra gli Ebrei i nomi con Θεός.

If a study on the nature of the name is always useful, and in particular for the Jews, as the peculiar conditions of existence among different peoples are reflected in it (1), such a study becomes almost indispensable in our field, where often a document can certainly refer to Jews by the names contained therein, without other clues; and on the other hand, those used are of so many kinds that they easily lead to false conclusions, if one does not proceed with great caution.

First of all it should be noted that each had a Hebrew name, generally biblical ; he then often adopted another one used in Egypt*, even a pagan or Persian or Egyptian or Greek theophorus, sometimes combined with a Roman one (2).

In Roman times, to adopt a name the Jews had to ask for authorization from the official in charge, *Yidiologo.* Sometimes the name of the person who had granted Roman citizenship was chosen: thus, in the family of Philo, who had obtained it from *Tiberius* or *Nero,* that of *Tiberius Julius was adopted.*

Other times the same Hebrew name was Latinized or Greekized, such as ***ÿÿÿÿÿÿÿÿ*** (3) (which often occurs in papyri and inscriptions) by *Nathan;* sometimes it was instead changed to a Greek equivalent, in a purely arbitrary way; for example, in

Arsinoite, around the 3rd century. av. Cr., we have the will of a certain Philo, son of Heraclides, who leaves legacies to his wife, his daughter and also to his slaves, among whom, it seems, is a Jew called Jonathan in Hebrew and Apol -lonium in Greek : ***ÿÿ·ÿÿÿ[ÿÿÿÿÿ ?] ÿÿÿÿÿÿÿÿÿ» ÿÿ ÿÿÿ ÿÿÿÿÿÿÿ*** (4)

(1) See the interesting considerations on the name, applicable for any country of the diaspora, carried out by CASSUTO in the work *Gli Ebrei a Firenze nell'età del Rinascimento* (Florence (1918) pp. 231 and following).

(2) Esempio di nome ebraico-romano: Ioulianou, Eisak Avvivou *{C.-R.*
***Ac. Inscr.* (1905) p. 157; CLERMONT-GANNEAU, *Rev. Arch. Or.* VII, p. 159); di nome Egyptian-**

Roman : ÿÿÿÿÿ ÿÿÿÿÿ (CLERMONT-GANNEAU, *Archaeol. res.*
II, p. 145); di nome greco teoforo: Ptolemy of Dionysius (C. */. G.* 4838 *c).*
Good lists, more or less complete, of names believed to be Jewish recurring in Egyptian documents of our period, can be found in SCHÎIRER III, p. 45;
***Archiv* III, p. 171 e V , p . 11 9; WBSSELY, *Stud. Father* XIII, pp. 8-10; Agreed**
and *Study. Paper. Mil.* OR (1920) pp. 28-29.

(3) Names with ÿÿÿÿ'ÿ are very frequent among Jews.

(4) Regarding this expression, see above where I speak of the Jews in the

Village of the Syrians.

Ἰωνάθας [καλεῖται] (1); tale uso era naturalmente biasimato dai talmudisti.

L'aggiunta quasi costante della parola Ἰουδαῖος si rileva già nei documenti più antichi, ed era necessaria ad evitare confusione per possibili omonimie con non Ebrei. Ἑβρεῖος(-αῖος) ricorre solamente tardi, dal VI secolo d. Cr. in poi, e ne abbiamo esempî per l'Arsinoite (2) e per il Fayum (3); tanto più necessarie erano tali aggiunte, dato che anche i gentili avevano spesso nomi ebraici, e che molti nomi non ebraici erano simili a quelli veramente tali. Così Σίμων (4) può derivare dal greco σιμός; e Ἴσας, oltre che da Ἴσακ, può venire da *Iside* (5).

***

Con le notizie raccolte si può ricostruire, come abbiamo veduto, pressoché ogni aspetto della vita che gli Ebrei conducevano in Egitto nell'età ellenistica e romana; e poiché, nell'odierno fervore di ricerche che compiono le varie nazioni in nobile gara, vengono continuamente alla luce nuovi documenti — già mentre scrivo queste righe, molto probabilmente si stanno scoprendo e delucidando nuovi testi, dai quali potranno esser tratte altre notizie — non è certo avventato l'affermare che fra qualche tempo sarà possibile di ricostruire sicuramente nella sua interezza la vita pubblica e privata, così intensa, così multiforme, degli Ebrei d'Egitto.

Iona'5-as [called] (1) ; tale uso era naturalmente biasimato dai talmudisti.

(48);

The almost constant addition of the word ÿÿ ÿ ÿ ÿ ÿÿ ÿ can already be found in the most ancient documents, and was necessary to avoid confusion due to possible homonyms with non-Jews. it ***ÿÿÿÿÿÿÿ{-*** occurs only late, from the 6th century AD. Cr. ***ÿÿÿÿ)*** onwards, and we have examples for Arsinoite (2) and for Fayum (3) ; Such additions were all the more necessary, given that

Gentiles also often had Jewish names, and that many non-Jewish names were similar to the truly Jewish ones. Thus ***ÿÿÿÿÿ*** **(4)** can

n
derive from the Greek ***ÿÿÿÿÿ;*** and **ÿÿÿÿ,** as well as from

n**ÿÿÿÿ,** can come from *Isis* (5).

With the information collected it is possible to reconstruct, as we

have seen, almost every aspect of the life that the Jews led in Egypt

in the Hellenistic and Roman ages; and since, in today's fervor of

research carried out by the various nations in noble competition, new

documents continually come to light - even as I write these lines,

new texts are most likely being discovered and elucidated, from which

they can be drawn other news - it is certainly not rash to state that in some time it will be possible to certainly reconstruct in its entirety the

public and private life, so intense, so multifaceted, of the Jews of Egypt.

A Semitic origin of some runes

An influential foreign presence in Denmark c. AD 200

By John Troeng

Troeng, J. 2003. A Semitic origin of some runes. An influential foreign presence in Denmark c. AD 200. (Ett semitiskt ursprung till vissa runor. Inflytelserika främlingar i Danmark ca 200 e.Kr.) *Fornvännen* 98. Stockholm.

Though most Germanic runes probably derive from Latin letters, some of them cannot be convincingly derived from that source. At least five runes are better explained as originating from letters of the Nabatean variety of the Aramaic Semitic alphabet. The Nabatean kingdom comprised approximately present-day Jordan and the Sinai, was occupied by the Romans in AD 106 and then became the province of Roman Arabia. A thousand archers recruited from Roman Arabia were stationed on the *limes* at Straubing in Bavaria in about AD 125–200. Professional soldiers from the Roman army appeared in Denmark about AD 200 and thoroughly reorganised the society. The earliest runic inscriptions date to about AD 200 and were closely connected with the professional soldiers. These probably included archers from Straubing.

John Troeng, Gesällgatan 7, SE-227 36 Lund, Sweden
john.troeng@telia.com

Introduction

The runic alphabet, the *futhark*, was used in most Germanic areas. The earliest clearly runic inscriptions are mainly from Denmark and date to the first half of the 3rd century AD, though one of them may be from c. AD 160. About AD 750 the *futhark* was thoroughly revised, and this paper will refer only to the older *futhark* when it says runes, runic alphabet etc.

No runological problem is as controversial as the origin of the *futhark* (Odenstedt 1990, p. 146). Attempts have been made to derive it from the Latin, Greek and North Italian alphabets. None of these can explain the forms and sound values of all the runes satisfactorily. Any assumption of more than the slightest development of runic form (such as inversion or slanting of a horizontal line) from mother letter to posited runic heir opens up a floodgate of possibilities and should not be accepted (Williams 1995, p. 189–190). The same strictness is desirable also regarding the sound values of the runes.

The letters of the archaic Greek script are more similar to runes than are the Greek letters of the 2nd century AD (Morris 1988, p. 151–154). The time gap of some 500–700 years to the earliest runic inscription, however, makes this comparison anachronistic and untenable (Odenstedt 1991). There is also a long geographical distance between the Germanic areas and the areas of the archaic Greek script.

Some runes are identical in form and sound

value to letters found in one or another of the alphabets that were used in North Italy before the area was Romanised (Marstrander 1928, p. 87). Among these, the Sondrio and Lugano alphabets have the greatest number of letters similar to runes, but the model alphabet of the *futhark* must have been more Romanised than any of these alphabets (Hammarström 1930). For an alphabet in North Italy to have become further Romanised, it would have required a strong Roman presence in the area. This would have made it unlikely that one of the subjugated local tribes could have provided the model of the *futhark* (Odenstedt 1990, p. 150). There is also a geographical gap between the North Italian inscriptions south of the Alps and the Germanic peoples north of the Danube, and an even wider gap between the North Italian inscriptions and the area of the earliest runic inscriptions.

The North Italian theory has been revived and underpinned by an attempt to explain the *futhark* sequence by manipulations of a 26-letter long proto-Tyrrhenian or North-Etruscan alphabet from the 7th century BC (Seebold 1986, p. 541–548; 1993; Mees 2000). These manipulations include removal of two letters from the original alphabet, change of the sound values of some letters, change of the forms of some letters, pairing of runes, and reordering of the pairs of runes. The pairing of the runes follows a freely invented and rather arbitrary scheme that is very different from the regular Atbash scheme referred to. The reorganisation of the sequence of rune-pairs follows another specially invented scheme that is similarly unwarranted and not as regular as claimed. Such a sequence of *ad hoc* manipulations proves nothing. Calculations would be needed to prove that the manipulations have a significant degree of regularity.

The theories of an exclusively Latin origin of the *futhark* usually presume that some Scandinavian merchant or soldier went to the Roman Empire, learnt the Latin script, invented a new script, and introduced reading and writing on arrival back home (Moltke 1976, p. 57–58, Rüger 1998). Romans who came to Germanic areas would hardly have created a new script but would rather have used the Latin one.

There are two major objections to the idea that a Scandinavian brought the script to Scandinavia. Firstly, scripts are generally not dispersed in this way. Barbarian merchants and soldiers were in close contact with the Egyptian and Chinese civilisations for centuries and millennia without ever establishing reading and writing in their own countries. Africans and American Indians whose contacts with European civilisation were limited to trade with travel ling merchants never modified the European scripts for their own needs. The art of reading and writing was efficiently dispersed only when those who were literate since childhood settled in new areas as merchants, colonialists or missionaries. The well known Cherokee script was developed in Georgia only in the 19th century, when Georgia was a state led by Americans of European descent. The Easter Island *rongorongo* was invented without European settlement on the island. It is, however, not a true script but only a graphic representation of a highly limited corpus of rhetorical statements (Fischer 2003, p. 290–291).

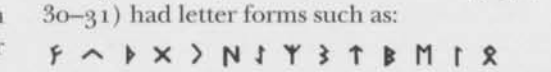
Secondly, there is no indication of Scandinavian soldiers in the Roman army before the runic script had appeared in Scandinavia. Arminius, of the Germanic *Cherusci* tribe between the Weser and the Elbe, was trained in the Roman army only because the *Cherusci* had been subjugated to the Romans. After having been defeated at Kalkriese by Arminius' coalition of Germanic tribes in AD 9, the Roman army did not venture into Germanic areas much beyond the Rhine and shun from employing Germanic soldiers for a long time. Men of Germanic descent were recruited as soldiers to the auxiliary troops of the Roman army already in the 2nd century AD, but these Germanic soldiers came from tribes settled in the Roman provinces and had to be Romanised before being recruited (Alföldy 1968, p. 136–163). *Vita Marci* states that gladiators, mountain tribes in Dalmatia, Greek country constables, and Germanic soldiers were recruited to the army during the Marcomannic wars, AD 166–180 (Lennartz 1969, p. 161). Because the Germanic soldiers

are mentioned in this context they seem to have been rather few. There were deserters from the *Marcomanni*, the *Quadi*, and perhaps other Germanic tribes participating in the Marcomannic wars (ibid., p. 190), and the Germanic soldiers may have been recruited from this group. Soldiers recruited from these tribes would probably not have settled in Scandinavia after having served in the Roman army. Scandinavians who knew neither the local tongue nor Latin, the language of command, would not have been recruited even if they had, somehow, travelled through the territories of different German tribes to reach the *limes*. The *vexillationes* units that were introduced by the end of the 2nd century could also be recruited from client tribes in the border area (Schutz 1985, p. 26–27). Because there is no evidence of client tribes in Scandinavia, it is very unlikely that any Scandinavian soldiers had served in the Roman army when the runes appeared in Scandinavia at the beginning of the 3rd century AD.

It may be concluded that the many attempts to derive the runic alphabet from the Latin, Greek, and North Italian alphabets have not been successful. It may therefore be asked what other alphabets might have been the model of the runic alphabet. Iberia had its own alphabets but they were never used near any Germanic area and are not attested to have been used after the 1st century BC. Because no further alphabet is known to have been used by any European people in Roman times, an alternative model of the runic alphabet has to be sought outside Europe.

Roman army auxiliaries from Africa and Asia who were stationed on the *limes* in Europe in the 2nd century AD are presumably the only people who may have provided a non-European model for the runic script. There were auxiliaries from the provinces of Mauretania, Africa proconsularis, Syria, and Roman Arabia on the *limes* in Europe (Stein 1932). They may all have used Semitic scripts.

Morris (1988, p. 157) found that the appearance of the runes suggests that they could derive from some Semitic alphabet. An Aramaic Semitic script was the model of the Turkish runic alphabet in Central Asia (Haussig 1985, p. 81–85). This alphabet (V. Thomsen 1919, p. 30–31) had letter forms such as:



These letters were probably not related to the Germanic runes, but they indicate that rune-like forms may have developed from the much more rounded forms of Aramaic letters.

Non-representation of double letters, writing of words without spacing, and variable direction of writing in early runic inscriptions are features that were advanced as arguments for the Greek theory vs. the Latin theory (Morris 1988, p. 125–139). In defence of the Latin theory these features were explained as independently invented for the runic script or as a result of the runic script being primitive (Odenstedt 1991, p. 383–384). Recourse to such *ad hoc* explanations is not necessary to escape acceptance of the Greek theory. Double letters are not represented in the Nabatean Aramaic script (Cantineau 1930, p. 37). Consecutive writing is normal in the Nabatean script and other Semitic scripts. Most Semitic scripts are written from right to left. The variable direction of writing in early runic inscriptions could perhaps be explained by the runic script being based on two scripts with different directions of writing. Three features of the runic script that were forwarded as arguments for the Greek theory may thus instead be used as arguments for a Semitic theory.

The runic alphabet is the only European alphabet known to have had meaningful letter names such as the Semitic alphabets have. The name of the first rune, *fehu* "cattle", and the name of the first Semitic letter, *alef* "ox", have practically the same meaning (Rasmussen 1990, p. 121). This supports the idea that a Semitic alphabet was at least one of the models of the runic alphabet.

It would not be unique for the runic alphabet to be based on more than one alphabet. The Iberian type of alphabet that emerged in 800–500 BC was based on both the Phoenician alphabet and the Greek alphabet (Untermann 1987). The first alphabet for a Slavonic language, the Glagolithic alphabet from the 9th century AD, had Semitic letters, Greek letters, and Christian symbols as models (*Nationalencyklo-*

pedin 1992:7, p. 498). Though the Iberian and Glagolithic alphabets were based both on Semitic and Greek alphabets, there is no evidence that a mixed Semitic-Greek alphabet ever existed.

Among the leading Semitic alphabets used in the first centuries AD there were the Jewish (Hebrew) script used by the Jewish diaspora and the Nabatean Aramaic script used in Roman Arabia, approximately the area of modern Jordan and the Sinai (Hooker 1996, p. 236–242). The Nabatean script has been seen as a forerunner of the Arabic script (ibid., p. 246). Runes difficult to explain from Latin letters appear more similar to Nabatean letters than to other Semitic letters.

Nabatean models of some runes

Most runes have their forms and sound values well explained by Latin letters (table 1). The arguments for the derivation of the runes from Latin capitals have most recently been elaborated by Odenstedt (1990) and Williams (1996). The inventor of the runes may have been more likely, however, to have been confronted with the cursive Latin writing of e.g. graffiti and military diplomas than the Latin capitals displayed on stone monuments (Quak 1996, p. 172). The Latin cursives ᚨ *a*, ᚺ *h*, ᚾ *n*, ᛊ *s*, ᛚ *l*, and ᛟ *o* from the first two centuries (Thompson 1912, p. 335–337) may explain better than Latin capitals the forms of the runes. The sound value of runic ᛇ is contested but usually thought to be i. No Latin capital can explain the combination of form and sound value of runic ᛇ i, but *cursive Latin* Z *y* can do it. Nevertheless, some runes are best derived from Latin capitals, e.g. the problematic runic ᛜ is best derived from Latin Q *q* which is close in both form and sound value.

The runes, ᚷ *g* / 3, ᚹ *w*, ᛄ *j*, ᛈ *p*, ᛉ *z*, ᛖ *e*, ᛞ ð have been difficult to explain by derivation from Latin letters.

Runic ᚦ θ has usually been thought to derive from Latin D *d* but neither the forms nor the sound values are quite similar. It is also strange that the ᚦ-rune and not the *d*-rune would have the form of Latin D. Nabatean 𐢦 t^{s} (Hooker 1996, p. 248) better explains that runic ᚦ has a stem that reaches above and below its pocket. It also better explains that ᚦ represents a voiceless dental consonant.

Runic ᚹ *w* and ᛉ *z* were proposed to have been modelled on Latin P and Y, but there was no good explanation for their sound values (Odenstedt 1990, p. 163–166; Williams 1996, p. 215–216). Nabatean ᚹ *w* and 𐢩 *ʃ* (Hooker 1996, p. 247) instead may well explain the forms and –sound values of runic ᚹ *w* and ᛉ *z*. It has been presupposed that the original runic forms were angular such as ᚠ *w* (Odenstedt 1990 p. 159), but this assumption is not warranted (Williams 1992, p. 200–201; Barnes 1994, p. 17–18; Odenstedt personal communication).

The *g*-rune, ᛪ , has the form of Latin X *ks* but seems to have denoted *g* (e.g. Williams 1996, p. 214) or 3 (e.g. Odenstedt 1990 p. 160–167). Nabatean 𐢤 seems to have denoted both *g* and ϒ (Cantineau 1930 p. 39; Hooker 1996 p. 247). It has a sound value similar to the *g*-rune and may have developed into the *g*-rune's form when inscribed in e.g. wood.

Runic ᛄ *j* has been proposed to derive from capital Latin G *g* (Odenstedt 1990 p. 160, 165; Williams 1996:), but 2nd-century cursive Latin ʃ *g* is more similar in form to the *j*-rune. The difference in sound value between the rune and the proposed Latin model letter is remarkable, however. In the Latin script the *j*-sound was denoted by I *i*, and it is unclear why this letter was not used to denote the *j*-sound, had the *j*-rune been derived from the Latin script (Odenstedt 1990 p. 65). Nabatean 𐢥 *j*, *i* (Hooker 1997, p. 248) provides the best explanation of the combination of form and sound value that constitutes the *j*-rune.

Runic ᛈ *p* has usually been seen as a coinage, but has also been derived from Latin B *b* or K *k* (Odenstedt 1990, p. 160, 166; Williams 1996, p. 214). Cursive Latin ⊏ *p* (Prou 1910, p. 58) is closer in both form and sound value. Nabatean 𐢪 *p*, *f* (Cantineau 1930, p. 30, 38; al-Theeb 1993, p. 177) is also more similar in form and sound value to runic ᛈ *p*.

Runic ᛖ or ᛗ *e* has usually been thought to derive from capital Latin E (Odenstedt 1990, p. 97–101). This derivation is based on questionable theories about why the form

Latin letters			Nabatean letters		Runic alphabet	
Capital	Cursive	Sound value	Form	Sound value	Form	Sound value

Table 1. Latin letters, Nabatean letters, and the runic alphabet —Latinska bokstäver, nabateiska bokstäver och runalfabetet

would have changed. Runic ᛖ *e* has alternatively and without proper regard to its sound value been derived from Latin M *m* (Williams 1996, p. 214–216). Cursive Latin \\ *e* (Thompson 1912, p. 335) is close to the *e*-rune in both form and sound value. Nabatean 𐢇 (Naveh 1982, p. 137) is almost identical in form to the *e*-rune. In the consonantal Nabatean script it represented primarily *h* but was also used for representation of *e* and *a* (Cantineau 1930, p. 46–47). It seems more likely, however, that runic ᛖ e derives from a letter that primarily represented the *e*-sound and at the same time was close in form to the *e*-rune, i.e. from cursive Latin \\ *e*.

Runic ᛚ *l* has usually been derived from Latin L *l*. Nabatean 𐢆 *l* (Naveh 1982, p. 156) is somewhat closer in form and may instead have been the model of the *l*-rune.

Runic ᛞ ð has usually been seen as a coinage, possibly from doubling of runic ᚦ θ or Latin D *d* (Odenstedt 1990, p. 160–164; Williams 1996, p. 216). This derivation also requires an explanation why the resulting rune was not ᚦᚦ. No Latin or Nabatean letter can satisfactorily explain the form of runic ᛞ ð.

Latin M has usually been seen as the sole model of runic ᛗ *m* (Odenstedt 1990, p. 160–167). If also Nabatean 𐢌 *m* (Cantineau 1930, p. 29) influenced the form of runic ᛗ *m*, this form is better explained.

Since most runes derive from Latin letters, it may be asked why not all runes had Latin model letters. Only for the ᚦ-, *w*-, and *j*-runes and perhaps for the *g*-rune can the use of Nabatean models be explained by there being no Latin letters with the proper sound values.

Nabatean letters may have been used as models of *þ*- and *z*-runes and perhaps the *m*-rune because the (capital) Latin letters of these runes were too similar in form to other runes. If the sound value of runic ᛈ *þ* had been denoted by capital Latin P *þ* this rune would have become almost identical to runic ᚹ *w*. The cursive of this Latin letter or a Nabatean letter may therefore have been used instead. If Latin Z had denoted the *z*-sound this rune would have become too close in form to runic ᛁ i (?). Because Latin M *m* was very similar to runic ᛗ *e*, a different form may have been needed to denote the *m*-sound.

It is more difficult to say why Nabatean models would have been chosen for runic 𐢇 *e* and ᛚ *l*. Because horizontal lines were avoided in runes (Odenstedt 1990, p. 158), Latin E *e* may have been less suitable to denote the *e*-sound than Nabatean 𐢇 *h, a, e*. The horizontal arm of Latin L *l* may similarly have made this letter less suitable than Nabatean 𐢆 *l*.

Forms and sound values thus indicate that some runes probably derive from Nabatean model letters. It must then be asked how letters of the Nabatean alphabet used in Roman Arabia may have become models of certain runes in northern Europe. Only people of Nabatean descent are likely to have known the Nabatean letters well enough to use them for an alphabet.

Nabateans on the limes at Straubing in Bavaria

The wealth of the Nabateans was based on control of the long-distance trade between Mesopotamia and Egypt and between South Arabia and the Mediterranean coast, as well as on participation in the lucrative Mediterranean trade (Glueck 1966, p. 346). Nabatean inscriptions in Europe have been found in the Greek archipelago, at Puteoli near Naples, and in Rome (Wenning 1987, p. 22–23). After AD 106, when the Romans had turned the Nabatean kingdom into a province called Roman Arabia, soldiers of Nabatean origin began to be recruited into the Roman army (Bowersock 1983, p. 76, 107–108). Two cohorts recruited there were stationed on the *limes* in Germany (Walke 1965, p. 55–56). The cohort that will turn out to be of particular interest is described below.

The *Canatha* cohort of 1,000 archers was recruited from Hauran in Roman Arabia and came to Straubing (*Sorviodurum*) in Bavaria some time in AD 121–128 (Walke 1965, p. 55–56, 83–87). *Canatha* (modern El-Qanawat) was only 40 kilometres north of Bostra, the provincial capital of Roman Arabia (Bowersock 1983, p. 101–106). Though *Canatha* was not actually located in Roman Arabia at that time but a few kilometres north of the border with Syria (Bowersock 1983, p. 66, 103, 114–115), the *Canatha* cohort was probably mainly of Nabatean ori-

gin. When the cohort was in Bavaria, it probably received a continuing flow of recruits from Roman Arabia (Keppie 1984, p. 185). Military diplomas indicate that the *Canatha* cohort was still at Straubing in AD 166, but such diplomas are lacking from later periods (Stein 1932, p. 80, 286; Kellner 1971, p. 67).

Crafts were well developed at Straubing. Many woodworking tools such as iron saws, iron chisels, an iron wedge, and an iron plane have been found in the remains of the fort there (Keim and Klumbach 1951, p. 37–40). There was an unusual amount of bronze casting taking place for an auxiliary vicus (Walke 1965, p. 86).

Nearly one hundred bone and iron pencils (*stili*) and almost as many graffiti on pottery found at Straubing indicate unusually intensive writing for an auxiliary camp (Walke 1965, p. 58). The pencils usually had a pointed end for writing in wax and an opposite broad end for erasing inscriptions in wax (Kellner 1971, p. 103). Some of the iron pencils found at Straubing are peculiar in that the non-pointed end is not broad and splayed out but broad and tapering like a chisel and with an asymmetric edge (Walke 1965, p. 58, Tafel 112:1–2). Because a chisel end was less functional for erasing inscriptions in wax, it is not satisfactory to explain the chisel ends only as a whim of the workshop. Chisel ends are suitable for making short straight scores in wood, e.g. when inscribing runiform letters. The peculiar pencils found at Straubing may thus have been made for inscription of Latin or runic letters in wood.

No true runic inscription has been found at Straubing, but non-Latin rune-like forms occur in some of the Latin inscriptions there. Graffiti on pottery has ᚲ *k*, ᛊ *s*, and ᛟ *o*, (Walke 1965, Tafel 146–147). Bronze armour with Latin inscriptions has ᚲ *k* and ᛏ *t* (Keim and Klumbach 1951, p. 16, 20, fig. 13, 16). No comparable number of rune-like characters is known from any other Roman site of the 2nd century AD.

An old north–south trade route from the upper Elbe and the Bohemian basin crossed the upper Danube at Straubing. This trade route was important already in the late Neolithic and there was an *oppidum* at Straubing in the Celtic era (Walke 1965, p. 80). This was succeeded by a Roman fort in whose vicinity bronze, iron, wood, leather and cloth were worked (Walke 1965, p. 50–63). As the Nabatean wealth had been based on control of long-distance trade, auxiliaries of the *Canatha* cohort may also have been interested in engaging in the long-distance trade from Straubing.

The Roman army units at the *limes* normally got their supplies from their own provinces and sometimes also from nearby areas on the other side of the *limes* (Junkelmann 1997, p. 52–54, 73–85). By the end of the 2nd century AD the ongoing change to a wetter and colder climate in Central Europe accelerated and resulted regularly in poor harvests (Zabehlicky 1994). In the late 2nd century the population in the area of Straubing seems to have decreased drastically, possibly as the result of pest (Junkelmann 1997, p. 188). Then the Roman forces at the *limes* in south Germany probably could not get necessary supplies from the Roman hinterlands or nearby Germanic areas. They may have had better chances to find them in more distant Germanic areas (Lund Hansen 1995, p. 431–435). Auxiliaries may have had worse living conditions than legionaries, and those from the Near East would have had great difficulties in returning home when dissatisfied. Dissatisfied soldiers may have revolted and gone plundering as a result of the economic crisis (ibid., p. 435). If the *Canatha* cohort had heard about the trade route to Scandinavia they may have gone there to seek a living.

The Roman military presence at Straubing may be traced in the numbers of coins found there from different periods. While there are 1–3 coins from each of the emperors in the 1st century AD before the Roman fort had been established shortly after AD 76, the number is some 20–50 coins from most of the emperors in the period AD 81–211 (Walke 1965, p. 74, 80). As many as 24 coins of Septimius Severus (AD 193–211) have been found at Straubing, but only 0–2 coins from each of the subsequent emperors of the 3rd century (Walke 1965, p. 74). Of eleven coins found at Straubing that are thought to have been hidden, nine were struck for Septimius Severus (ibid..). These coin finds are best explained by unrest and the

termination of the military occupation of the fort at Straubing in AD 193–211 or shortly afterwards. The Canatha cohort thus seems to have left Straubing in this period.

Professional soldiers and reorganisation in Denmark from about AD 200

After c. AD 200 there were professional soldiers in Denmark, and war there reached hitherto unknown proportions and became much more bloodthirsty (Hedeager 1992, p. 92, 170, 22). Retainers seem to have served local chieftains in Denmark from c.. AD 200 on (Crumlin-Pedersen 1991, p. 42). Estates and powerful landlords seem to have emerged in Denmark in the 3rd century AD (Hedeager 1992, p. 199–201; Thrane & Porsmose 1996, p. 171–172). Hundreds, jurisdictional districts, were established in Denmark c. AD 200, probably by soldiers who had been in Roman service (Hedeager 1992, p. 189, 231, 248–249).

The new ownership of the land was accompanied by the introduction of innovations in land use, animal husbandry, and food production. Scythes for haymaking appeared in Scandinavia in the 3rd century AD (Pedersen & Widgren 1998, p. 358). Enclosed pastureland began to appear in Denmark and Eastern Sweden in c. AD 200 (Thrane & Porsmose 1996, p. 171–172; Pedersen & Widgren 1998, p. 292–306). Sheep and horse breeding seems to have emerged in Scandinavia in the 3rd century AD (Hedeager 1992, p. 160–161; Pedersen & Widgren 1998, p. 368). The earliest finds in Scandinavia of rotary querns, clay hearths, baking ovens and bread all date to c. AD 200 (Pedersen & Widgren 1998, p. 401).

About the same time specialised craftsmen and sites for crafts and trade emerged in Scandinavia (Storgaard 2003, p. 109). These were associated with the introduction of innovations in iron extraction, forging, and weaving (ibid.). Roman-standard carpentry seems to have been introduced about AD 200. A wooden plane was deposited at Vimose (Engelhardt 1869, p. 28). This tool from c. AD 200 is the earliest of its type in Scandinavia. Barrels appeared in Scandinavia as a high-status novelty after c. AD 200 (Lund Hansen 1995, p. 233–235). There were two-wheel carts in Denmark already in the Late Neolithic, but the earliest evidence of four-wheel wagons in Scandinavia is from the 3rd century AD (Pedersen & Widgren 1998, p. 338–339). A clinker-built ship found at Nydam in Jutland and dendrochronologically dated to c. AD 190 is the oldest true-clinker built vessel localised in northern Europe (Rieck 2003, p. 299).

There is no archaeological or historical evidence of sails among Germanic people in the Iron Age before the 8th century (Hårdh 1985, p. 182–183). A direct sea trade route was established, however, between the Danish Isles and the lower Rhine in c. AD 200 (Lund Hansen 1995, p. 385–388). This trade route with circumnavigation of most of Jutland would hardly have been viable without the use of sails. The earliest developed harbour in Scandinavia was established at Lundeborg on Funen in c. AD 200 (Jensen 1991, p. 133–135).

The Lundeborg site has evidence of the working not only of iron and bronze but also of silver, gold, and glass (P.O. Thomsen 1991, p. 138–140). This is the earliest Scandinavian evidence of silver and gold working. A measuring stick and scale pans have been found at Vimose on Funen (Engelhardt 1869, p. 30, 33). These finds of measuring gear are among the very earliest ones in Scandinavia and date to c. AD 200. Coins and gold to be used as payment have also been found at Lundeborg (J. Jensen 1991, p. 135, 140). A hierarchical system of long-distance trade centres emerged in Denmark in c. AD 200 when Roman objects arrived directly as trade goods from the lower Rhine to a leading long-distance trade centre in the Danish Isles (Lund Hansen 1995, p. 385–388).

Many innovations in technology and economy emerged in Denmark c. AD 200 according to the archaeological record. Innovations that appeared in other parts of Scandinavia at the same time but are not attested in Denmark at this early date probably also occurred in Denmark as it was the gateway to Scandinavia from the Continent and the Roman Empire. All these innovations occurred in the Roman Empire before they came to Denmark.

Storgaard proposed that the strong Roman

influences in Denmark and the Roman weapons in Denmark in c. AD 200 were the result of Zealand being a client or buffer state favoured by Roman supplies (2001). It is questionable, however, what attacks on the Empire a client state in Zealand would have been able to ward off. It is incredible that the Empire would have supported a distant Germanic group or area at a time when it seems to have been unable to provide necessary supplies for its own army in Roman parts of south Germany. Storgaard also argued that the aristocrats buried at Himlingøje in Zealand in about AD 200–250 would be of a dynasty that had ruled there since before the Marcomannic wars (2003, p. 112–120). They were, however, not buried according to the local tradition. The aristocrats of the 3rd century were interred in graves no longer visible in the landscape at a place where there had cremation burials under mounds in the 2nd century (Lund Hansen 1995, p. 191–195). The two male aristocrats interred at Himlingøje in the 3rd century also differed from those cremated there in the 2nd century in being remarkably gracile and among the tallest and most gracile males from the Iron Age in Denmark (Sellevold 1995). Storgaard has little archaeological support of his hypothesis that local people supported by the Roman Empire would have led the reorganisation that began in Denmark in about AD 200. This reorganisation was rather led by newcomers.

One thousand professional soldiers in chain mail, armed with long bows and damascened swords and mounted on horses or attacking in boats from the sea would have had the military strength to seize power in the whole of Denmark. In a much later conquest less than two hundred Spanish soldiers with only thirty horses managed to gain control of the Inca Empire.

The earliest runic inscriptions and their context

There are about 21 runic inscriptions that have been dated to AD 200/220–250/260 (in fact, phase C1b of the Roman Iron Age in northern Europe, but the corresponding dates AD are instead given in this paper; Krause and Jankuhn 1966; Ilkjær 1990, p. 324–325; Lund Hansen 1995, p. 17–18; Stoklund 1995). A fibula found at Meldorf north of Hamburg and dated to the 1st century AD has inscribed characters similar to runes, but they may be Latin characters or just decoration (Düwel and Gebühr 1981). A two-layer bone comb found at Vimose on Funen has a runic inscription, and the few finds of this type of comb have been dated to c. AD 70–160 (Ilkjær 1990, p. 324–325; 1993, p. 297, 312, 376). Dating the inscription by such a typological dating of the comb is a questionable procedure. The rune-inscribed spearheads found at Øvre Stabu in Norway and at Mos in Gotland have previously been thought to date from the 2nd century AD, but they were associated with objects belonging to the period AD 200/220–250/260 (Ilkjær & Lønstrup 1982a, p. 58–59). There is no incontestable evidence of any runic inscription earlier than AD 200/220 (Stoklund 1995, p. 318).

Apart from single finds from Norway, Scania and Gotland, all runic inscriptions from the period AD 200/220–250/260 are from Denmark and the bog site of Thorsbjerg in Germany very near the Danish border. These runic inscriptions are from rich graves and from war booty depositions at e.g. Thorsbjerg and Vimose (Stoklund 1995). The runic inscriptions from war booty depositions were mainly carved on the weapons of professional soldiers. All five runic inscriptions from rich graves in Denmark from the period AD 200/220–250/260 are on gilt silver rosette fibulae (ibid.).

The rosette fibulae of Denmark are so similar that they may come from a single workshop (Lund Hansen 1995, p. 213). Lundeborg is the only place in Denmark where silver is known to have been worked in the period AD 200/220–250/260. The nearby cemetery of Møllegårdsmarken is the largest Iron Age cemetery in Denmark. It has about 1400 graves from the Roman Iron Age, only three of them being inhumation graves (Albrechtsen 1971; Stilborg 1997, p. 47–49). All the silver rosette fibulae with runic inscriptions come from inhumation graves (Werner 1988). Wet sieving has shown that many of the cremation graves at Møllegårdsmarken contained melted droplets of silver and gold (Stilborg 1997, p. 48–49; Thrane 1998, p. 221). It may thus be that silver fibulae

with runic inscriptions were destroyed in the funeral pyres at Møllegårdsmarken (Thrane 1998, p. 222).

An iron knife with a runic inscription has been found at Møllegårdsmarken in a cremation grave dated to c. AD 240–320 (Lund Hansen 1995, p. 18; Stoklund 1995, p. 340). Because iron knives are less likely than silver fibulae to have been objects of long-distance trade, this inscription is a particularly good indication of the early knowledge of the runic script in southeast Funen.

Lundeborg is unique in Scandinavia with its homogeneous occupation layer and absence of normal aisled houses. Weights, coins, gold to be used as payments, glass beads, shards of Roman glass drinking vessels and *Terra sigillata* pottery indicate that goods were directly imported to Lundeborg and then redistributed (P.O. Thomsen 1991). This settlement has the earliest evidence in Scandinavia of ship repair. Lundeborg and nearby Gudme formed a complex and very affluent centre that must have played a super-regional role in the western Baltic area from around AD 200. Because a greater number of rare and singular Roman imports have been found in the graves at Himlingøje in south-east Zealand than in the graves on Funen, it has been argued that Himlingøje rather than Lundeborg was the centre of long distance trade in the period AD 200/220– 250/260 (Lund Hansen 1995, p. 389). The richer grave finds on Zealand may, however, be a result of inhumation on Zealand and cremation on Funen. The ship repair and the abovementioned indications of direct imports to Lundeborg show that the trade centre was probably on Funen and not on Zealand.

The wealthy settlement of Gudme with its varied set of cult-related objects and probably a sacral king seems to have been an ideal place for rune carvers (Thrane 1998, p. 223).

The origins of the professional soldiers

The Thorsbjerg war booty deposition is the southernmost site with early runic inscriptions and may be of particular interest when deciding where the professional soldiers came from. The swords deposited at Thorsbjerg were probably of Roman origin. Likewise the shield bosses, breastplates, leather belts, textiles, garments, and horse equipment may have been from the Roman Empire (Bender Jørgensen 1986, p. 349–351; Carnap-Bornheim & Ilkjær 1996, p. 471–486). As the embossed sheet-metal objects at Thorsbjerg are of comparatively high quality they are likely to have been made in the Roman Empire (Carnap-Bornheim & Ilkjær 1996, p. 481). Ilkjær & Lønstrup (1982) indicated nine shield bosses of Roman provenance and three fibulae of a type known almost exclusively from an area between the Elbe and the Rhine and concluded that the army whose equipment was deposited at Thorsbjerg had originated between the Elbe and the Rhine. Three fibulae are a slim basis for such a conclusion.

More than 180 belt buckles of Roman origin were deposited at Vimose (Carnap-Bornheim 1992, p. 50). It was proposed that all these were imported. It may be questioned, however, whether belt buckles or complete belts were valued so highly in Scandinavia that they were traded in such great numbers over great distances. It may rather be that the belt buckles were parts of belts that were worn by 180 soldiers who ultimately came from the Roman Empire. The Vimose deposition is therefore also of interest in finding the origin of the professional soldiers.

Other items in the war booty depositions in Denmark are best explained by the arrival of a rather complete unit of the Roman army. There are working axes, planes, files, anvils, and more that probably represent army-attached craftsmen (X.P. Jensen et al. 2003, p. 324–325). There are bone saws, a surgical knife, a forceps, and sloe thorns from the armamentarium of the army surgeon (Fröhlich 2003). There are large dogs that probably helped the scouts of intelligence and reconnaissance units (X.P. Jensen et al. 2003, p. 325–326).

The weapons deposited at Thorsbjerg included 46 arrows and three broken longbows, one of which was still 165 cm long when it was found (Raddatz 1987, p. 69–74). The nearby site of Nydam has produced a plane for arrow shafts and arrow shafts with runes (E. Jørgensen

& Vang Petersen 2003, p. 272; Stoklund 2003, p. 176). The long and carefully manufactured bows found at Thorsbjerg were probably made by artisans specialised in bow making (Jankuhn 1979, p. 348). Since the bow does not seem to have been a weapon among any Germanic people in pre-Imperial time and hardly in the Early Roman Iron Age either, the emergence of long bows after c. AD 200 is surprising (*Reallexikon der germanischen Altertumskunde* 1978, p. 164; X.P. Jensen et al. 2003, p. 316, 319). Certain Oriental auxiliaries are the only soldiers depicted with large (Scythian) bows on Trajan's column (Rausing 1967, p. 100). Auxiliary troops from the provinces used the bow, but otherwise it was hardly used at all in the Roman army until attempts were made to propagate its use by the end of the 2nd century (ibid. p. 100–101). All Roman units with Scythian bows in Early Imperial times seem to have been recruited from Syria and Roman Arabia (Walke 1965, p. 55–56).

The use of triangular arrowheads was connected with the use of the Scythian bows (ibid.). Whereas south of the Danish areas arrowheads were typically broad and leaf-shaped, arrow points with triangular and rectangular cross-sections are most common in the Nordic area (X.P. Jensen et al. 2003, p. 319–320). Arrowheads with triangular cross-sections have been found at Vimose, in one of the richest graves at Himlingøje, and at other places on Zealand (Lund Hansen 1995, p. 245). The only Roman army units equipped with Scythian bows and triangular arrowheads and stationed on the Rhine or the Upper Danube in Early Imperial times were *Cohors I Flavia Damascenorum* from Syria at Friedberg in Hessen, *Cohors I Ituraerorum* from Roman Arabia at Mainz, and the *Canatha* cohort (Stein 1932, p. 180, 188, 199; Walke 1965, p. 55–56). The professional archers who used the long bows found at Thorsbjerg and the triangular points found at different places in Denmark had probably served in one of these three units. Military diplomas indicate that while *Cohors I Ituraerorum* left Germany already in AD 88 the Damascus cohort remained at Friedberg until at least AD 134 and the *Canatha* cohort at Straubing until at least AD 166.

The parade armour found at Thorsbjerg includes a cavalry bronze helmet decorated with two serpents (Raddatz 1987, p. 57). Singular bronze helmets, each one decorated with a pair of serpents and an eagle on the top, have been found at Brigetio in Hungary, at Heddersheim near Frankfurt, and decontextualised in a collection in Hungary (Thomas 1971, p. 11–13). The top part of the Thorsbjerg helmet has no eagle but instead a circular hole with an inlaid ornamented plate (Raddatz 1987, p. 57). The circular hole and the inlaid plate may perhaps be a repair made after an eagle was broken off. The contemporary Vimose war booty deposition is located less than 50 km from Gudme and has yielded a cast and chased bronze griffin head in Roman style that has traces of solder and once probably adorned a helmet (Engelhardt 1869, p. 12, pl. 4). The feather decoration covering the head of the Vimose griffin is so similar to the feather decoration covering the eagles' heads in Hungary that the three heads must be very closely related. Filigree work is also represented on all three birds' heads. The helmets found in central Europe were probably of Oriental origin (Thomas 1971, p. 13).

The Thorsbjerg war booty deposition also included a gilt and silvered face mask made of silver and bronze (Raddatz 1987, p. 59). Apart from finds at Straubing and Kelheim on the upper Danube in south Germany (Menghin 1985, p. 186), gilt bronze or silver masks are rare north of the Alps. This find suggests that the professional archers at Thorsbjerg and in Denmark came from Straubing rather than the Rhine *limes*.

The Vimose deposition has yielded a plenitude of parade swords. Many of the sword hilts and chapes from Vimose are richly decorated with silver, gold, and ivory, probably of Asian elephant (Engelhardt 1869, p. 14–17). The swords deposited at Thorsbjerg seem to have been decorated in a similar way, but they have been less well preserved in the acidic environment (Ilkjær 1993, p. 477–478). The parade swords have a parallel in parade armour from Straubing. Straubing has yielded finds of parade armour that are unique in all of the Roman Empire (Keim & Klumbach 1951, p. V). The

Straubing finds include gilt bronze masks of Oriental type, non-gilt bronze masks of Hellenistic type, decorated knee and shank guards, and decorated plates of gilt and silvered horse head armour (Keim & Klumbach 1951).

A Vimose sword richly decorated with inlaid gold and a ring-shaped pommel (*Ringknaufschwert*) is so similar to swords found on the upper Elbe in Bohemia and at Straubing that the three swords were probably manufactured in the same workshop (Hundt 1953). Swords with rings on their handles (*Ringknaufschwerter*) have been found in Germanic Europe only along a narrow trail from Straubing, the Bohemian basin and along the Elbe up to south Jutland and Funen (Menghin 1985, p. 182; Kaczanowski 1994). While most *Ringknaufschwerter* have been found in Roman Central Europe, an unpublished sword found in Hauran in Syria also seems to be of this type (Biborski 1994; Lund Hansen 1995, p. 386–387). The *Canatha* cohort was recruited in Hauran. Miniature *Ringknaufschwert* pendants known from the Roman province of Upper *Germania* may reasonably be considered as symbols of imperial power and would have been worn by high officers (Oldenstein 1976, p. 152–157). It is a strange fact that no *Ringknaufschwert* pendants have been found in *Raetia* though some original *Ringknafschwerter* have been found there (ibid.). It could perhaps be that most high officers at Straubing in Raetia left the province when the living conditions deteriorated there by the end of the 2nd century. One *Ringknaufschwert* pendant has been found at Vimose and probably did not come there as a result of trade (ibid.). It was proposed to have been brought there as booty but may rather have been worn by a high officer that came to Denmark. X.P. Jensen stated that all the six *Ringknaufschwerter* found at Vimose would have been deposited there in the decades around AD 150 while the great majority of the 300 swords represented at Vimose would have been deposited there in the early 3rd century (2003, p. 226–231). Because no archaeological reason was given for this dating, it may rather be that the high officer's *Ringknaufschwerter* were deposited at the same time as most of the Vimose swords. There is no reason to believe that the Straubing *Ringknaufschwert* was earlier than the very late 2nd century (Biborski 1994, p. 91). The Himlingøje silver goblets depicting *Ringknaufschwerter* were buried only in the 3rd century (ibid., p. 228).

Chain mail from Roman times has similarly been found in Germanic Europe only in the Elbe area and South Scandinavia (Kaczanowski 1994). Chain mail was used by Orientals and Celts but not by the Romans (*Nationalencyklopedin* 1995:16, p. 95). The distribution of *Ringknaufschwerter* and chain mail indicates that the professional archers at Thorsbjerg and in Denmark would have come from Straubing rather than Friedberg or Mainz on the Rhine *limes*.

An embossed sheet metal phalera found at Thorsbjerg has representations of hippocampi, dolphins, and serpents (Raddatz 1987, p. 63). Hippocampi never appear in Scandinavian waters but occur in the Mediterranean and mainly live in tropical waters such as the Red Sea. Dolphins and serpents were the most commonly represented animals beside eagles in Nabatean art (Glueck 1966, p. 315–357, 471–491). The phalera was a 'provincial' Roman military order. Its ornamentation suggests that it belonged to a soldier from Roman Arabia. Chest fittings found at Straubing are shaped like dolphins (Keim & Klumbach 1951, p. 41, fig. 45; Walke 1965, p. 156, fig. 115). A Vimose fitting (Engelhardt 1869, p. 16, fig. 9) is very similar. A Vimose girdle also has a dolphin decoration (ibid., pl. 11).

Gold finger rings with serpent heads occur at Thorsbjerg and are clearly associated with the very richest graves from the period AD 200/220–250/260 in Denmark (Lund Hansen 1995, p. 229). There are also a few earlier pieces from northern Germany, Thuringia and on the upper Elbe in Bohemia (ibid., p. 210–212). A bronze ring with a serpent head and a gold finger ring with a serpent head have also been found at Straubing (Walke 1965, p. 53). The gold finger rings with serpent heads should be related to the bracelets with serpent heads (Lund Hansen 1995, p. 206). These probably had Roman models because the bracelets in both groups were made of gold, had terminals

in the form of animal heads, and were marks of distinction in a warrior context (ibid.). Because gold finger rings with serpent heads presumably also had Roman models, it is of interest that Straubing is the only Roman site known to have produced a gold finger ring with a serpent head.

Fibulae found at Thorsbjerg are decorated with a method remarkably similar to that of a hinge fibula found at Straubing (Walke 1965, p. 51). Swastika fibulae occur in the same area as the rosette fibulae with early runic inscriptions (Lund Hansen 1995, p. 215–216). Most finds are from Zealand and the earliest piece may be from Himlingøje and date to the period AD 200/210–250/260 (ibid.). The form may go back to provincial Roman swastika fibulae (ibid.). A silvered swastika fibula was found at Straubing and may date to about the 2nd century AD (Walke 1965, p. 148).

Many shield bosses found at Thorsbjerg are similar to a parade shield boss found at Straubing (Thomas 1971, p. 38–41; Raddatz 1985, p. 34–57). One of the Thorsbjerg shield bosses has the site's only inscription in Latin characters of a name, viz. AEL. AELIANUS (Raddatz 1987, p. 43). Aelius is the only attested name of the last known commander of the cohort that was stationed at Straubing, and he was commander there in AD 162 (Stein 1932, p. 284–286).

Thorsbjerg has not yielded a single Scandinavian strike-a-light. The strike-a-lights from Thorsbjerg may have come from a Germanic area between the Weser in the west, the Vistula in the east and the upper Danube in the south (Ilkjær 1993, p. 254–256). Strike-a-lights were hardly traded over any great distance but rather transported as part of the owners' personal equipment. This excludes the possibility that the professional archers at Thorsbjerg would have come from the Rhine limes but is consistent with their coming from Straubing. Long swords with inlaid metal figures from the late *limes* era were studied by Ulbert (1974). The swords found at Straubing and Nydam are uniquely similar in that their ratio between length and width is 17:1 and that the inlaid metal figures are a highly stylised Victoria. Other swords with inlaid Vicoria figures (and no other figure) have been found at Illerup in Denmark and Øvre Stabu and Rør in Norway. We may now consider that Nydam and Illerup have yielded more objects with early runes than any other sites except Vimose, and that Øvre Stabu is the only site in Norway with a runic inscription dated as early as c. AD 200. Three of the four non-Roman sites with Victoria swords are thus unusually closely tied to early runes, while this type of Roman sword has been found at no Roman site apart from Straubing. This traces the origin of the inventor(s) of the runes to Straubing rather than other places in the Roman Empire.

Conclusions

Most of the Germanic runes had Latin models. However, Nabatean characters explain, better than Latin ones, the forms and sound values of the five runes ᚦ θ, ᚷ *g* / ȝ, ᚹ *w*, ᛇ *j*, and ᛉ z and perhaps also those of runic ᛈ *p*, ᛖ *e*, ᛗ *m* and ᛚ *l*. There seem to have been good reasons for Nabatean models having been used instead of Latin ones in most of these cases.

Nabateans probably constituted the main part of a cohort of a thousand archers stationed at Straubing in Bavaria in c. AD 125–200. Indications of unusually intensive writing for an auxiliary camp and inscriptions with unusually many rune-like letters suggest that the runic script could have been developed by some of these auxiliaries.

At the time when this *Canatha* cohort left Straubing, about AD 200, professional soldiers who had been in Roman service appeared in Denmark and thoroughly reorganised society. They seem to have established themselves as a ruling nobility and introduced many innovations in e.g. animal husbandry, food production and carpentry. They probably introduced shipbuilding, the working of silver and gold, and a hierarchical system of long-distance trade centres.

The earliest runic inscriptions are likewise dated to about AD 200. They were inscribed on the weapons of professional soldiers. They were carved on silver fibulae that were probably produced at the technological and economic

centre on Funen. The earliest runic inscriptions were intimately connected with the arrival of professional soldiers from the Roman Empire.

The professionally made long bows at Thorsbjerg and the triangular arrowheads found in Denmark probably represent professional archers from the Roman army. The only professional archers on the Rhine and Upper Danube *limes* were in three cohorts from Syria and Roman Arabia. Two of them were on the Rhine *limes* and the third one was the *Canatha* cohort at Straubing. The distribution of chain mail, *Ringknaufschwerter* and silver masks indicates that the professional archers at Thorsbjerg are much more likely to have come from Straubing than from the Rhine *limes*. The distribution of other kinds of weapons and objects related to the professional soldiers corroborates this finding.

It may be concluded that the runic forms and the archaeological material point in the same direction. The forms of some runes are best explained by Nabatean models. The archaeological and historical material indicates that Nabateans who had served in the Roman army probably reorganised the society in Denmark and introduced the runic script there c. AD 200. There is not enough evidence to say whether the runic script was invented at Straubing, on Funen, or somewhere else.

A comprehensive discussion of the origin of the *futhark* should go beyond the origin of the runes. It should include the origin of the rune names and the order of the runes in the *futhark*. These issues will be dealt with in a forthcoming paper.

Acknowledgements

Bengt Odenstedt, Birgitta Hårdh, Henrik Williams, Klaus Düwel, Mats G. Larsson and Jan Retsö have given helpful criticism and suggestions for improvements to earlier versions of this paper. I of course have the sole responsibility for any faults and mistakes.

Sammanfattning

Ett semitiskt ursprung till några runor
Inflytelserika främlingar i Danmark ca. 200 e. Kr

De flesta germanska runor hade latinska förebilder men en del runor kan inte på ett övertygande sätt härledas från latinska bokstäver. Bokstäver av den nabateiska varianten av det arameiska semitiska alfabetet kan bättre än latinska bokstäver förklara form och ljudvärde hos de fem runorna ᚦ *θ*, ᚷ *g/ʒ*, ᚹ *w*, ᛇ *j*, och ᛏ *z*. Kanske också hos ᛈ *p*, ᛖ *e*, ᛗ *m* och ᛚ *l*.

Det nabateiska riket omfattade ungefär nuvarande Jordanien och Sinai, men ockuperades av romarna 106 e.Kr. och blev provinsen *Arabia*. Nabatéer utgjorde troligen huvuddelen av en kohort med 1000 bågskyttar som stationerades vid Straubing i Bayern ca 125 e.Kr. Vid utgrävningar har man där påträffat anmärkningsvärt många skrivdon och inskriptioner, varav ovanligt många med runliknande bokstä-

ver. En gammal handelsled till Skandinavien korsade Donau vid Straubing. Kohorten med tusen beridna bågskyttar torde ha lämnat Straubing ca 200 e.Kr. då det tycks ha blivit problem med försörjningen i Sydtyskland.

Professionella soldater som varit i romersk tjänst framträdde i Danmark ca 200 e.Kr. och omorganiserade samhället i Danmark. De tycks ha etablerat sig som en härskarklass och byggt upp ett hierarkiskt system för handeln med Romarriket. De införde troligen skeppsbyggeri, ädelmetallbearbetning och innovationer inom boskapsuppfödning och livsmedelsproduktion.

De äldsta runinskrifterna framträdde också ca 200 e.Kr. De finns på professionella soldaters vapen och på fibulor av silver.

De professionellt tillverkade långbågarna från Thorsbjerg och de triangulära pilspetsar som påträffats i Danmark härrör troligen från bågskyttar i den romerska hären. Sådana fanns vid gränsen mot germanernas områden endast hos två kohorter vid Rhen och hos kohorten vid Straubing. Utbredningen av bl.a. ringbrynjor, *Ringknaufschwerter* och silvermasker tyder på att bågskyttarna i Thorsbjerg kom från Straubing snarare än från Rhengränsen.

Slutsatsen är att runformerna och det arkeologiska materialet pekar i samma riktning. Några runors former förklaras bäst av nabateiska förebilder. Det arkeologiska och historiska materialet visar att nabatéer som tjänstgjort i romerska armén troligen omformade samhället i Danmark och introducerade runskriften där ca 200 e.Kr.

S. Junghans, E. Sangmeister, M. Schroder, Meta11analysen kupferzeitlicher und friihbronzezeitlicher Bodenfunde Europas. Studien zu den Anfangen der Metallurgie Bd. 1. Berlin 1960. 217 Seiten, 10 Tabellen, 37 Tafeln und 2 Beilagen.

Nachdem W. Witter das Interesse der Vorgeschichtsforschung an der Spektralanalyse friiher Metallfunde geweckt, die ersten Untersuchungsserien veranlafit und seine iiberoptimistischen Versuche einer kultur- geschichtlichen Interpretation dieser Analayse verbffentlicht hatte, ging die Forschung — wesentlich von ihm angeregt - zwei Wege: R. Pittioni und sein Wiener Kreis beschrankten sich im wesentlichen auf qualitative Metallanalysen und versuchten das Problem der Relation zwischen Lagerstatte und Fertig-

ware, dessen Komplexitat Witter nicht geniigend klar geworden war, vornehmlich durch Bearbeitung von Einzelfallen schrittweise zu klaren. H. Otto hingegen versuchte durch Verfeinerung der Analysen- auswertung das Untersuchungsverfahren zu vervollkommnen, gelangte in alien Fragen der Lagerstatten- kunde jedoch nicht fiber Witter hinaus. Sein Vorschlag, die zahlreichen quantitativ und qualitativ ganz unterschiedlich legierten Metalle zu einer Anzahl von signifikanten, erzkundlich begriindeten Leitlegierun- gen zu gruppieren, ist in der Tat ein ganz wesentlicher methodologischer Fortschritt. Er nutzte diesen zwar nur innerhalb bestimmter Grenzen, seine Arbeiten lieferten jedoch den natiirlichen Ansatz zum For- schungsvorhaben des Stuttgarter Kreises um S. Junghans. Gemeinsam mit H. Klein und E. Scheufele ver- offentlichte Junghans im Jahre 1954 seine Untersuchungen zur Kupfer- und Friihbronzezeit Sfiddeutsch- lands. Erst mit diesem Aufsatz wurde die Erforschung der friihen Metallurgie Europas auf ein wirk- lich verlafiliches methodologisches Fundament gestellt. Den sichtbarsten Fortschritt erbrachte dabei das von Klein ganz neu entwickelte Verfahren, Metallanalysen statistisch auszuwerten. Dadurch wurde Ottos Grundkonzeption, wenn auch in Einzelheiten modifiziert, so doch im allgemeinen bestatigt, vor alien Dingen aber methodologisch exakt untermauert. Nicht minder wichtig war indes in den Arbeiten des Stuttgarter Kreises der stillschweigende, aber konsequente Verzicht auf jede voreilige Frage nach der Her- kunft der zu den friihen Metallgegenstanden verwandten Metalle, bzw. Erze. Das Problem des mitteldeut- schen Erzabbaus, um das vorher so heftig - und letztlich miifiig — diskutiert worden war, war damit zunachst aus den Erbrterungen ausgeklammert. Dadurch wurde eine Verzettelung

der Arbeit vermieden; denn war es schon miihsam, eine ausreichende Zahl brauchbarer Analysen zusammenzubringen, so ware eine umfassende Erforschung aller Lagerstatten noch viel miihseliger gewesen. Seit langerer Zeit ist es namlich bekannt, dafi die spurenmafiige Zusammensetzung der Erze nicht in alien Bereichen ein und der- selben Lagerstatte vollkommen gleich ist. Welcher umfassenden Arbeit hatte es bedurft, dieser Tatsache

Rechnung zu tragen?!

Nach den ersten, im Jahre 1954 veroffentlichten Ergebnissen wurden Junghans und sein Kreis zu einem festumrissenen, langfristigen Programm angeregt. Ein Bericht aus dem Jahre 1957 gibt dariiber erstmals einen summarischen Uberblick. Mittlerweile war zu den eigenen Analysen - bis 1954 waren es 410 - zahl- reiches verbifentlichtes und auch unverbffentlichtes Material zur Auswertung hinzugekommen. Der Stutt- garter Kreis selbst konnte vom Jahre 1955 an jahrlich 300 Metallproben untersuchen und verfiigte 1957 schon fiber insgesamt 2260, kurz danach fiber 2302 Analysen. Das reichte als Grundlage fiir eine erste Demonstration der Richtigkeit und vor alien Dingen der Bedeutung des neuen Weges aus. Ein soldier Versuch erschien um so erfolgversprechender, als es inzwischen gelungen war, die Zahl der durch stati- stische Auswertungen gewonnenen Materialgruppen von vier auf zwblf, bzw. dreizehn zu erhbhen.

Die Aufhellung der Anfange der Metalltechnik in Europa und der mit der Einffihrung der Metalle verbundenen chronologischen und kulturellen Fragen stellt sich die erste grbfiere Publikation des Stutt- garter Kreises, die nunmehr schon geraume Zeit vorliegt, als Aufgabe. Die Darstellung umfafit einen Bericht fiber die Kupfer- und friihe Bronzezeit im westlichen Teil von Europa nach dem derzeitigen For- schungsstand (S. 8-56), eine knappe Darstellung des Charakters der Materialgruppen (S. 57 f.), ihrer geographischen Verbreitung (S. 59—64) und ihrer Zeitstellung (S. 64-90). Dem Text sind Exkurse fiber Spezialfragen angeschlossen, die paradigmatisch zeigen sollen, bis zu welchen Lbsungsmbglichkeiten der nunmehr erreichte Erkenntnisstand fiihrt. In diesem Sinne werden die friihbronzezeitlichen Hortfunde (S. 171—180), die Schnurkeramik (S. 181-186) und die Glockenbecherkultur (S. 187-197) behandelt. Dem Text ist ein Verzeichnis von 861 neuen Analysen (S. 92-115), ein Anaiysenkatalog (S. 116-131) und ein Materialgruppenkatalog (S. 132-139) eingeffigt. Ferner sind fiinf Listen mit Analysenkonkordanzen (S. 139-147) und ein Analysenverzeichnis, worin diese nach Zeit- und Kulturgruppen gegliedert sind (S. 148-170), beigegeben.

Mit den durch das Thema des Buches gestellten methodologischen Problemen steht der Uberblick fiber Aneolithikum und Friihbronzezeit (S. 8-56) nur in indirektem Zusammenhang, doch ist er zum Verstand- nis vieler kulturgeschichtlicher Folgerungen erforderlich, die im Buche behandelt werden. Er gibt den Forschungsstand des

ausgehenden Jahres 1956 wieder. Nur einzelne spater erschienene Arbeiten konnten noch eingearbeitet werden, und auch diese nur teilweise. Die Materialgruppen, die die Verf. neu nach- weisen kbnnen, werden S. 57 ff. kurz aufgezahlt. Dafi sie von M. Schroder auf Grund des von Klein ent- wickelten statistischen Verfahrens ausgesondert wurden, war schon friiher bekannt. Dem Nichtmetallur- gen werden die Grundprinzipien, die bei der Ausgliederung von neuen Gruppen angewandt wurden, durch die Taf. 1 und 2 naher erlautert. Eine nahere Begrfindung, die doch nur der Metallurge verstanden hatte, wird nicht gegeben. Am Rande wird erwahnt (S. 58), dafi in einzelnen Fallen die Zuweisung einer Analyse unsicher bleiben und es gelegentlich Schwierigkeiten machen kann, fremde Analysen eindeutig in eine bestimmte Materialgruppe einzuordnen. Es wird glaubhaft gemacht - wenn auch nicht eindeutig nachgewiesen -, dafi die Zahl solcher nicht einwandfrei klassifizierbaren Analysen gering ist und sie das durch die Auswertung gewonnene Bild nicht beeintrachtigen kbnnen. Fiir die Benutzer des Buches ware es eine Hilfe, wenn diese unsicheren Analysen naher gekennzeichnet worden waren.

Um die Hauptverbreitungsgebiete der Materialgruppen darstellen zu kbnnen, haben die Verf. ihr Bear-

beitungsgebiet unter Beriicksichtigung der in der Kupfer-und der Friihbronzezeit vorhandenenKulturgrup- pen in fiinfzehn Raume eingeteilt (S. 59 f.). Eine Untersuchung der Verbreitung der Gruppen gibt fast fur jede einen kennzeichnenden Schwerpunkt. Auf dreizehn Karten (Taf. 31-37) sind diese schematisch, aber iiberzeugend dargestellt. Die Verbreitungsunterschiede bestatigen die Richtigkeit der Materialgruppen und zwar selbst dort, wo die statistischen Anhalte nicht ganz eindeutig sind.

Zum Nachweis der Zeitstellung der einzelnen Materialgruppen versuchen die Verf. die Gesamtzahl der Analysen auf einzelne chronologisch fixierbare Typen, Typen- und Kulturgruppen zu verteilen (S. 65 f. und Tab. 7-10). Das Ergebnis lafit sich besonders sinnfallig in Tab. 10 erfassen und zeigt, daB in der Kupferzeit ganz andere Materialgruppen vorwiegen als in der friihesten Bonzezeit und dafi in letz- terer wiederum solche Materialgruppen vertreten sind, die in der fortgeschrittenen Friihbronzezeit kaum noch eine Rolle spielen. Auf dem Umwege liber Verbreitung und Zeitstellung kommen Verf. — methodisch einwandfrei — zu gewissen Vorstellungen liber die Provenienz der Metalle, bzw. Erze. Es zeigt sich dabei, dafi mutmabliches Herkunftsgebiet und Schwerpunkt der Fundverbreitung weder kongruent noch iiberhaupt identisch zu sein brauchen.

Besonders iiberzeugend ist das Ausfallen des friiher postulierten mitteldeutschen Erzabbaus in der Kupfer- und Friihbronzezeit. Dafi sich das Arsen-Kupfer der ’Gegend von Zwickau' in den Gruppen E 01 und B 1 findet, deren ausgesprochene Schwerpunkte auf der Iberischen Halbinsel bzw. im Rhonegebiet liegen, so dafi die Verf. geneigt sind, sie als ’spanische', bzw. ’siidfranzbsische Gruppe' zu bezeichnen (S. 67 und 78), ist ebenso kennzeichnend fiir den Forschungsstand und die bisherige Forschungsweise in der Lager- stattenkunde wie die Verteilung der Erze des ’Kamsdorfer Reviers' auf die ’bayerische' Gruppe C 2, die ’bohmisch-mahrische' Gruppe B 2 und die ’siidwestdeutsche' Gruppe A.

Raum- und Zeitgliederung der Materialgruppen erscheint also im Uberblick durchaus einleuchtend. Es verdient hervorgehoben zu werden, dafi nunmehr ein alter Einwand gegen eine kulturgeschichtliche Auswertung der Metallanalysen als ausgeraumt gelten kann. Friih schon erhob sich gegen Witters Aus- wertung der Vorwurf, sie lasse die Mbglichkeit einer Verwendung von Altmaterial und das Zusammen- schmelzen von Metallstiicken unterschiedlicher Zusammensetzung ganz aufier Betracht. Witter hat den Ein- wand bald, doch ohne rechte Begriindung zuriickgewiesen, und auch Otto hat mehrfach - letztmals 1958 - hervorgehoben, dafi sich kaum Hinweise auf Vermischung von Leitlegierungen fanden. Die Verf. bestatigen diese Auffassung nun im wesentlichen und versuchen sie dadurch zu erklaren, dafi geschmiedetes Kupfer zum Umschmelzen nicht in Frage kommt. Man hatte es allenfalls umschmieden konnen. Erst von der jiingeren Friihbronzezeit an, als man vornehmlich bronzeartige Legierungen verarbeitete, hatte man auf Altmaterial zuriickgreifen konnen. Immerhin gibt es sowohl in der Kupfer-, als auch in der beginnenden Friihbronzezeit geniigend gegossene Gegenstande, fiir die diese Erklarung nicht stichhaltig sein kann. Vielleicht gab es einen anderen Grund: Das Metall war anfangs so knapp, dafi nach der Niederlegung von Geraten, Waffen und Schmuck in Grabern oder Depots nichts Wesentliches mehr iibrig blieb, was als Alt- material hatte verwandt werden konnen. Noch in der entwickelten nordeuropaischen Bronzezeit war anscheinend der Bestand an Bronzegeraten in jeder Generation ziemlich erschopft, wenn die durch das Ritual geforderten Deponierungen vollzogen waren. Das lafit sich am Fundgut durchaus veranschaulichen. Die Verf. sind gewifi im Recht, wenn sie trotzdem in gewissem Umfange mit Umschmelzprodukten (S. 82) oder mit beabsichtigter Anreicherung der Metalle mit bestimmten Substanzen - z. B. Arsen oder Zinn - rechnen (S. 91). Den gegebenen Weg, Aufschliisse liber die Kenntnisse der friihen Bronzehandwerker von der Verwendbarkeit von Metallen verschiedener Provenienz und von der Eigenschaft bestimmter Legie- rungen zu erlangen, sind sie vorerst noch nicht nachgegangen.

Einen Ansatz fiir solche Untersuchungen bieten die triangularen Vollgriffdolche Taf. 3 und Taf. 5, sowie die Dolchklingen Taf. 11 und Taf. 13. Der Dolch Taf. 3 hat eine Klinge aus Materialgruppe B 2, einen Griff aus Gruppe C 2, wahrend die Nieten aus Metall der Gruppe

B 1 bestehen. Dolch Taf. 5 besteht aus Metall der Gruppe E 00; ein Niet enthalt dagegen Materialgruppe F 1. Die Dolchklingen Taf. 11 und 13 bestehen aus Gruppe F 1. Ein Niet des ersteren enthalt Gruppe E 10, ein Niet des zweiten Material der Gruppe A. Es kame zunachst darauf an, moglichst viele Gegenstande, die aus mehreren Teilen zusammengesetzt sind, zu analysieren. Traten dabei feste Regeln zutage - bei den vier genannten Beispielen kann man es vorerst nicht behaupten - oder waren mit Sicherheit keine Regeln nachweisbar, auf alle Faile ware man wieder einen Schritt weiter gelangt.

Es ist nicht ausgeschlossen, dafi eine detaillierte Analyse der Gufikuchen und echten Barren in dieser Rich- tung noch weiter fiihrt. Man miifite schliefilich zu gewissen Vorstellungen kommen, welche Legierungen man evtl. schon friih absichtlich herstellte oder welche Metallsorten man wegen ihrer spezifischen Eigen- schaften fiir bestimmte Gerate oder Gerateteile bevorzugte, eventuell ihrer Qualitat wegen aus der Feme bezog. (Die Bevorzugung gewisser Metalle fiir bestimmte Gegenstande, auf die Otto hinweisen zu konnen meinte, trifft in dem Sinne, wie er es darstellte, nicht zu. Er versuchte sie an Gegenstanden verschiedener Zeitstellung zu demonstrieren und liefi dabei das Vorwiegen verschiedener Legierungen in bestimmten Zeitabschnitten ganz aufier Betracht). Mdglicherweise feststellbare Unterschiede zwischen Gufikuchen- und

Barren-’Legierungenc und der Metallzusammensetzung gleichzeitiger Waffen, Gerate oder Schmuck konnten wesentlich helfen.

Auf ahnliche Weise konnte man vielleicht auch weiterkommen, wenn man systematised Gegenstande analysierte, die nachweislich aus einer Gufiform stammen. litre Zalil ist sicher nicht so gering, wie es den Anschein hat, denn nachtragliche Uberarbeitungen (Schmieden) werden die Herkunft aus derselben Form oft verdecken. Es ware natiirlich zu erwarten, daft solche Stiicke durchweg der gleichen Materialgruppe angehoren. Ware das gelegentlich oder haufiger nicht der Fall, wiirden sich verbindliche Schliisse auf gleichzeitige Verwendung verschiedener Materialgruppen ergeben.

Schliefilich ware es auch nicht unwichtig, systematisch alle Stiicke eines geschlossenen Fundes zu untersuchen und dann moglichst viele geschlossene Funde ahnlichen Charakters zu vergleichen. Ansatze dazu macht die vorliegende Arbeit sichtbar. Der Depotfund von Aschering umfaftt sieben Osenhalsringe der Gruppe C 2 und je einen der Gruppen B 2, F 1 und F 2. Der Fund von Berkach besteht aus zwei Ringen der Gruppe B 2 und einem der Gruppe C 2. In Gammersham fanden sich vier Ringe der Gruppe C 2 und einer der Gruppe F 1. In Hagelstadt waren es je zwei Ringe der Gruppen C 2 und F 2 und

einer der Gruppe B 2, in Muhlhausen zwei Ringe der Gruppe C 2 und einer der Gruppe C 3, in Roth ausschlieftlich Ringe der Gruppe B 2, in Reut vier Ringe der Gruppe F 1 und einer der Gruppe E 00, in Straubing drei Ringe der Gruppe C 2 und sieben der Gruppe F 1. Die Streuung der Materialgruppen, die in diesen Osenhals- ringen sichtbar wird, kann kaum auf Zufall beruhen, es sei denn, die Abgrenzungen der in den Horten vertretenen Materialgruppen ware ebenfalls teils zufallig. Was ergabe sie nun, wenn man sie auf die geschlossenen Funde sowie auf die geographische Lage der Fundorte bezoge? Die Verf. haben Versuche in dieser Richtung unternommen, die aber - wie gleich zu zeigen sein wird - nicht befriedigen konnen! Fragen dieser Art, die sich aufdrangen, zeigen, welche Bewegung durch die neuen Methoden der Aus- wertung von Metallanalysen in die Bronzezeitforschung kommen wird, wenn sich diese einmal aus der bislang vorherrschenden ’typologischen' Betrachtungsweise geldst hat. Untersuchungen der Art, wie sie soeben umrissen wurden, wtirden natiirlich sehr viel ’gezieltere' Analysen erfordern: Etwa Analysen aller mehrteiligen triangularen Vollgriffdolche, Untersuchung der ’Knebel' von Gallemose, der beiden Beile von Lilia Bedinge, der fiinf Vollgriffdolche von Stubbendorf und aller Osenringbarren, um nur ein paar interessante Desiderata zu nennen. Beim derzeitigen Forschungsstand sind allerdings vorerst weniger ’gezielte' als ’gestreute' Analysen erwiinscht, um zunachst einmal einen Querschnitt durch das gesamte Material zu erhalten. Vorerst ist dieses Ziel gewift noch langst nicht erreicht, denn die alten Analysen Witters und Ottos, die die Verf. mitbenutzen muftten und die trotz der ansehnlichen Zahl ihrer eigenen Analysen immer noch den Hauptteil ihres Materials ausmachen, umfassen die vorhandenen Gegenstands- arten in hbchst unterschiedlichem Umfange. Unter den 2302 von Junghans und seinem Kreis ausgewerteten Analysen befinden sich 336 Flachbeile und 308 Randbeile, die zum groftten Teil nicht aus geschlossenen

Funden stammen und sich deswegen auch zur Auswertung nicht besonders gut eignen. Dieser Mangel des von den Verf. bearbeiteten Materials, fur den sie selbst natiirlich nicht verantwortlich gemacht werden konnen, setzt manchem ihrer Deutungsversuche eine Grenze, die vielleicht heute noch nicht deutlich genug sichtbar ist.

Die Frage, wie weit die friihen Metallhandwerker es verstanden, nicht nur besonders erwiinschte Le- gierungen zu erzeugen, sondern auch ’Verunreinigungen1, die sich aus der verarbeiteten Erzart ergaben, zu beseitigen, lassen die Verf. aufierhalb der Diskussion. Schon Otto glaubte bemerken zu konnen, daft mit steigendem Zinngehalt die Beimengungen an Silber, Nickel, Arsen und Antimon immer geringer werden. Ihm schien das Bestreben zur Erzeugung immer reinerer Metalle unverkennbar. Aus dem Analysenkatalog der Verf. (S. 116-131) wird eine derartige Tendenz nicht sichtbar. Trotzdem bleibt die Frage, wann das Bemiihen, ’Verunreinigungenc aus dem Metall auszuscheiden,

erstmals aufkam und sich in den Analysen bemerkbar macht. Miiftte man bereits in der Friihbronzezeit mit einer Tendenz rechnen, reinere Metalle herzustellen, dann wiirde sich der Wert mehr oder minder zahlreicher Analysen nicht unbetrachtlich ver- schieben.

Daft die Kupfertechnik aus zwei verschiedenen Gebieten nach Mitteleuropa vordrang, aus dem Siidosten und dem Siidwesten, hat man seit langem vermutet. Nun weifi man es endlich auf Grund der Untersuchun- gen der Verf. genau (S. 90 f.). Ob allerdings der Siidwesten dabei einen Vorsprung von annahernd 300 Jahren hatte - wie die Verf. meinen -, wird man mindestens solange noch in Zweifel ziehen diirfen, wie der Forschungsstand auf der Iberischen Halbinsel nicht annahernd den der Balkanhalbinsel erreicht hat. Die Ubertragung nach Nordwest-, Mittel- und Nordeuropa verlief ’nicht in einer ungestdrten Uber- tragung technischer Fertigkeiten', wie die Verf. meinen (S. 91). Das friih schon im Siidwesten wie in Siid- osten bekannte Guftverfahren sei zunachst ’verlorengegangen‘, nur das Schmiedeverfahren sei anzutreffen, und der Metallguft sei dann sparer wieder aufgekommen. Die Verf. tun gut daran, es bei solchen Andeu- tungen zu belassen. Ehe man etwas Genaues liber die Verarbeitungsweise der verschiedenen Metall- legierungen noch nicht weift, wird man nichts Verbindliches fiber die Ausbreitungsweise bestimmter Metall- techniken sagen konnen. Hier erreicht man vorerst die Grenze der Mbglichkeiten, Metallanalysen kultur-

geschichtlich auszuwerten.

Das scheinen gelegentlich auch die Exkurse anzudeuten, die die Verf. ihrem Buch angeschlossen haben. Bei ihrem Versuch zu neuen Aussagen liber den Charakter der friihbronzezeitlichen Hortfunde zu gelangen, gilt ihnen als Ausgangspunkt ’die Zusammenziehung der Osenring- und Rippenbarren-Horte zu einem Hortfundhorizont', fur dessen Entstehen sie ’Ereignisse verantwortlich machen, die zur Ausbreitung der Formengesellschaft A 2 gefiihrt haben miissen' (S. 171). Im Jahre 1953 sprach Junghans davon, dafi das ’gewaltsame Endec der Stufe A 1 in Siiddeutschland ’neben der grofien Zahl ihrer im Voralpenland auf- gefundenen Rohmaterialdepots' durch das Vorkommen neuer Formen und die Verarbeitung anderer Rohmaterialien erwiesen wiirde. Seit Reinecke ist man in der Tat gewohnt, von dem Horizont der Osen- ring- und Rippenbarren-Horte wie von einem befriedigend bewiesenen Faktum zu sprechen. Der Wider- spruch Pittionis ist verhallt. Durchdenkt man das Problem der Osenring- und Barrenhorte aber einmal genauer und halt man Reineckes Auffassung gleichzeitig fiir das, was sie ist, namlich eine geistvolle Hypothese, so kommt man zu dem Ergebnis, dafi es durchaus nicht unmoglich ist, einen

’Unruhehorizont* gegen Ende von A 1 anzunehmen, dafi die Beweise dafiir allerdings schwach sind und keinesfalls aus- reichen, um daraus weitreichende Folgerungen zu ziehen. Umgekehrt gibt es eine Anzahl von Indizien, die gegen die Annahme eines Unruhehorizontes sprechen, die aber letztlich nicht ausreichen, um seine Existenz voll zu widerlegen. Eine Reihe von Fragen ist tells noch nie gestellt, teils niemals zufrieden- stellend beantwortet worden: Warum finden sich Osenringe und Rippenbarren fast ausnahmslos getrennt in Horten? Warum ist die Verbreitung der Osenring- und der Rippenbarren so sehr verschieden? Warum kommen westlich der Osenring- und Rippenbarrenhorte gehauft Spiralringhorte, nordwestlich davon ’Blechhorte' auf? Warum fehlen sowohl in Osenring- als auch in Rippenbarrenhorten - aber auch in den Spiralringhorten — fast stets Gegenstande anderer Art, wo sie doch kaum minder wertvoll waren und wo es doch ebenso nahe gelegen hatte, sie in Unruhezeiten zu bergen? Solange diese Fragen nicht befriedigend beantwortet sind, ist es nicht zu verantworten anzunehmen, dafi ’Rippenbarren etwas spater in Gebrauch kamen als die Osenringbarren‘ (S. 82) und dafi nur erstere sich ’bis in die beginnende Phase A 2 hinein' hielten (anders allerdings S. 175). Gewifi, Osenringbarren gehen bis in die Kupferzeit zuriick, wie die Funde von Baden, Judenburg und Lichtenworth zeigen. (Leider wurden gerade diese Stiicke bisher nicht analysiert! Es ware nicht iiberraschend, wenn sie sich dem Hort Pleitmannswang [S. 177] beiordnen wur-

den.) Ist es aber nachweisbar, dafi die Rippenbarren sie iiberlebten?

’Es scheint doch wohl so gewesen zu sein, dafi die Horte des Aunjetitzer Gebiets aus den gleichen Griin- den niedergelegt worden sind wie die bayerischen4 (S. 171); dieser Satz ist eine schlechte Grundlage fiir die nun folgende Untersuchung vornehmlich der Aunjetitzer, aber auch anderer friihbronzezeitlicher Hort- funde. Hinzu kommt, dafi der Gliederungsversuch der Horte schlecht dokumentiert und zudem methodisch anfechtbar ist. Man kann nicht im beliebigen Wechsel Hortgruppen an Materialgruppen oder an der Typenzusammensetzung orientieren. Ein brauchbares Ergebnis ware nur dann zu erzielen, wenn man eine rein typologisch gewonnene neben eine materialkundliche Hortgliederung stellte und dann beide Gliede- rungen vergleichend analysieren wiirde. Dabei kame der typologischen Gliederung sogar eine gewisse Pravalenz zu, solange die ’Wertigkeit' der Materialgruppen nicht vollig klar ist. Es fallt auf, dafi die Verf. bei ihrer Auswertung der friihbronzezeitlichen Horte keine solchen mit triangularen Dolchen ein- bezogen haben. Der erste aus drei verschiedenen Materialgruppen hergestellte Dolch hatte ihr Vorgehen ad absurdum gefiihrt.

Man kdnnte in diesen Betrachtungen noch fortfahren und wiirde weitere Ansatzpunkte fiir kritische Bemerkungen finden. Damit ware aber fiir die Sache nichts gewonnen. Im

Gegenteil; zu leicht verdeckt eine Rezension durch die Ausfiihrlichkeit der Kritik das, was sie eigentlich gerade besonders herausheben mochte, den besonderen Wert der vorliegenden Arbeit, und vermindert das, was sie speziell erreichen will, eine sachliche und fruchtbare Diskussion, die dem weiteren Fortschreiten der Forschung dient. Rez. mochte deswegen zum Abschlufi, um Mifiverstandnisse zu vermeiden, zusammenfassend auf die Anregungen hin- weisen, die er von den Verf. empfangen hat. Die Bronzezeitforschung Mittel- und Nordeuropas ist durch eine gewisse Armlichkeit und Einseitigkeit Hires Quellenguts (weitgehendes Fehlen von Siedlungsfunden, Eintonigkeit der Keramik, teilweises Vorherrschen, dann wieder fast volliges Fehlen von Metallgegen- standen, ungleiches Vorkommen von Depotfunden) in einer mifilichen Lage. Haufig bleibt es deswegen bei relativ begrenzten Einsichten in die Struktur der Kultur der Bronzezeit. So meinte W. A. von Brunn kiirz- lich sagen zu miissen, bislang ’sei die Forschung mit dem vorhandenen Material liber Forssanders Erkennt- nisse kaum hinausgekommen/ Das mag fiir manche anderen Arbeiten zutreffen, fiir die vorliegende aber nicht. Sie ist einer der sichtbarsten Fortschritte in der Erforschung der Bronzezeit in diesem Jahrhundert. Dabei darf man nicht vergessen, dafi sie erst ein Anfang ist. Wenn ihre Verf. vielleicht bislang — abgesehen

von einem gewissen Verwundern liber die erstaunliche Planmafiigkeit der entsagungsvollen Analysen- arbeit — zum Teil das Echo auf ihre Arbeit vermissen mufiten, so liegt das teilweise an der Neuartigkeit ihrer Methoden, teils an dem fiir einen Nichtmetallurgen ungewohnlichen Stoff, den sie bieten. Die Ver- wertung ihrer Arbeitsergebnisse wird vielleicht noch langer auf sich warten lassen; aber die Anerkennung wird dann um so sicherer sein.

Early Pastoral Nomadism and the Settlement of Lower Mesopotamia

JURIS ZARINS
Southwest Missouri State University
Springfield, MO 65804

The Akkadians' nomadic origins have generally been assumed. However, the conventional prehistoric archaeological picture fails to illuminate those origins and the Akkadians' involvement in Akkad. Thus the origins of pastoral nomadism must be sought in the context of mixed farming within the Fertile Crescent, specifically during the PPNB. Subsequent expansion into marginal agricultural lands led to a symbiotic relationship between pastoral nomads and farmers. The Akkadians seem to have moved into the northern Arabian steppe and desert (Jezireh and Hamada) during the mid-seventh millennium B.C.; the PPNB/C populations apparently began intensive herding at the end of that period, and maintained ties to the Fertile Crescent seen in both exotic trade and everyday culture. They began to penetrate into Akkad during the time under discussion. Archaeological sequences in the Arabian desert suggest that the Akkadians probably were of a West Semitic (Levantine) background. Thus, the alluvium in the Akkadian area became a distinct entity as early as ca. 6000 B.C. and represented the early prehistoric forerunners to Akkadians of the fourth and third millennia B.C.

INTRODUCTION

A half century has passed since the appearance of Jacobsen's two seminal works on the early historical settlement of the southern Mesopotamian plain. The first (Jacobsen 1939a), dealing with ethnolinguistic questions, set the tone for evaluating the Sumero-Semitic interaction during the mid-third millennium B.C. and later. The appearance of his Sumerian King List (SKL) in the same year (Jacobsen 1939b) took us to the frontiers of early recorded history for the same region. Our perceptions of the early historic settlement of the southern alluvium have changed greatly since then. We should hardly find that surprising given the nature of cuneiform and archaeological studies: much of the change involves a wide variety of data from many sources. From Mesopotamia itself, the survey of the southern plain has shown the changing patterns of settlement over many millennia (see esp. Adams 1965; 1972; 1981; Adams and Nissen 1972; Jacobsen 1969; Wright 1981). The post-World II archaeological definition of the Near Eastern Neolithic has been critical to our understanding of Mesopotamian origins, and the excavations at Mari, Ebla, and Abu Salabikh have widened our horizons for the third millennium B.C. Finally, the exploration of the larger Arabian peninsula, from both a geological and an archaeological perspective, has improved our understanding of the Mesopotamian data. Clearly, while examining each of those topics separately would be a herculean task, a brief examination of each will help clarify the central questions of the current study: first, how and when did early pastoral nomadism from the greater Arabian peninsula affect human settlement on the alluvium? and second, can we be justified in examining the historical Semitic presence in Mesopotamia and relating it to the earlier archaeological record?

AKKAD IN THE EARLY THIRD MILLENNIUM B.C.

The study of Semitic populations within the southern alluvium hinges on three generalizations found in virtually every examination of the problem. First, based on anthropological studies of regions in which both sedentary and mobile populations

have been present, the consensus is that a symbiotic or closely linked relationship exists between the nomadic and sedentary groups. The particular ecological development between them in such regions is very closely intertwined. Settled and nomadic components ("tribe and town, desert and sown") must integrate to create a "dimorphic," or mixed, society with different social forms (Rowton 1969: 311; 1973a: 257). That way of life was particularly characteristic of Akkad (fig. 1) due to the specific geomorphological and ecological conditions there both in the past and present (Rowton 1969: 311). Based on the contemporary record, historians and archaeologists also conclude that since it appears unlikely that the Sumerians (and possibly their predecessors) originated from a nomadic background, the Semitic element contributed most substantially to that biethnic or dimorphic condition, especially in Akkad (Falkenstein 1954: 789; Moscati 1957: 50; Gibson 1972a: 2; Rowton 1969: 311; Knapp 1988: 77).

The second statement hinges on the popular and widespread notion that the Semites invaded the alluvium in periodic waves. Generally, the grouping works chronologically as follows (Kupper 1957: xiv–xv; Adams 1974: 2; Kienast 1981: 83–84; Gelb 1961a: 27):

Akkadian:	ca. 3000–2500 B.C.
Amorite:	ca. 2500–1800 B.C.
Aramean:	ca. 1500–900 B.C.
Arab:	ca. 900 B.C.–present

These "more pastoral and tribally organized invaders" generally are integral to the study of the alluvium and exhibit interdependent forms of adaptation on the plain (Adams 1974: 2).

The third generalization holds that the "nomadic" settlement of the Syrian Jezireh and its impact on Mesopotamia was a late development. Historians have regarded Arabia before 2000 B.C. as a "waste land" (Gelb 1961a: 27), "barely inhabited before the domestication of the camel" (Rowton 1982: 319). Scholars do not consider the prehistoric aspects of pastoral nomadism or climatic improvement, nor do they present a reasoned argument for relating historical development to prehistoric cultures. Such shortcomings in scholarship make it impossible to interrelate the inhabitants of the Arabian peninsula with those of the civilized lands such as Mesopotamia and Egypt or

even the villages of the Fertile Crescent. The Arabian peninsula is forever seen as a literal and cultural blank (see Knapp 1988: maps 2–3; 3–1; Nissen 1988: fig. 14).

The idea that Amorites, Aramaeans, and Arabs were essentially pastoral nomadic Semitic people who invaded the plain has been largely accepted, perhaps based on the historical data extant for those populations (Buccellati 1966; Kupper 1957; Brinkman 1968; Hitti 1970; Gibson 1972a: 2). The crux of the matter in historical terms centers on the "Akkadians." "Akkad" as an ethnopolitical entity is a very vague concept and the use of the term in royal titulary does not begin until Ur III (Hallo 1957: 87–89; Rowton 1982: 319). The (presumably) Sumerian logogram URI (meaning Akkad) has no satisfactory etymology (Edzard 1960: 244; Kraus 1970: 36–42, 61–82; Edzard, Farber, and Sollberger 1977: 175–76) and we do not know when the term came to mean "Akkad" (for the Uruk IV period attestation of the sign, see Green and Nissen 1987: 305, no. 594). The older title "King of Kish" may have represented early political control over the area later known as Akkad (Gibson 1972a: 2; n. 20). Therefore, the study of Semitic populations within the Akkadian area can proceed only if we analyze the political and economic history of the region in conjunction with contemporary historical documentation. Although many of the data have been presented before, notably by Gelb and Jacobsen, more recent information can tie together some relevant observations.

Jacobsen's reconstructed Sumerian King List begins with Etana in the Early Dynastic II period (his ca. 3100 B.C.) as the first authentic "king" of Kish (Jacobsen 1939b: 152; Table 2). He suggests that the earlier legendary rulers belonged to a more remote period. Table 1 presents an Early Dynastic I–IIIa sequence that follows his reconstruction and adds more recent relevant material from Kish, Mari, and Ebla.

At least 13 of the 23 names that the table lists from the SKL for the Kish I dynasty are Semitic (Gelb 1961b: 4–5; 1981: 54–55; Edzard 1960: 245) as are the majority of attested names from independent sources. However all of the names are probably Semitic, some merely expressed in Sumerian ideographs. At Mari, a series of six names attested in the SKL have now been reconstructed as Semitic (Geller 1987; Gelb 1989), as have all of the independently attested inscriptions (Dossin 1967; Gelb 1989). The one name from Sippar in the SKL appears to be Sumerian but the one independently attested (ED II–IIIa?) name is Semitic: Manki-Beli (Budge 1899: pl. 4/22451; Walker and Collon 1980: pl. 27/21; Gelb 1961b: 2 *contra* Leichty 1986: 212).

The presence of nonroyal Semitic names and words is also attested from the northern part of the alluvium. Many private votive inscriptions and land sale documents are either from Kish, Sippar, or other northern centers, or contain Semitic names and phrases (Edzard 1960: 245–46; Gelb 1960: 266; 1961b: 2–4; 1981: 55; Gelb, Steinkeller, and Whiting 1990). Economic texts from Kish and Mari mention Semitic names and phrases, e.g., *mi-at* for "hundred" (Gelb 1960: 266; 1981: 55; 1989: 129; Charpin 1987: 89–90). Deities also occur in Semitic form (Gelb 1989: 132). The recently reconstructed Old Semitic calendar system from the Early Dynastic had a wide distribution in the Upper Euphrates at Ebla, Mari, and presumably Kish (Lambert 1970; Charpin 1982; 1987: 90; Pettinato 1977; 1981: 147–48).

The Semitic developments in Akkad during the early third millennium B.C. are reflected in materials recovered in Sumer. Semitic names are attested in Early Dynastic documents from Fara, Adab, Ur, Lagash, and Nippur (Gelb 1961b: 4). Akkadian loan words passed into Sumerian (Gelb 1960: 266; 1961b: 5, 141). Biggs (1967; 1974) has noted scribes with Semitic names at Abu Salabikh. In an Abu Salabikh economic text (IAS 518), the use of Semitic *li-im* for "thousand" and *mi-at* for "hundred" parallels the usage at Mari and Ebla (Biggs and Postgate 1978: 106–7). Another economic text from the site (IAS 508) may be written in Semitic (Biggs 1974: 44, 96). Texts from Abu Salabikh, Adab, and Girsu use the early Semitic month names as well (Gelb 1989: 140; Charpin 1987: 90). The Abu Salabikh literary text IAS 326 (+ IAS 342) is referred to as a Semitic hymn to the sun god (Michalowski 1987: 171). It may have duplicates at Mari and Ebla and is probably written in Semitic (Michalowski 1987: 171; Gelb 1987: 53; Edzard 1984: no. 6; Archi 1987: 128–30). Biggs (1981: 127) suggests it was composed at Kish or Ebla.

A number of royal personages in Sumer had close Semitic ties. Pu-abi, a Semitic queen at Ur, belongs to the ED IIIa (Sollberger and Kupper 1971: 41). Meskiaganunna, king of Ur during the ED II(?), had a Semitic wife who in one of the earliest Semitic texts from the south dedicates an offering for him (Sollberger 1965: no. 2; Sollberger

*The basic order of names for Kish is after Hallo 1971: 40, 46 and figs. 7, 8; for Mari and Ebla, see Archi 1985; 1987; Geller 1987: 144–45; Gelb 1989.

**Contemporary mention or inscription.

and Kupper (1971: 43). At Lagash, Ur-Nanše had a Semitic wife, Abda (Sollberger 1956: 2, no. 20; Sollberger and Kupper 1971: 45).

The early mention of Semites as destructive nomads revolves around the epic *Lugalbanda and Enmerkar*, which presumably took place in ED II since an early fragment is known from ED IIIa (Biggs 1966: 85, n. 88; 1974: 91 no. 327). In that account, the Semitic MAR.TU besiege Uruk, having ravaged the Sumerian and Akkadian countryside in the past (Kramer 1963: 273; Rowton 1969: 313–14). However, the best known contemporary Sumerian example of the term for the Semites comes from the reign of Eannatum of Lagash (ca. 2400 B.C.). In an inscription dedicating a large Lagash canal, he states that his Tidnum name—his Semitic tribal name—was Lumma. This is in contrast to his "national" (*kalam*) name. Sollberger suggests that the Semitic background was possible since in the *Stela of Vultures*, Eannatum says that Inanna gave the young prince his Sumerian name (Sollberger and Kupper 1971: 60, 48, n. 3). Edzard suggests that a Tidnum name was reasonable, for Tidnum soldiers served in Eannatum's army (Edzard 1960: 249–50; for at least three possibilities of interpreting this Semitic name, see Gelb 1980: 144, 147). Kramer suggests that Tidnum, later a MAR.TU tribal name, refers here to the regions west of Sumer (Kramer 1963: 53, 55; Buccellati 1966: 244; see also Heltzer 1981: 1–3; Edzard, Farber, and Sollberger 1977: 157; Edzard and Farber 1974: 30). Tidnum, read as GÌR.GÌR in the above Eannatum inscription, has other ED IIIa parallels. In the *Archaic City List* (Green 1986: 77; Archi 1987: 128) from Abū Ṣalābīkh, Tidnum is read as GÌR.PIRIG (Biggs 1974: no. 21, col. iii, line 1) with a duplicate

from Fara (Deimel 1923: no. 25; Civil, personal communication). This earlier combination goes back to the Protoliterate or Jemdet Nasr period. The sign ligature GÌR.PIRIG there is read as Tidnum in the Uruk example of the *Archaic City List* (Green and Nissen 1987: 294, no. 552).

Our understanding of the Semitic presence in "Akkad" hinges on a date for those early royal and common references. Sign orthography, historical synchronisms, and textual examination help determine a date for the early "Akkadian" rulers of the northern alluvium. Jacobsen has suggested that "the heroic age" in which Sumer changed from council-orientated leadership to individual heroes or kings probably began ca. 2700 B.C. or ED II (Jacobsen 1957: 106–7, 120). It may have happened even earlier; the sign LUGAL is attested in Uruk III or ca. 2900 B.C. (Green and Nissen 1987: 240, no. 334). Based on the synchronisms in the SKL, several authorities have placed the "mythical" or "legendary" kings of Kish in ED I (Mallowan 1965: 69–70; Hallo 1970: 61, n. 59a; 1971: figs. 7–8). The division between the antediluvian and postdiluvian rulers, then, can be suggested as ca. 2900 B.C. or the beginning of ED I. That date may be confirmed by an examination of the five antediluvian towns of the SKL, only one of which (Larak) still awaits identification (Mallowan 1971: 289; Jacobsen 1987: 147, n. 8). The other four (Eridu, Bad-tibira, Sippar, and Shuruppak) were occupied during the Protoliterate–ED I periods (see Adams 1981: figs. 9, 27). In addition, in the north and south, cities began to take on large-scale urban proportions during ED I (Uruk: Nissen 1972; Adams and Nissen 1972: 12, 17–19, fig. 5; Kish: Gibson 1972b: 115; 1973: table 1).

Unfortunately, the archaeology of Akkad is poorly known. The major sites of Kish and Sippar have been treated in less than exemplary fashion and we are thus at the mercy of recent synthesized studies (Kish: Gibson 1972a; Moorey 1975; Sippar: Walker and Collon 1980). A brief examination of some relevant data from Kish, Sippar, and Mari may support the conclusions drawn from the historical data. Gibson, in his study of Kish, suggested that the A Palace and the cemetery could be dated to ED II based on the assumption that shell inlay fragments found there dated to that period (Gibson 1972a: 59; cf. also Weiss 1975: 435; Moorey 1967: 106–7; 1970: 93–94). The so-called Fara type tablets from Kish (Mallowan 1965: 70, n. 22; Gibson 1972a: 79), Gelb dates to the period preceding Fara, i.e., ED II (Gelb 1981: 55). Adams and Moorey state that the A Palace was in ruins by ED III and thus the Kish kings exercised their power earlier (Adams 1981: 88; Moorey 1975: 167). Mallowan (1965: 69) also suggests that the great palace dated to ED II.

The relevant material from Sippar was haphazardly excavated by Rassam in 1881 and 1882, probably from the É-Babbar. The material was reexamined recently. Of the 14 ED alabaster worshipper statuettes catalogued (Walker and Collon 1980: 96–97), one is inscribed by Ikun-Shamash of Mari (Table 1). Stylistically, they should belong to the ED II–IIIa (Porada 1965: 163). ED II–III maceheads, stone vases, and stone land sale tablets also clearly mark Sippar as an important ED II–III center. Unfortunately, we have little to suggest that Sippar was an important center in the preceding ED I.

The large number of inlay fragments, worshipper statuettes and plaques from Mari also confirm its tie to the alluvium and place it within the ED II–IIIa (Parrot 1956; 1967; 1971). Recent work in the central Euphrates region near Anah revealed at least three major ED I–III sites (Abdul-Amir 1988: 47–49). One, Ta^{c}as al-Kaffar, was a walled settlement (Abdul-Amir 1988: 117). Another, Usiyah, had an equid team burial similar to those from the Hamrin basin, Abū Ṣalābīkh, and Ur (Roaf and Postgate 1981: 198; Zarins 1986). Tell Chokheh, just north of Falluya, and Tell Aswad, south of Hit, also had substantial ED II–III occupations (Roaf and Postgate 1981: 174–75; Abdul-Amir 1988: 117), suggesting continuous interaction among the Kish and Sippar environs, the western desert and the area along the Euphrates to the north. That observation is confirmed by the Ebla texts, which show Kish, Mari, and Ebla were intimately connected (Archi 1987 and references). A mathematical text from Ebla (TM 75.G.1693) has a most interesting colophon that may read: "As established by the scribes of Kish" (Friberg 1983: 9; cf. Gelb 1981: 61).

A final archaeological observation should be made in support of this proposal: Recent work in the Gulf and Iran has established that the "série ancienne" or "Intercultural style" of steatite/soapstone vessels had not only a widespread geographical range, but also a short temporal range (Kohl 1974). Where provenance is known, the context suggests an identification with elites (Lamberg-Karlovsky 1988: 53–55). Vessels have been catalogued from Mari (Parrot 1956: pls. 46–52; 1967:

pl. 71; 1971: pl. 14), Kish (Kohl 1974; Lamberg-Karlovsky 1988: 57), Sippar (Collon and Walker 1980: 99), and numerous Sumerian sites, including Adab, Nippur, Ur, Fara and Ur (Lamberg-Karlovsky 1988). The presence of those vessels at Palmyra (Lamberg-Karlovsky 1988: 58 and reference) and the location of walled Early Dynastic forts on the Upper Euphrates reinforce the idea of a trade route through the western desert. Kohl (1979: 62; 1986: 368–74) suggests that the forms reached a peak of popular usage between 2600 and 2500 B.C. Potts (1985: 682, n. 51) places the peak between ED II and ED IIIa. From Tepe Yahya in Iran, the bulk of the excavated material is placed in Yahya IV B1–4, or 2700–2400 B.C. (Lamberg-Karlovsky 1988: 52). Excavation of late third millennium B.C. tumuli at Dhahran and Bahrain has failed to turn up Intercultural style vessels and thus also supports an ED II–IIIa date for the earlier style (Zarins, Mughannum, and Kamal 1984: 27; Ibrahim 1982: 34; Mughal 1983).

The conclusion here is that the title "King of Kish," used by rulers by the ED I–II, referred to political supremacy over the northern part of the plain ca. 2900–2500 B.C., a period when Semitic writing was beginning to be recognized as a state instrument for political domination (Biggs 1970: 138). Since Semitic populations exercised that control, they exerted political and socioeconomic power not only south into Sumer but also apparently north along the Euphrates to Mari and beyond. A cultural symbiosis was characteristic of the region and the early Semitic populations penetrated Mesopotamia through the middle Euphrates valley; they spread to the regions of Kish, Sippar, and Mari and moved sporadically south (Goetze 1961: 111). This being the case, their entrance into the plain as pastoral nomads would have occurred prior to ED I, or as Cooper (1973: 239–40) says, "Sumero-Akkadian language contact in Mesopotamia can be projected back literally to the dawn of history." Rowton (1969: 311) suggests that during the fourth millennium B.C., large areas of the steppe and marsh adjacent to the main watercourses were best exploited by mixed farming and pastoralism. Very little documentation can be generated to prove historically that "Akkadian" populations were nomadic, since our ability to interpret the Protoliterate texts is limited (above). However, if we are to take advantage of and explain the anthropological model and paradigm, we cannot arbitrarily suggest that the symbiotic interaction began only in ED I–II. Nor can we suggest that the same forces were not at work in prehistoric times, shaping the northern alluvium of Akkad. To best understand the nature of prehistoric settlement in the region we must turn to the earliest archaeological record of pastoralism and the Arabian Desert west of the alluvium.

THE PRE-POTTERY NEOLITHIC B COMPLEX AND THE FERTILE CRESCENT

Archaeologists in the last half-century have examined closely the "Agricultural Revolution" in the Fertile Crescent, particularly along the northern rim of the Mesopotamian plain and especially at the limits of natural rainfall farming (fig. 2).

The PPNB cultural manifestations appear to solidify and expand on the earlier tenuous steps toward mixed agriculture that perhaps were begun in the late Epipaleolithic and PPNA. Since its definition at Jericho by Kenyon (1960: 47–57), the sedentary aspect of the PPNB has been found in a large arc covering Saudi Arabia, Jordan, Israel, Syria, and Turkey (Zarins 1989b: 30; fig. 1; fig. 2 here). The northernmost sites have been found on the Balikh and Khabur tributaries of the Euphrates (fig. 3; Copeland 1982; Cauvin 1972; Moore 1981; 1985; Akkermans 1988). The southernmost Euphrates sites appear to be Bouqras and Tell es-Souab 3, suggesting that rainfall farming could not be practiced further south. Recognizing the pattern, most archaeologists refer to a "Levantine" origin for this phenomenon. Moore (1979: 64) suggests a concept called "The Ancient Levant" (fig. 2) which included substantially all of Syria, western Iraq, most of Jordan, and a portion of northern Saudi Arabia. The researchers at Palmyra refer to PPNB sites there as part of the "inland Levant" (Fujii *et al.* 1987: 37).

The cultural characteristics of the period are well summarized elsewhere (Singh 1974; Mellaart 1975: 55–69; Bar-Yosef 1980: 127–30; Moore 1981; 1982: 9–16; 1985). The current article will briefly summarize the latest data on the subperiods.

After four seasons of excavation at ʿAin Ghazzal in Jordan, the investigators have subdivided the sequence into three specific phases: PPNB: 7000–6200 B.C., PPNC: 6200–5800 B.C. (also called Final PPN or PPNB final, Stordeur 1988; Cauvin 1981: 481), and the PN (Neolithic): 5800–5000 B.C. (sometimes called "Late Neolithic," Rollefson 1988;

Köhler-Rollefson 1988; Rollefson and Simmons 1988: 98–99; Kafafi 1987). Possible similar sequences may be found at ᶜAin Abū Neḥeileḥ in southern Jordan (Henry 1986), Kowm II in northern Syria (Stordeur 1988), and Al Aynah in Saudi Arabia (Ingraham *et al.* 1981).

Three major topics—climate, subsistence, and lithic technology—which relate to pastoral nomadism and can be recognized in the archaeological record are briefly examined here in light of the revised PPNB/C record. It seems clear that the PPNB/C was part of a climatic optimum that declined slowly and terminated in stages during the late third millennium B.C. (for the evidence, see Zarins 1989b and references). Mellaart (1975: 65) speaks of a "wetter phase" during the early part of that period which allowed the spread of PPNB culture into more marginal steppe sites such as Bouqras and Kowm. Moore (1979: 69) has postulated a major shift in vegetation zones between the beginning of the Natufian and the end of the PPNB. Others have suggested that the climate of southern Palestine was wetter during the seventh millennium B.C. (Horowitz 1979: 248; Danin 1985: 39–40;

table 1; Rosen 1987: 48–49). Work in the Palmyra basin has largely supported that theory (Sakaguchi 1978: 26, 109; 1987: 14; Fujii *et al.* 1987: 29).

Economically, according to Bar-Yosef, a radical change took place by the beginning of the period. However, while there is clear evidence of cereal and pulse domestication from the preceding PPNA, there is little evidence of domesticated animals at that time. Bar-Yosef (1980: 128) suggests that most of the earlier (wild) game had given way to a dominance of ovicaprids and bovids and that their domestication in later periods was not in doubt. Without clearly stating that the PPNB animals were domestic, he suggests that a drastic faunal change was evident at such sites as Mureybit, Abu Hureyra, Beisamoun, Jericho, and Abu Ghosh. The evidence of sheep remains at Jericho, found outside their natural habitat, also suggests a concerted conscious manipulation. Mellaart (1975: 65–66) feels that a loose association of gazelle and other ungulates with humans prevented intensive domestication during the PPNB and only the domestic goat could be placed in that category. A study of the fauna at Jericho convinced Clutton-Brock (1978; 1981: 56–57, 60–61) that domestic goat and sheep were present by the eighth millennium B.C. Moore (1979: 68) states that ovicaprids and gazelle were herded by the PPNB (see also Legge 1972; Garrard 1984: 126). Moore later (1982: 16) proposed that only ovicaprids were herded and that the innovation began during the PPNB (Moore 1981: 448, 456). Surely, however, the dramatic reversal of the relative percentages of gazelle vs. sheep/goat ca. 6200 B.C. in favor of the latter strongly argues in favor of

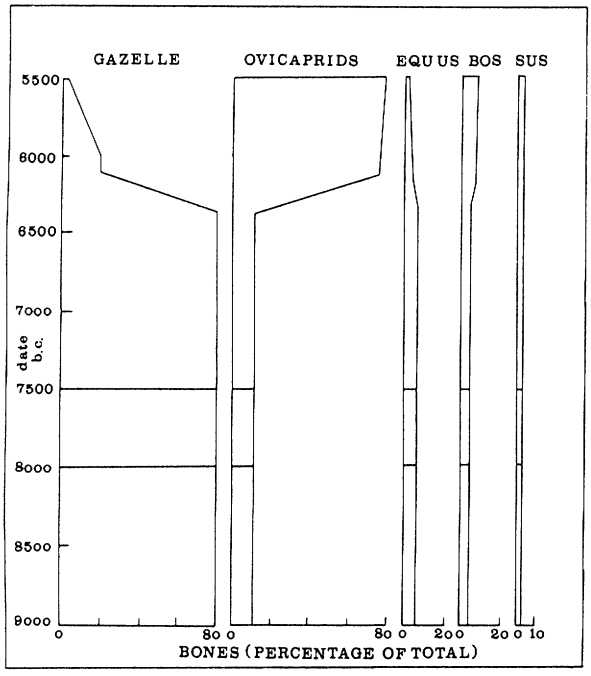

Fig. 4. Composite of total animal bones recovered from Abu Hureyra, Mureybit, Beisamoun, Jericho, Abu Ghosh, Bouqras, and Tell es-Sinn (after Legge and Rowley-Conwy 1987, Clason 1980, 1983, and Bar-Yosef 1980).

the introduction of sheep/goat animal husbandry by the PPNC (fig. 4). This reversal is paralleled at Balikh PPNB/C sites, such as Tell Assouad and Tell Sabi Abyad. The earlier levels at Tell Assouad contained a majority of wild animals but by the PPNC, domestic ovicaprids were dominant (Akkermans 1988). The same pattern for dominant ovicaprid herding in the PPNC is seen further north along the Euphrates at Hayaz Höyök (Roodenberg 1988). At Bouqras, contemporary to the last half of the PPNB at Abu Hureyra and thus part of the PPNC, the initial faunal identification suggested that ovicaprid remains predominated and that goat were "semidomesticated" (Hooijer 1966: 194). A recent study of new material from Bouqras notes the presence of domesticated ovicaprids and wild sheep (Akkermans *et al.* 1982: 57; Clason 1983: 361). At ᶜAin Ghazzal during the PPNB, herding domestic goats and hunting were equally important (Rollefson 1988: 4; Köhler-Rollefson 1988). In PPNC, goats were increasingly well represented and hunting declined (Köhler-Rollefson 1988). In addition to ovicaprids at Bouqras, domestic cattle were present in PPNC context (Clason 1979–1980; 1983: 361; Buitenhuis 1984: 213). They were introduced at Abu Hureyra, ᶜAin Ghazzal, Hayaz Höyök, Tell Abu Abyad and Tell Assouad at the same time (Legge and Rowley-Conwy 1987: 95; Rollefson 1988; Roodenberg 1988; Akkermans 1988). The distribution of animal domesticates in the Levant, coupled with other evidence (see below), suggests that the hearth area for much of PPNB animal husbandry may have been in the northern Syrian region just north of the Jezireh (fig. 3).

Lithic production was becoming more specialized during the period and exotic or highly desired flint sources were exploited as part of an apparent, long-range trade network involving the Mount Carmel area, central and southern Syria, and northern Arabia (Mellaart 1975: 65). Other long-distance trade items moving through Syria, northern Arabia, and the Levant included Vannic obsidian, alabaster, jadeite/greenstone, turquoise, and white plaster ware. The "markers" identified with lithic production include the distinctive biended cores (often called naviform or boat-shaped) and crested blades as byproducts that produced the desired long blades characteristic of the PPNB. Such blades sometimes exhibited pressure retouch and were turned into reaping knives, distinctive tanged projectile points (e.g., Amuq and Byblos points), endscrapers, sickle blades, borers, notches, and very commonly simple and transverse type burins (Mortensen 1970; M.-C. Cauvin 1972: 90–93; Mellaart 1975: 63; Moore 1982: 11; Rollefson 1988). This classic PPNB sequence can be tied to numerous other sites and the assemblages are most often identified on the basis of projectile points (fig. 5). For the PPNC, smaller projectile points occur although Byblos and Amuq points are still present. Burins are still dominant but truncation types become much more common (Table 2). Notches and retouched flakes occur in greater numbers and sickle blades disappear (Rollefson 1988). By the Pottery Neolithic, small bifacially knapped, tanged, and winged projectile points are common, as are truncation burins and large side scrapers (Gilead 1990). Tabular or cortical flint scrapers also appear (fig. 6; Rollefson and Simmons 1988: fig. 7).

THE STEPPE/DESERT PPNB

Several researchers view the steppe/desert south of the central Fertile Crescent as distinct from the settled zone, although the various ecological subgroupings of the region are usually more complex

than is generally realized (see Wirth 1958; Zarins 1989b: 35–36; Betts 1989; Betts *et al.* 1990: 1–4). In fact, PPNB materials were found outside the expected sedentary zone before similar finds at the Levant tell sites, but they were not recognized as such. Material was reported form Wadi Ahmar in the south Sinai early in the twentieth century (Currelly 1906: 229–44). In eastern Jordan and central Syria, explorers saw from the air large-scale enigmatic structures, Maitland's [1927] and Rees's [1929] so-called "kites" or Poidebard's [1934] "*enceintes fortifeés indigenes.*" Finds in Jordan, Syria, and Iraq remained unknown within the larger context of Levantine archaeology (see Field 1951: 89, n. 9; 1960; Rhotert 1938; Waechter and Seton-Williams 1938). However, by the 1940s, three distinctive categories of artifacts were known in this vast area: rock art, lithics, and structures.

Intensive work conducted since the 1960s in the Negev and Sinai, eastern and southern Jordan, and northern Saudi Arabia (see Zarins 1990) allows us to begin assessing similar material from Syria and Iraq. Based on work in the Negev, researchers have constructed a tripartite division of the PPNB based on knapping techniques, projectile point typology, and Carbon-14 dates (Bar-Yosef 1981a: 221, 226; Noy and Cohen 1974; Zarins 1990: table 1). Summary studies suggest a site typology based on site size, architecture, and lithic usage (Simmons 1981: 32–47; Goring-Morris and Gopher 1983; Baron 1981). In the Sinai, PPNB sites are known from both the north (Gilead and Goldberg 1976; Mintz and Ben-Ami 1977: 242–43) and south (Copeland and Hours 1971: 17; Goring-Morris and Mintz 1976: 138; Bar-Yosef 1981a; 1981b; Goldberg and Bar-Yosef 1982). It appears that many sites belong to the PPNC, a significant fact mirrored at Syrian sites (Bar-Yosef 1981b: 45). In the Azraq region of Jordan, a number of PPNB sites have been defined on the basis of stratigraphical association or surface concentrations (Garrard and Stanley-Price 1975–1977; Garrard *et al.* 1985; Garrard *et al.* 1987; Rollefson 1982: 26–27; Rollefson and Frohlich 1983). From Jilat 7, two Carbon-14 dates suggest a mid-seventh millennium B.C. date for the PPNB occupation (Garrard and Stanley-Price 1975; Garrard *et al.* 1988: 322).

Betts's five-year campaign in the eastern arm of Jordan has helped to define the steppe/desert facies of the PPNB/C and the PN. Work at Dhuweila, on the western side of the Harrat Rajil, revealed a two-fold sequence. The earlier PPNC occupation was dated to 6240 B.C. and represented a small camp composed of stone circles. The lithic assemblage on flint was characterized by the presence of naviform bipolar cores, projectile points of Beidha and Byblos type, and dihedral and truncation burins (Betts 1988b: 9). Recovered animal drawings on small basalt boulders (Betts 1987) are paralleled at other sites to the southwest, such as Kilwa (Rhotert 1938), and represent in secure context the early outline style associated with the PPNC. "Kites" of the region may now be safely dated to the PPNB/C period (Helms 1982: 101; Betts 1988a), especially the Byblos and Beiha projectile points (Parr *et al.* 1978: 36–37; Helms 1981: 46–47, fig. 23; Betts 1983: 9–10; 1985: 39; Helms and Betts 1987, figs. 15–16). At Ibn el-Ghazzi, northeast of Dhuweila, a conscious attempt was being made in the PPNC to control scarce water resources by channeling and impounding. That may be one of the earliest precursors to the more famous *seil* technique the South Arabs used centuries later (Betts 1988a; Betts and Helms 1989). The apparent southern limit of the PPNC sites is in north-central Saudi Arabia. Site 201–42 in the Wadi Arar drainage contains the usual PPNC materials (Parr *et al.* 1978: 36; pl. 39, nos. 46–54). Possibly the settlement, 206–36, found at Hail (Parr *et al.* 1978: 39; pl. 27b/c) and a kite south of the Nafud (206–6) may represent the southern early extension of the PPNC expansion. To the west, the southern PPNC line remains at Kilwa, where a recent resurvey has confirmed Rhotert's earlier work (Gilmore, personal communication).

The spread of the PPNC culture over the desert/steppe suggests the continuation of a mixed subsistence strategy, but one that also included some limited sheep/goat herding (Betts 1988a; Tchernov and Bar-Yosef 1982). At Jilat 7, in southern Jordan, the subsistence strategy for the earlier PPNB included hunting gazelle and other animals, domesticating cereals, and exploiting wild grasses in a pattern similar to that at ʿAin Ghazzal. At Azraq 31, by 6400 B.C. domestic ovicaprids complemented the previous dietary pattern (Garrard *et al.* 1987; 1988: 322). The use of kites to trap gazelle and equids suggests the eventual demise of large-scale game hunting and presages the introduction and dependence on specialized herding, i.e., pastoral nomadism.

Betts defined for the first time the relationship between the PPNC and the following PN period, a period poorly understood in the Levant itself until the discoveries at ʿAin Ghazzal. The PN (Stage 2) at Dhuweila has been C-14-dated to 5450–5030 B.C. (3 dates) and at Jebel Naja to 5480 B.C. (Betts

TABLE 2. Selected Significant Relative Frequencies of Burin Types at ʿAin Ghazzal

Burin Type	*PPN**	*PN**
Simple	2.2	5.1
Transverse	58.3	15.4
On Break	5.7	2.6
Canted Dihedral	3.9	20.5
Double	3.6	10.3
Concave Truncation	1.3	10.1
Convex Truncation	1.3	5.1
Combination	2.2	5.1

(After Rollefson and Simmons 1988: 102, Table 3.)
* Percent

1989). Two types of sites are attributable to the period. The burin sites have a high percentage of concave truncation burins (Table 2) and a few projectile points, usually either of the small bifacial or transverse variety (Betts 1988b: fig. 13; 1989: 5). The second site type has few truncation burins but more tabular scrapers, bifacial knives, and small projectile points (Betts 1988b: figs. 13–15). Such sites are widespread throughout eastern Jordan and much of Saudi Arabia (see Garrod 1960: 115–24). The burin sites however, appear more restricted to the northern portion of the Arabian desert. Betts's analysis of sites in the Burqu area [Sites 03000 and 02000] confirms the material from Dhuweila (Betts *et al.* 1990: 11–15). Faunal material from the Burqu sites, Dhuweila, and Jebel Naja suggests that ovicaprid herding dominated although hunting was still practiced. Sites tended to be located either along the *harra* or, as at burin sites, along deeply incised wadis where wide flood plains allowed adequate grazing (Betts 1989; Betts *et al.* 1990: 17–19). East of Burqu, Field reported similar sites in the Tellul al Basatin (Field 1960: Sites 62, 67, 69, 70, 72, 81). A rock carving at Dhuweila depicts humans holding hands or implements such as spears or *atl-atls* (Helms and Betts 1987: fig. 18–2; Betts 1987: pl. 1; fig. 2; 1988b: fig. 9–2); although Betts attributes it to the PPNC, it should, in fact, belong to the PN based on parallel scenes found at Milihiya near Hail and Jubba in the Nafud (Parr *et al.* 1978: pls. 28–31). The distinctive artistic style that involves packing or hammering out interior details is characteristic of the PN. For example, the depiction of cattle with pecked out bodies and distinctive profile found at el-Ghirqa in the eastern arm of Jordan (Betts and Helms 1987: fig. 5b) also parallels finds from numerous sites in Saudi Arabia, all probably dating to the PN as well (Parr *et al.* 1978: pl. 28b; Zarins *et al.* 1979: pl. 9a–b). Garrard, Harvey, and Switsur (1981) produced from the lake deposits at Jubba a single Carbon-14 date of 6685 ± 50 B.P., which places it in the PN.

In sum, by 6200 B.C. a recognizable PPNC culture had begun to penetrate the more "marginal" environments of the Near East, both south into the Negev and Sinai and east of the Levant into Jordan and Saudi Arabia. Evidence for that migration includes lithic materials, structural remains such as stone circles, circle complexes, kites, and in selected areas rock art. In contrast to the sedentary zone where the PPNB is seen as an early climax point after which many sites were abandoned and area reduced, the PPNB in the desert zone is the harbinger of a later climax; the population expanded throughout the Arabian peninsula in the following PPNC, PN, and Chalcolithic periods. In each succeeding period, the growing reliance on domestic herds at the expense of farming and hunting and gathering can be documented, thus demonstrating the gradual but inexorable shift to specialized pastoralism.

THE PPNB-PN STEPPE/DESERT CULTURES OF SYRIA AND IRAQ

The above discussion can provide a basis for examining similar materials from the Jezireh steppe of Iraq, Syria, and Turkey, and the deserts of southeast Syria and western Iraq. The Jezireh assemblages have not been examined for interaction patterns between the steppe and settled zones, and in the desert little work has been done since Poidebard's and Field's initial efforts. Beginning with the Jezireh (fig. 3), both survey and excavation have established a solid chronological range of materials for the sedentary communities to the north on the Euphrates, the Balikh, the Khabur, and northern Wadi Tharthar. Subsistence patterns clearly define a mixed farming/hunting-gathering strategy and the lithics are in the larger Levantine PPNB/C tradition. Several sites in the Jezireh were located on the frontiers of rainfall farming. The influence from the Levantine tradition may extend even to Hassuna. The lithic assemblage there contains several pieces in the PPNB Levantine tradition, including Amuq type projectile points (Lloyd and

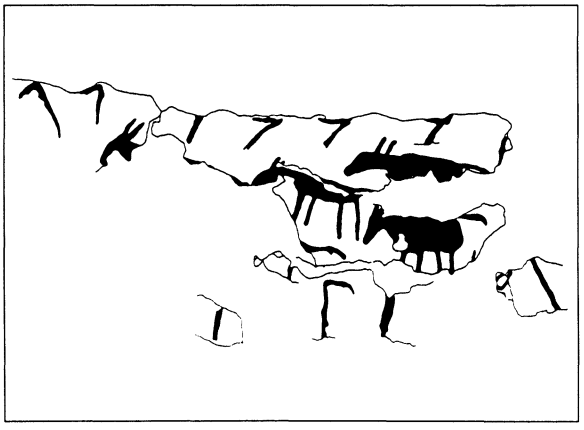

Fig. 7A. PN wall painting from Umm Dabaghiyah depicting an onager hunt (after Kirkbride 1975: pl. 7a).

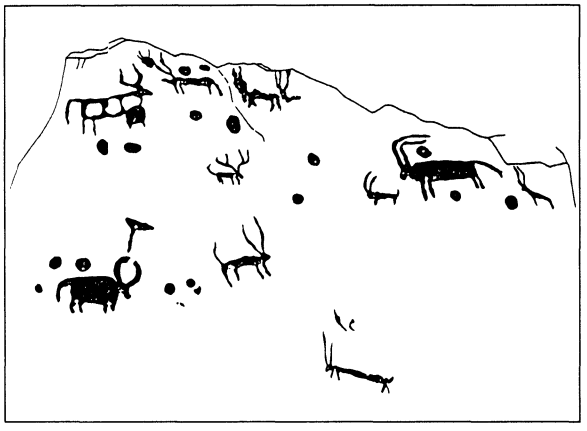

Fig. 7B. PN hunting scene at Qasr Muhaiwir, Iraq, using throw sticks and slings (after Tyraček and Amin 1981: 146, fig. 3).

Safar 1945: fig. 22:9–10), concave burins (Lloyd and Safar 1945: figs. 22:1; 24:2) and crested blades from core preparation (Lloyd and Safar 1945: fig. 23:1). Kirkbride (1972: 14; 1974: 86) describes Umm Dabaghiyah, Tell Sotto, and Tellul eth-Thalathat, in the heart of the Jezireh on the Wadi Tharthar as lying at the limits and completely marginal to the agricultural zone. Little has been recovered there in the way of agricultural products. "In fact, nothing indicates that agriculture played a significant role in the life of the villagers" (Kirkbride 1974: 88). Kirkbride suggests that most cereals and vegetables were imported. The zoological report suggests that although domestic ovicaprids and cattle were present (Kirkbride 1974: 90; Bökönyi 1973: 9), the inhabitants specialized in hunting, especially *E. hemionus* and ovicaprids. Those observations, despite the presence of an elaborate set of buildings, suggest that the inhabitants were already well on their way toward a specialized way of life for the Jezireh. The lithic assemblage also shows relationships to the western PPN tradition (fig. 6). The projectile points are of the Amuq type (Kirkbride 1972: pl. 18:2; Fukai and Matsutani 1977: 51, fig. 3:7–8). The early bifacial points and burins belong to the PN tradition (Kirkbride 1972: pls. 17:6, 18:5–6; 1973: 6; Mellaart 1975: 138, 141). There were a number of parallel sites in the region (Mellaart 1975: 140–41; Kirkbride 1972: 3). A final unique feature at Umm Dabaghiyah again has parallels to the west and the desert. A frieze found in one house complex (Level 3) depicts onagers being hunted). Kirkbride (1975: 7) interprets objects surrounding the animals as wooden hooks to hold down a net erected for capture. However, no net is actually shown and the objects can best be regarded as throw-sticks with parallels to the desert in the south (fig. 7a; also, see below).

Three other sites in the Jezireh define the effective southern frontier of dry farming along the region. Tell es-Souab 3, just discovered, is the southernmost site and little is known about its composition (Geyer and Monchambert 1987: 315, fig. 10). Bouqras and Tell es-Sinn lie outside the effective farming zone but their location on the Euphrates seems ideal for large-scale sedentary settlement (for the plan of Bouqras, see Akkermans *et al.* 1983: fig. 3). Carbon-14 dating suggests a time span of late PPNB/C and early PN (6400–5900 B.C.) at Bouqras, and the lithics contain the usual Amuq and Byblos points (Roodenberg 1983: 349, fig. 8). The common burins include the dihedral and truncation types (Table 2). Analysis of the palaeobotanical remains suggests that "crop plants were of little economic importance" since little area could be cultivated without irrigation (van Zeist and Waterbolk-van Rooyen 1983: 357, 359). In contrast, the "abundance of animal bones . . . seem[s] to indicate that animals were the main food source. . . ." (Clason 1983: 359). Domesticated ovicaprids and cattle were recovered; sheep outnumbered goats. Gazelle and wild sheep represented a distinct minority. Clason (1983: 361) concluded that people with animal herds came to a place "favorable for a pastoral mode of existence." Further north, some 30 km on the eastern side of

the Euphrates, Tell es-Sinn occupied a similar position both in time and space. Carbon-14 tests date the finds from 6700 to 6200 B.C. (Roodenberg 1979–1980: 26). The lithics contain a high percentage of projectile points, especially the Byblos type (Roodenberg 1979–1980: 25; figs. 4–5) and a large number of burins on truncation. Domesticated plants again form a very minor component of the site (van Zeist 1979–1980: 55–56), with wild plants predominating. Clason again found an abundance of domesticated sheep, goat, and cattle and concluded that plant cultivation was of little importance (Clason 1979–1980: 35–38). Examination of those sites of the Jezireh suggests that the steppe environment was marginal for farming but excellent for expanding herds.

A number of "kites," constructed game traps, have been reported across the Euphrates to the east and up the Khabur (fig. 3). Poidebard describes the concentration of more than 16 kites in a few select areas (Poidebard 1934: pl. 140). Seven were recorded near Jebel Čembe (Poidebard 1934: 153, pl. 145), one at Jebel Jeribe, and one south of Goseibi. Two were found just north of Khatuniya on the Wadi Frati; and three were reported on the slopes of Jebel Kokab just north of the Euphrates and south of Tell Aswad. The westernmost kite was seen near Jebel Gug, along the Thallaba–Tell Barti road (Poidebard 1934: 150). The northernmost kite to date was found at Tell Awan just north of Tell Brak (Poidebard 1934: pl. 140).

Southwest of the Jezireh, in the desert zone proper, a series of recent excavations and surveys at Kowm and Palmyra supplement and clarify Field's data from western Iraq and southern Syria. The Kowm basin (fig. 1), astride the route between the Middle Euphrates and the Wudyan region and the Al Hamada (including the Palmyrene), lies between Jebel Bishri and the northern Palmyrene massif. Four major tells in the region—El Kowm I and II, Qdeir I, and Umm Tlel 2—exhibit the classic characteristics of the sedentary steppe PPNB/C community and clearly ally the sites to Bouqras, Tell es-Sinn, and Tell Souab 3 on the Euphrates as well as the classic Levantine sites of the coast, e.g., Tell Ramad. The stratigraphy and Carbon-14 dates suggest that Kowm I, Qdeir I, and Kowm II were occupied in the early sixth millennium B.C. (Cauvin 1981: 472; Stordeur 1988). At Kowm I, the projectile points are of the Byblos type already seen in abundance at Jordanian and Syrian sites (Stordeur 1988: fig. 3; fig. 5 here). An unusually large number of truncation and transverse burins was also noted (e.g., at Qdeir I, Stordeur 1988: fig. 4; fig. 5 here). Nadaouiyeh 4 in the Kowm basin resembles many of the lithic scatter sites found in the desert phase of the PPNC and contains the usual Byblos points, burins, and scrapers (Cauvin 1981: fig. 7). Excavations at Kowm II revealed six major PPNB levels, and as at ʿAin Ghazzal, a continuation into the PNA (Stordeur 1988). The lithics again contain the usual Byblos points (Stordeur 1988: fig. 6:1) and the very high percentage (over 50 percent) of burins (transverse, angle, and dihedral types; Stordeur 1988: 20; fig. 6; cf. Table 2 here). Floral samples from the site suggest the presence of domestic cereals but with an emphasis on wild spectra as at Bouqras and Tell es-Sinn (Vaughan, cited by Stordeur 1988). Domesticated sheep outnumber goats but hunting was still considered very important. Wild animals, dominated by gazelle and equids, comprised between 40 to 50 percent of the recovered fauna (Helmer cited by Stordeur 1988).

Work along the now fossilized lake and stream beds of the Palmyra basin (fig. 1) has also added to our understanding of the region. The area has a rather dense occupation history for the PPNB/C (Sakaguchi 1978: fig. 2.1). Moore (1985: 20, fig. 1, 8) lists 13 PPNB sites around the lake area. While little material was found inside the Douara cave itself (Endo 1978: 80; Sakaguchi 1987: 9–10), the wadi fans in front of the cave yielded abundant PPNB/C material including naviform cores, crested blades, and tabular flint cores (Endo *et al.* 1978: 96–97). Surface surveys along the fossil lake Sabket Mouh have turned up a number of PPNB sites, clearly indicating an active lake phase in the region (Koizumi 1978: 47, fig. 3, 11; Akazawa 1979: 215, 219; Sakaguchi 1987: 14). Those sites, like Bouqras on the Euphrates, are found most often on terrace remnants; but here they consist of simple lithic inventories dominated by naviform core production, crested blades, and truncation burins (e.g., Site 35: Akazawa 1979: 177–86, fig. 13.9; Site 79: Akazawa 1975; 1979: 187–95, figs. 13, 13–14; Abe and Akazawa 1977; Suzuki and Kobori 1970; Suzuki and Akazawa 1971; Site 122: Fujii *et al.* 1987: 29–39). The overlap of the late PPNB tradition into the early PN is found at Palmyra at Site 64 (Akazawa 1979: 215).

For the remainder of the Syrian steppe/desert, the results are uneven. For the area of interest south of the Palmyrene range stretching to the Iraqi border, virtually nothing is known (fig. 1).

The topography is very similar to that found in western Iraq; the region has often been called "Al Wudyan," since a series of wadi systems flow into low-lying basins dominating the landscape, e.g., Al Qawa'ar, Miyah, Al Uwayrid, al Hayl and Dubbayah. West of that region, southern Syria forms a large rectangle with the Palmyrene range on the north paralleled by the Jordanian border. The southern end of the rectangle is marked by Jebel Druze. Within that area, partially dominated by the northern extension of the vast Harrat al Rajil (Helms 1981: fig. 27), a number of brief studies have taken place since the 1920s (Maitland 1927; Rees 1929; Field 1960; Poidebard 1934; Beaulieu 1944–1945; Braemer 1984; Buccellati 1966: 237, nn. 13, 14). Excluding the Kowm and Palmyra basins, our data base in Syria is restricted to surface material consisting of kites, stone circle constructions, and lithic concentrations.

Kites show a clear continuation of the material found in the Negev, Jordan, and Arabia. In Syria, they constitute perhaps one of the few reliable guide markers, having been spotted from an initial aerial perspective (Maitland 1927; Rees 1929; Poidebard 1934). Their distribution follows a southwest to northeast arc; the southernmost are around Jebel Druze and south of Safa, possibly at Jebel Seys (Poidebard 1934: 194, pl. 91:2). Note the kite cut by Wadi as-Saham at Nemara, Poidebard 1934: pl. 51; Rees 1929: 399). The kite mentioned earliest in the literature is "as-Sidd" at Dmeyr. It was described by Musil in 1908 (Musil 1928: 3–4, 7) and was photographed by Poidebard (1934: 43, 192, 194; pl. 14) and Legge and Rowley-Conwy (1987: 89). According to Watelin, kites also may have been located in the al-Hamada near Jebel Tinf (Poidebard 1934: 191–92). Following the lava scarp south of Dmeyr, Poidebard (1934: 194) describes another series of kites at Deir Semali and over ten more on the Wudyan plain from the Souhné area on the Jebel Rigm as-Saboun (Poidebard 1934: 77–78, pls. 48, 49). Watelin saw kites north of Soukné and south of Gdeihm wells (Dussaud 1929: 150; see also Helms 1981: fig. 27; Legge and Rowley-Conwy 1987: 91). West of Jebel Bishri he also found a series of kites between Resafa and Taibe (Poidebard 1934: 79, 191–92, n. 1; Legge and Rowley-Conwy 1987: 91; Helms 1981: fig. 27).

Other structures associated with the PPNB/C and PN remain problematic because no ground control has been exerted. Since work in eastern Jordan has strongly suggested that the stone circle forts and jellyfish complexes belong to that period, we can assume that similar structures in the Jebel Tinf area are contemporaneous (Field 1960: 52–54, 93; Poidebard 1934: 126). Watelin observed circle complexes in the Jebel passes between Jebel Bishri and Abu Rigmen (Dussaud 1929: 150) and Buccellati noted a number of such structures in the vicinity of Jebel Bishri (Buccellati and Kelly-Buccellati 1967; Buccellati, personal communication). Helms (1981: fig. 27) placed "forts" in the vicinity of Jebel Bishri, Jebel Tinf, and the Sinjar. Unfortunately, many of those structures may belong to subsequent periods. For example, Khirbet el-Umbachi and Hebariye, excavated in the 1950s, should be identified with the EB III/IV (Dubertret and Dunand 1954).

Diagnostic lithic material from those regions of Syria is also rare. Field traversed a small portion of southern Syria in the 1920s. On the route from Rutba to Damascus, he found typical PPNB/C and PN burin material from Wadi ash-Shalan just north of the Jordan–Iraq line (Sites 7, 16) and at Jebel Tinf itself (Sites 4, 12, 13). Those concentrations may be part of a major complex at Jebel Tinf—if they are associated with both nearby kites and structures. Further along the road near Maqha ash-Shami, Sites 102 and 103 also may belong to the nearby "circle village" (Field 1960: 139). More recent surveys in the Hauran region suggest that the PPNB/C and PN lithic sites may be associated with structural remains (e.g., at Taibe, Zelaf, Dera'a, and elsewhere; Braemer 1984: 224).

Finally, western Iraq has sites that clearly belong to the PPNB/C–PN tradition. The region, a continuation of the Wudyan topography of southern Syria, contains a series of eastward-flowing wadi systems into either the Euphrates or the playa lakes west of the river (i.e., Hawr Habbaniya and Abu Dibbis/Bahr al Milh) (fig. 8). As in Jordan and Syria, the westernmost portion of Iraq is characterized by smaller playa lakes (such as the Palmyra basin Sabkat Mouh) and occasional lava outliers of the Harrat al Rajil (Wirth 1958). Topographically, then, it is part of the larger Levantine landscape. Field reported at least 12 relevant sites in separate, rather random traverses of western Iraq between 1926 and 1928. They are clearly located on tributaries or main branches of wadis leading to the Euphrates. His westernmost sites, Nos. 15, 22, 25, and 30, are on the braiding stream bed known as Sha'ib al Walaj. That former watercourse apparently flowed north to the Iraqi–Syrian border,

where it turned east and merged with a series of wadis and lakes flowing into the Euphrates. To the northwest of Sites 25 and 30, geologists identified al Umchaimin crater, a large solutional caldera (Merriam and Holwerda 1957; Mitchell 1958). Analysis of the published aerial photo revealed several stone circle village sites, probably of the PPNB/C. On two small tributary arms of the Wadi Mullusi (classical Meloṣa), Field found Site 242. Other sites are now known from that wadi where it touches the Qa^{c}ara escarpment and merges with the Wadi Rutqah (Field 1951: 89; n. 9; Wetzel in Fleisch 1952: 214–16; Solecki 1955: 18; Tyraček and Amin 1981: 148, n. 1). In the extreme southwestern corner of Iraq, sites are found on several large wadi or lake tributaries, and the Ghadfat Ali Awaj and aj-Nuhaydayn (Site 77), both flowing into the Wadi Hauran.

Sites also have been reported on the Wadi Hauran itself, including Field's Site 36, Sugarloaf, 41, and 51 (Solecki 1955: 18; Field 1960; Wright 1958: 56). The most recently discovered is at Qasr Muhaiwir, approximately 125 km west of the Euphrates. The reports suggest that Neolithic finds along the Wadi Hauran are fairly common (Tyraček and Amin 1981: 148). A small tributary of the Hauran in the Muhaiwir vicinity, Wadi Hussainiyat (fig. 1), yielded abundant evidence of PPN and later materials, including lithics, ceramics, structures, and apparently graves (Hashimi and Skoček 1982: 32). South of Wadi Hauran, a parallel, major tributary, the Wadi Amiq, also has sites, one of which was approximately 150 km from the Euphrates (Watelin in Dussaud 1929: 150).

Much of the early material from the Iraqi sites is now in the Field Museum in Chicago. Garrod, in her initial study of the material in 1934, described it as belonging to the "Wualian" after the site of Umm Wual in Saudi Arabia (Garrod 1960: 118–19). She suggested the material had certain affinities with the "Tahunian" or the early Neolithic of Jericho. Her analysis and my reexamination of the material revealed that the assemblages were often dominated by an extraordinary high percentage of burins, especially angle burins (including simple, faceted, and multiple). Other finds included concave-ended blades, Byblos points, end scrapers, backed knives, steep scrapers, retouched flakes and naviform cores (Garrod 1960: 120). Those examples, together with tabular flint scrapers and T-shaped implements, suggest virtual identity with assemblages seen in large context from the Negev and the Sinai to the Sinjar (see also Fleisch 1952: fig. 2). Based on Carbon-14 dates and the stratified context at sites from both the desert and the steppe, it appears that the material from the wadi complexes of western Iraq dates to the PPNB/C and the early sixth millennium B.C.

ROCK ART

Rock art from western Iraq was described for the first time in 1978. Many localities were examined around the Qa^{c}ara escarpment and the adjacent wadis Mullusi and Aghari (Tyraček and Amin 1981: 148, n. 1). Two spots at Qasr Muhaiwir were photographed and drawn. In both cases gazelle and ibex are the most numerous animals depicted, but long-horned cattle are also present (fig. 7b). Analysis of the style (Tyraček and Amin 1981: fig. 3) shows virtually identical parallels to the more voluminous rock art known from north-central Saudi Arabia. In particular, the scenes from Iraq show clear parallels to the rock art from Jubba

Fig. 9B. PN rock art at Jubba, illustrating the pecking technique on bovids.

in the Nafud. The technique is common there of pecking spots on the cattle (fig. 9b) and other ovicaprids (Adams *et al.* 1977: pls. 12, 20; Parr *et al.* 1978: pls. 28–31); it is repeated in the Wadi Hauran as well as in Azraq art in Jordan (Helms 1981: 27, fig. 9; see also Courtenay-Thompson 1975). The presence of the "Jubba throw stick" in the Wadi Hauran scene (fig. 7b) shows parallels to many northern Saudi Arabian sites (fig. 10a) and also links the Wadi Hauran in style to the northern site of Umm Dabaghiyah (fig. 7a). In several Arabian drawings (figs. 9a, 10b), the implement is held by humans. Such drawings of animals and associated humans supports the contention that ovicaprids and cattle were known in the western desert of Iraq as well as throughout the "vast PPNB koïné" (Stordeur 1988). The materials gathered thus far date the rock art at Wadi Hauran to the late PPNB/PN. The earlier outline style at Dhuweila and Kilwa properly belongs to the earlier PPNB (Betts 1987; Rhotert 1938; Anati 1979: 29–35).

Investigations by Field and others since 1926 have confirmed that PPNB/C–PN sites existed in the wadi tributaries of the Euphrates. Unfortunately, nothing has been reported from a vast, unexplored region of western Iraq, but such materials have been reported as far south as the Wadi Arar in Saudi Arabia. A brief glance at major wadi and lake systems in the western desert promises to yield numerous sites along such wadis as Wadi Ghadaf and its western tributaries; Wadi Tubal flowing into a tremendous playa; and Wadi al Ubbayid, a known historical route into the Euphrates, which now terminates at Qasr Ukhaider. To the south, Wadi Arar

merges into Wadi Hamir. The traditional Darb Zubaydah pilgrim route in the Abbasid period follows the Wadi Khirr (among others) and it is on a tributary of this wadi that the possible southernmost PPNC/PN burin site was found at Linah in Saudi Arabia (Gilmore, personal communication).

To summarize, PPNB populations began to expand into the areas of the Near East often considered marginal to the Fertile Crescent. That expansion has been well documented in the Negev and Sinai; eastern Jordan; and at Kowm in Syria, where surveys and limited excavations have established some chronological reliability, artifact context, and relevant faunal and floral particulars. Structures such as kites and linked houses are at least partially contemporary to the lithic concentrations and rock art. Sites in southern and eastern Syria and in western Iraq have been less well investigated and their total distribution remains a matter of conjecture. A number of points suggest a close interaction between those steppe and desert sites and the Levantine region itself. The lithics (above) point to an astonishing similarity and contemporaneity. Obsidian, presumably from central and eastern Anatolia, was traded across the Upper Jezireh and the Euphrates (Akkermans 1988; Moore 1979: 67) to Umm Dabaghiyah (Kirkbride 1972: 10), Tell es-Sinn (Roodenberg 1979–1980: 25), Bouqras (Roodenberg 1983: 349), the Kowm complex (Cauvin 1981: 473; Stordeur 1988), and to Jilat 7 in southern Jordan (Garrard *et al.* 1988: 322). Obsidian at ʿAin Ghazzal (Rollefson 1983–1984: 244) and Nahal Hemar (Stager 1990) may show connections with the steppe–desert or with the Levantine coast distribution. Similarly, green Dabba marble used for beads and other purposes has been reported from Jilat 7 (10 km from the source), at ʿAin Ghazzal (Rollefson 1988; Rollefson personal communication), and as far north in the desert as Site 03000 at Burqu (Betts 1989;

All use subject to https://about.jstor.org/terms

Betts *et al.* 1990: fig. 10). At Nahal Hemar on the Dead Sea, it was found in beadwork, and green-painted wooden beads may have been imitations of the marble (Bar-Yosef 1985: 12, 28).

One of the most interesting network trade items appears to be the gypsum or plaster white ware. That material is known from the second half of the seventh millennium B.C. at a wide range of north Syrian sites in the Fertile Crescent (see Kafafi 1986: fig. 1; Postgate and Watson 1979: 153). The material also has been found at the Jezireh sites of Syria (Umm Dabaghiyah, Tell es-Sinn, Bouqras, and Kowm). Rollefson suggests its occurrence at ᶜAin Ghazzal points to interaction with social groups in Syria (Rollefson 1983–1984: 244). This white material also was found at Dhuweila in the Jordanian desert in PPNC/PN context (Betts 1988a: 11).

A final note on interaction patterns involves a truly astonishing detail. The ᶜAin Ghazzal excavators noted that a left foot fragment from one of the ᶜAin Ghazzal plaster human statues had six toes, a "genetic anomaly relatively rare among most populations" (Rollefson 1983: 37; pl. 4:3). Rollefson also noted a similar foot from the PPNB Jericho statuary (Simmons and Rollefson 1984: 394; Tubb 1985: 130; fig. 11b). More recently, a foot fragment recovered from Nahal Hemar also had six toes (Stager 1990). A reexamination of a rock art scene depicting a copulating couple at Kilwa (fig. 11a) reveals that one of the figures, possibly the woman, has six toes on the left foot; she may have six fingers as well (Rhotert 1938: pl. 22). Since we have suggested that the Kilwa style belongs to the PPNB, its close relationship to the PPNB of the Levantine settled zone is beyond doubt. These connections between the "settled" and the "steppe" clearly establish the fact of symbiotic relationship in the region and strongly argue that the pattern has been in existence since the PPNC/PN. It now remains only to establish the nature of the phenomenon and to apply it to the Lower Mesopotamian valley.

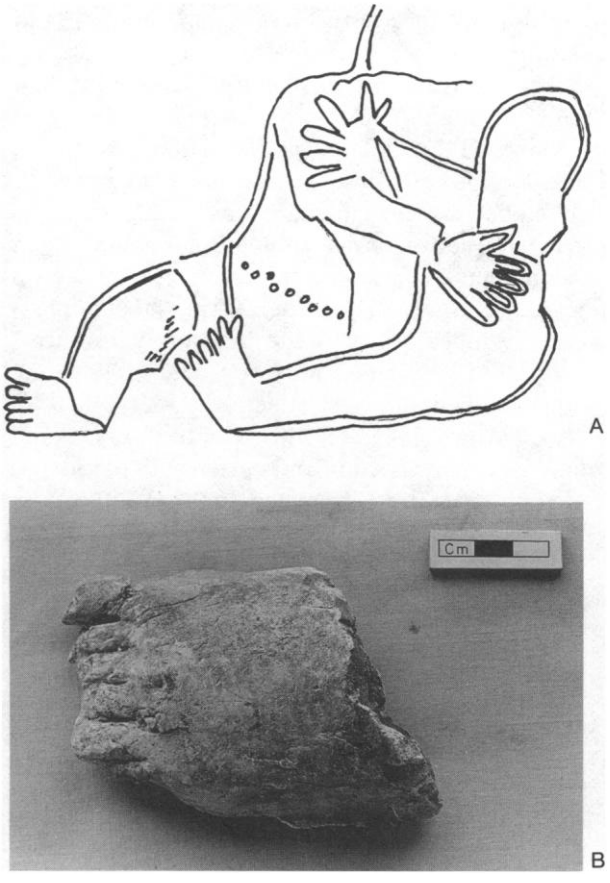

Fig. 11. A. PPNB/C rock art, copulating couple at Kilwa. Note the woman's extra toe on the left foot and possibly finger (after Rhotert 1938: pl. 22). B. Human plaster statuary fragment form PPNB at ᶜAin Ghazzal, Jordan. Note the six toes (after Rollefson 1983: pl. 4/3, photo by B. Byrd).

ORIGINS OF PASTORALISM

Anthropologists have long debated the definition of pastoral nomadism. Several recent syntheses (Dyson-Hudson and Dyson-Hudson 1980; Goldschmidt 1979; Johnson 1969; Khazanov 1984: 16–84) have suggested that all pastoral nomads share certain characteristics such as strong, localized kinship and lineage bonds, impermanent dwellings, movement to procure pasturage and water for herds, and specific relationships to formal states. Herd animals are viewed as the main form of subsistence although alternate strategies are also known (Lancaster 1981: 8–23; Lancaster and Lancaster, unpublished). Thus, pastoral nomadism seems to stress animal husbandry along patterned migration routes exploiting marginal environments (from a settled point of view). Developmental models studying pastoral nomadism have largely focused on the historical record (Khazanov 1984: 10–14; Ephᶜal 1982: 5–11; Briant 1982: 12–56; Lees and Bates 1974; Zarins 1989a), largely because researchers have concluded that a close symbiotic relationship exists between the urban, settled peoples and the nomadic peoples (Rowton 1973a; 1973b; 1974). In

All use subject to https://about.jstor.org/terms

addition, the lack of theoretical underpinnings has seriously hampered progress in defining the early stages of pastoral nomadism (see Khazanov 1984: 89–90). Sahlins (1968: 33), Krader (1981: 499), and Spooner (1971: 201) suggest that this adaptation was late and entirely secondary to agriculture. They conclude that the nomadic way of life only developed when extensive population pressure began in sedentary zones, together with dramatic crop strategies. Alternately, Sherratt argues that nomadism developed only with the "secondary products" revolution (exploitation of wool and milk) in the fourth millennium B.C. (Sherratt 1981; 1983; see also Garrard 1985: 45). More specifically, many have associated pastoral nomadism with the advent of the urban state (Lees and Bates 1974; Adams 1981; Rowton 1973a; 1973b), thus artificially restricting the study of the problem in lower Mesopotamia to the mid-third millennium B.C. and later.

The evidence, however, points toward a new interpretation. Pastoral nomadism began by the end of the seventh millennium B.C. as populations began to utilize the discovery of animal husbandry in a new and dramatic way. The process can be seen as a three-tiered step. First, based on faunal material found in the Fertile Crescent, we can conclude that domestic ovicaprids and cattle were present as early as the mid-seventh millennium B.C. Second, within the steppe region, as exemplified by the Jezireh sites and Kowm, herding was emphasized. That suggestion is based on the location of sites in a very low rainfall area (currently less than 150 mm annually) and the apparent domination of animals over plants in the economy. Third, if domestic animals were known to the inhabitants of the Fertile Crescent and the steppe, and the desert sites are chronologically contemporaneous or interrelated, the latter may represent early pastoral nomads who still exercised a broad spectrum approach for subsistence.

The picture of faunal reversal beginning at the PPNC supports these conclusions. As the faunal curves at Abu Hureyra and elsewhere suggest (fig. 4), a reliance on wild gazelle was almost totally replaced by one on domesticated ovicaprids. Legge and Rowley-Conwy argue that domestication of the ovicaprids within the steppe border area of Abu Hureyra was stimulated by the widespread killing of gazelles in the steppe and desert (using the kites of the early to middle PPNB). Gazelles could not migrate north in the summer season and now verged on extinction (Legge and Rowley-Conwy 1987: 95; figure, p. 91). The demand for meat protein was best met by domesticating ovicaprids rather than depending on gazelle; and forager groups in the desert turned toward the domesticated ovicaprids as an alternative food source. Several scholars have already suggested that pastoral nomadism began at that point (Cauvin 1981: 482; Helms 1987: 51; Moore 1981: 448; Betts 1989).

Although no faunal analyses have been carried out on sites from western Iraq or from southern or eastern Syria, the faunal profiles from such sites as Abu Hureyra and the dominance of sheep and goats at Bouqras, Tell es-Sinn and Kowm 2, point to incipient pastoral nomadism, as does the presence of ovicaprids and cattle in the desert sites.

Two other arguments can buttress the suggestions here. First, the substantial increase in site numbers and site sizes in the late PPNB in the desert and steppe seem strongly related to complex interactions between the nomads and the settled populations. Animal domestication may be one variable responsible for that increase. Indeed, the ʿAin Ghazzal–Jericho–Kilwa–Nahal Hemar link would argue for close interaction of the type suggested from the ethnographic record. Second, the appearance of numerous sites in western Iraq along watercourses that today are dry indicates both climatic amelioration during the PPNB (Moore 1979: 69; Sakaguchi 1987: 14; Fujii *et al.* 1987: 38) and the ability of a new way of life to sustain human existence in the region. It appears that late Upper and Epipalaeolithic populations in western Iraq and southern Syria largely abandoned the steppe and desert (Garrard *et al.* 1988; Betts 1988c: 373–76; Cauvin 1981: 481; Braemer 1984: 224). Therefore, the PPNB–C sites represent the initial resettlement that pastoral nomadism made possible. It is also intriguing to note that the succeeding period within the Levantine sedentary zone represented a considerable decline in fortunes (Rollefson 1988), but that most of the larger Arabian peninsula was occupied largely due to the exceedingly rapid spread of pastoral nomadism.

PREHISTORIC AKKAD

The "sudden" appearance of populations without any previous occupational history in the desert and steppe (or at least a hiatus of three millennia) raises the question of ethnic and linguistic identity.

This content downloaded from
202.47.36.85 on Tue, 26 Oct 2021 11:35:01 UTC
All use subject to https://about.jstor.org/terms

The Semitic populations identified as "Akkadians" (or Kishites, cf. Gelb 1987: 63; 1989: 124) were pastoral groups who migrated from the western desert or hamada sometime within a protohistoric Mesopotamian context. No available historical data clarify their condition in the late fourth and early third millennia B.C., although some possibly contemporary sites have been identified in the desert (Betts 1989; Zarins 1989b). The MAR.TU who succeeded the Akkadians are well known, principally from Mesopotamian texts beginning in the mid-third millennium B.C. Historical mention ties the MAR.TU occasionally to Jebel Bishri, the mountain massif just west of the middle Euphrates. It is sometimes referred to as their homeland (Kupper 1957: ix–xiv; Buccellati 1966: 236–42; Archi 1985a). Nonetheless, the names "Akkadian, Kishite" and "MAR.TU" are merely convenient terms for populations that had existed in the region since the end of the seventh millennium B.C. Therefore, the "layering" of Semitic populations in the alluvium must be more complex and older than previously thought (*contra* Frankfort 1943: 133).

Adams (1981: fig. 27) presents an informative summation of sites and watercourses of the Mesopotamian plain for the third millennium B.C. In spite of disclaimers—natural alluvium thicker in the north, changing methodology and greater present cultivation in the north (Adams 1972: 182–83; 1981: 155)—"Akkad" was distinct from "Sumer" in terms of population density, settlement size, and settlement strategy. Nissen (1988: 144) suggests that the plain is divided into two parts, "Northern and Southern Babylonia." He describes the northern plain as having more channelization and the Euphrates there as slow moving with little latitude to develop (see also Paepe and Baeteman 1978: 46–55, regarding Sippar). The southern part of the plain, less restricted and with much more amplitude, is crisscrossed by a braiding Euphrates. Control of Kish (and Sippar) was thus important from both an ecological and an economic perspective (Nissen 1988: 144–45). Therefore, whether one uses data from Adams (1972: maps 3, 4; 1981: fig. 27), Gibson (1972a: figs. 7–10), or Weiss (1975: 444, fig. 1), it is apparent that in the northern alluvium the sites are fewer, more linear in pattern, and less dense than in the southern alluvium, suggesting a distinctly different utilization of the plain. If we apply the historic term "Akkad" to define the northern alluvium, Abū Ṣalābīkh seems to lie clearly on the border. The site represents the frontier of Semitic influence to the south (Biggs 1981). In addition, the historical data from the third millennium B.C. indicate that the kings of Kish were Semitic and ruled over the northern part of the alluvium. The distinctive ecology of Akkad favored—as it does now—a dimorphic approach to society. In that way the pastoral populations and settled farmers and urban dwellers together created a unique settlement pattern in the northern alluvium (Rowton 1969: 311).

THE GEOMORPHOLOGY OF AKKAD

Conditions in Akkad in the prehistoric and protohistoric periods point to a similar pattern. Unfortunately, our understanding of the Euphrates and its tributaries during the period in question is poor (Adams 1981: 16, 61; Paepe 1971: 20–27; Paepe and Baeteman 1978: 37–56; Baeteman 1980: plan 1). In spite of assertions that the current Euphrates has existed in its present form since 8000 B.C. (Paepe 1971: 19–20; Boerma 1983: 362), the major tributaries that contain PPNC/PN materials in the western Iraqi desert debauched either on the central Euphrates itself (above) or a past course of the Euphrates running through the Hawr Habbaniya or Abu Dibbis (Voûte 1957). West of the current river, in the Ramadi–Karbala region, three of the western wadi tributaries flowed into a possible early Holocene bed of the Euphrates (fig. 8). In addition, both the Habbaniya lake and Abu Dibbis depression are arid land features characteristic of the larger Arabian peninsula; they also were active in the early Holocene, ca. 8000–3000 B.C. (Zarins, Rahbini, and Kamal 1982: 28, with references). Therefore, future research on the middle Euphrates and the tributaries immediately to the west should turn up PPNB/C–PN materials. All the major routes from the western steppe and desert wind into the area known historically as Akkad, while virtually no tributaries of any kind that have produced early identifiable materials lead to Sumer. That explains in part the lack of early archaeological materials from "Akkad." Those materials are more likely to be found west of the present Euphrates along the geomorphological features described above (see Voûte 1957: 136, 141). The problem, then, of interpreting a major western bed of the Euphrates in the early Holocene contemporaneous with the PPNB/C, is to reconcile that

channel with the evidence of the proposed Ubaid–ED Channel much farther east (fig. 8). In fact, several major channels may have existed in the early Holocene. Voûte (1957: 136) and Paepe (1971: 19) assumed that the westernmost (fig. 8) dated only to the late Pleistocene or Palaeolithic. It could, however, also have belonged to the early Holocene in its terminal phase.

Within the southern alluvium proper, the earliest identifiable sites are no older than the Samarra period (Adams 1981: 58; Vértesalji 1981) and they should date to the mid-sixth millennium B.C. Within Akkad itself there are no contemporary sites, but some should be found on the early Holocene western branch of the Euphrates (above). Around Anah at least six Neolithic sites have been identified (Abdul-Amir 1988: 107; fig. 1 here). No PPNB-type agricultural settlements of the Bouqras type have been found, so the Neolithic remains should fit the pattern found in the western desert. In addition, the sites cluster in the area leading from the Wadi Hauran region. The earliest sites in Akkad are Ubaid II/III as represented by Ras Al Amiya (Stronach 1962; Adams 1981: 58) and are datable to the early fifth millennium B.C. Large sites such as Tell Uqair (ancient Urum?) apparently peaked during the Ubaid period and were a focus of early settlement in the plain (Lloyd 1943; Steinkeller 1980; Green 1986). Kish existed during the Ubaid period (Moorey 1975: 101; Gibson 1972a: 111; 1972b: 115, n. 5) and may have been an important center already.

From the following Protoliterate period (ca. 3500–2900 B.C.) Kish was a large regional center (Gibson 1972a: 111, figs. 6, 26a; Moorey 1975: 101, 164) and is mentioned in the Uruk IV texts from 3200 B.C. (Green and Nissen 1987: 232; no. 297). Sippar is also attested from that period (Adams 1972: map 2; Walker and Collon 1980: 99, pl. 27:34). The site survey pattern of Akkad from the Ubaid–ED I is almost identical to that recovered from the later ED I–I/L periods. Again, in spite of the caveats expressed by Adams (above), prehistoric Akkad was already distinct from Sumer. The division may be expressed in the earliest available texts (KALAM, "Sumer"? vs. URI, "Akkad"?; Green and Nissen 1987: 232, no. 282 vs. 305 and no. 594). The prehistoric occupation pattern, like that of historical time, suggests a strong pastoral (Semitic) presence interacting with the settled population. Both have the same linear, less dense settlement patterns. That evidence correlates strongly with the arguments here from the steppe–desert to the north and west of the Akkadian alluvium. The suggestion for the Protoliterate period is confirmed by the occurrence of the term TIDNUM, the later MAR.TU tribal term, in the Uruk *Archaic City* List (above). The presence of the term so early in the historical record indicates that the pastoral–settled continuum described for the later third and second millennia B.C. was already established by ca. 2900 B.C.

Semitic pastoralists appeared in the steppe–desert and the alluvial fringe of Mesopotamia as early as ca. 6000 B.C. (cf. Kramer 1948: 160). In succeeding periods, both prehistoric and historic, they contributed in a major way to the settlement of Akkad. Their rise to political preeminence in the north may have begun in the Protoliterate period as the legends of the later Sumerian SKL so admirably expressed it.

ACKNOWLEDGMENTS

An earlier form of this article was presented at a symposium sponsored by the American Schools of Oriental Research in Chicago, 23 November 1988, and was initially published in Zarins 1989b. The current study expands considerably the historical documentation necessary to interpret the early Akkadian presence in southern Mesopotamia and attempts to link the very early archaeological record from the Arabian peninsula to the early pastoral symbiosis of the southern alluvium. The study has benefited from numerous colleagues who gave time and ideas. In particular I thank M. Civil, R. Biggs, and M. Cooper for providing relevant historical data, and G. Rollefson for the illustration from ʿAin Ghazzal. G. D. Young provided an advanced page proof copy of Gelb 1989. A. Betts supplied a number of unpublished papers, and D. Henry gave access to many of the unpublished Centre National de Recherche Scientifique talks on the PPNB given at Lyon in 1988.

Kanlıgeçit – an Anatolian Model of an Urban Center in Eastern Thrace: an Overview

Eylem Özdoğan

Abstract

The Early Bronze Age site of Kanlıgeçit in Eastern Thrace is evidently a very particular settlement, as it is the only excavated site in Thrace yielding evidence on the interaction between the Anatolian and Balkan cultures during the 3rd Millennium BC. The basal levels of the site reflects a typical habitation in accordance with the other Bronze Age sites in the Balkans, comprised of wooden-post structures in wattle and daub. Likewise, cultural assemblage of dark-colored coarse wares reflects the conventional material known from other Thracian sites. However, by mid-third Millennium, the settlement was re-designed, this time of mud-brick structures with stone foundations, displaying the features of Anatolian Early Bronze Age. The core area of the settlement by the stage is encircled by a wall, the slope of the mound is coated with a glacis, and within this walled area there are free standing megarons, as well as an open large courtyard. Noteworthy of this stage is the presence of typical wheel-made Anatolian pottery, plain or red-slipped. Among the significant components of the material assemblage of this stage, two clay figurines of Central Anatolian type and the extensive presence of domestic horse bones are to be noted. In Thrace the presence of a site replicating the Anatolian model of settlement raises a number of interesting questions that are difficult to answer. Even though it seems possible that the site of Kanlıgeçit represents a northerly expansion of the Anatolian model of urbanization, whether it is due to a colonial movement or a volunteering adaptation of the Anatolian system by a local group is far from clear. Nevertheless, it is possible to surmise that the rich sources of copper, approximately 30 km to the north of the site, in the Strandzha Mountains might have triggered this phenomenon. In this respect, lack of other excavated Early Bronze Age sites in the region stands as the main obstacle in resolving this problem.

Introduction

Kanlıgeçit is a small Early Bronze Age site in the centre of Eastern Thrace to the south of Kırklareli city centre. The settlement was founded on the terrace of a small stream, Haydardere, a tributary of the Ergene River. The region where the settlement is located, is an ecological transitional zone between the steppic environment of inner Thrace, and the forested Strandzha Mountains of the north; thus, providing an access, both for subsistence and obtaining raw materials from diverse habitats.

The Excavations at Kanlıgeçit have been carried out since 1994 by a joint team of Istanbul University and German Archaeology Institute, under the co-direction Mehmet Özdoğan and Hermann Parzinger. The excavations at Kanlıgeçit, were carried out together with the excavations at Aşağı Pınar, located in some 300 m farther to the northeast (Özdoğan et al. 1997; Özdoğan E. 2005). Aşağı Pınar, covers the time range from the Neolithic to the Chalcolithic period. The settlement was interrupted during 4th and 3rd millennium BC. We presume that the settlement during these periods has shifted to Kanlıgeçit. The site was discovered in 1980 during the surface survey of eastern Thrace (Özdoğan 1986: 36). During the survey the site was divided into three distinct settlements denominated as Kanlıgecit East (B 5/16), Kanlıgeçit West (B 5/17), Kanlıgeçit South (B 5/18). Hovewer, it is now understood that Kanlıgeçit is a large, extensive settlement of the Early Bronze Age. The excavation of Kanlıgeçit started in 1994 in what was then considered as Kanlıgeçit West displaying a hitherto unknown assemblage of distinct Anatolian Imports. Succeeding excavations focused on the northern site where a fortified habitation area; »the citadel«, had been recovered (Fig. 1). It became evident during these excavations that what was consid-

ered to be three sites was actually a single large settlement dispersed in a considerably large area, composed of a citadel, surrounded by a low-density habitation. The excavations continued until 2009, with intervals, focusing on the citadel, exploring the habitation area through 36 small soundings.

At present the citadel area of Kanlıgeçit is being redesigned as an open-air site museum (Fig. 2) (Arı et al. 2010).

Stratigraphy and Architecture

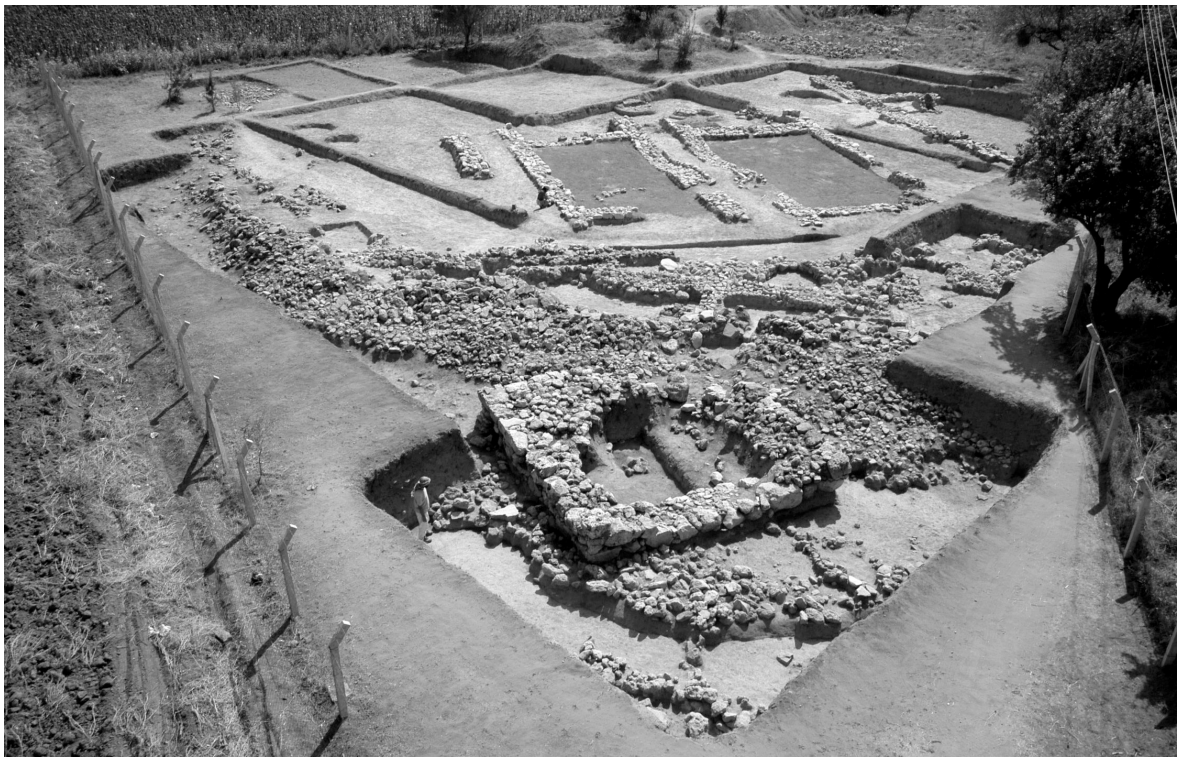
As noted above the site comprises of a central »Citadel« area and a loose textured habitation on the outskirts. Intensive surveys and soundings conducted around the citadel have revealed indications of the presence of late middle Chalcolithic, Early Bronze Age and Early Iron Age.

In the area of the Citadel, four distinct phases of the Early Bronze Age have been noted. Remains of earlier periods, namely late middle Chalcolithic, as phases 5 and 6 are known only from a number of pits exposed in the areas outside of the citadel. The characteristic features of the Pre-Bronze Ages pits reveal an assemblage, similar to those known from a number of other sites in Eastern Thrace such as Toptepe, Helvacı Şaban and Kocatepe, dated to the late middle Chalcolithic Period. The pottery of Phase 6 is easily distinguishable by dark colored unburnished wares, decorated with deeply incised decoration, bearing certain similarity to the Pre-Cucuteni assemblages of northeastern Balkans. The pottery of Phase 5 is highly burnished, light colored, presumably of early Gumelnitsa types. Also noted in the citadel area, were a number of late pits, designated Phase 0, revealing late Antique period. However, here we shall be mainly focusing on the Early Bronze Age sequences designated as phases 4–1 (Fig. 3).

Phase 4

The earliest Early Bronze Age level at Kanlıgeçit is Phase 4. Unfortunately, our knowledge of this phase is rather limited as it was only identified by a num-

Fig. 1: General view of the area, from north-west.



ber of restricted soundings in and around the empty areas by the monumental megarons of Phase 2. No major architectural remains of this phase was encountered; it evidently consists of wooden architecture with wattle and daub, as noted by some postholes. It seems possible that the settlement of this phase extends further to the north of our main exposure.

The pottery assemblage similar to the succeeding Phase 3, consists of dark and dull-burnished wares, though there are occasionally better-burnished sherds. Wares are mostly very coarse gritt tempered. Profiles are similar to late Troy I and to the contemporary Bulgarian assemblages.

Phase 3: Pre-Megaron Burnt Horizon

Phase 3, seemingly a direct continuation of Phase 4 is an architectural level destroyed by a heavy fire. Owing to the remains of burnt structures it became possible to document this architectural level in a considerably large area together with its assemblage. The upper part of the fill of this horizon had been destroyed as aresult of the leveling of the construction of the monumental architecture of Phase 2; evidently most of the deposition of this horizon had been leveled for re-designing the site. As noted above it became possible to view this phase only in unconnected exposures in between the megaron walls. All what was exposed consisted of long, rectangular, multi-roomed structures of wooden post-walls, with wattle and daub. Most of the buildings are about 7.5 × 5 m, oriented in north-south direction. The thickness of the walls is about 50 cm; in most cases they were well plastered. Occasionally, well-plastered floors, fireplaces and ovens were also identified. The building technique and the layout, like the pottery assemblage is highly reminiscent the of Early Bronze Age settlements of western Thrace. However, there are a number of features that are indicative of Troy I culture. Even though the buildings of Troy I have stone foundations, the parallel arrangement of the buildings at Kanlıgeçit strongly recalls the settlement design of Troy I. Likewise, there are some similarities between the pottery assemblages of Troy I

Fig. 2: General view of the area after the reconstruction.

and Kanlıgeçit; however, some of the main characteristic features of Troy I such as incurved bowls are absent at Kanlıgeçit.

In the relatively well-preserved buildings of Phase 3, a large number of *in situ* artifacts were encountered, indicating that the fire was unexpected. Among the finds, there are bone toggle pins, loom weights, sling missiles, spindle whorls, horn hammers, ground and-or polished stones, pottery vessels and animal figurines. Significant among the finds, are three clay human figurines (Fig. 4) of so-called »Bavurdu type«, indicating contact with Central-west Anatolia (Karul 2005).

The pottery of Phase 3 is mainly grit-tempered, dull black or grayish brown in color. Surfaces are either wiped or dully burnished. Fine wares are light buff or dark colored. The vessels are mainly in shapes of jugs and bowls (Fig. 5). Even though there are in-turned and/or carinated profiles they are notably different from those of Troy I. It is possible to say that the pottery assemblage has similar characteristics as the contemporary assemblages from Bulgaria. On the other hand, in general, the vessel forms and the finer wares are not too different from the Early Bronze Age I -II cultures from west-central Anatolia. This implies that even at this stage Kanlıgeçit had cultural connections with inland Anatolia and Eastern Bulgaria, and not specifically with the Aegean region.

Phase 2: The Megaron Phase

Phase 2 represents the period of a total renovation of the Kanlıgeçit settlement; the central part of the settlement was redesigned and modeled as a »Citadel«, strongly duplicating the so-called Anatolian Early Bronze Age town model. Within this phase there are at least three sub-phases, designated as 2a the youngest and 2c as the earliest. The distinction of

Fig. 3: Plan of the »Citadel« (orange and yellow are Phase 2, blue is Phase 1).

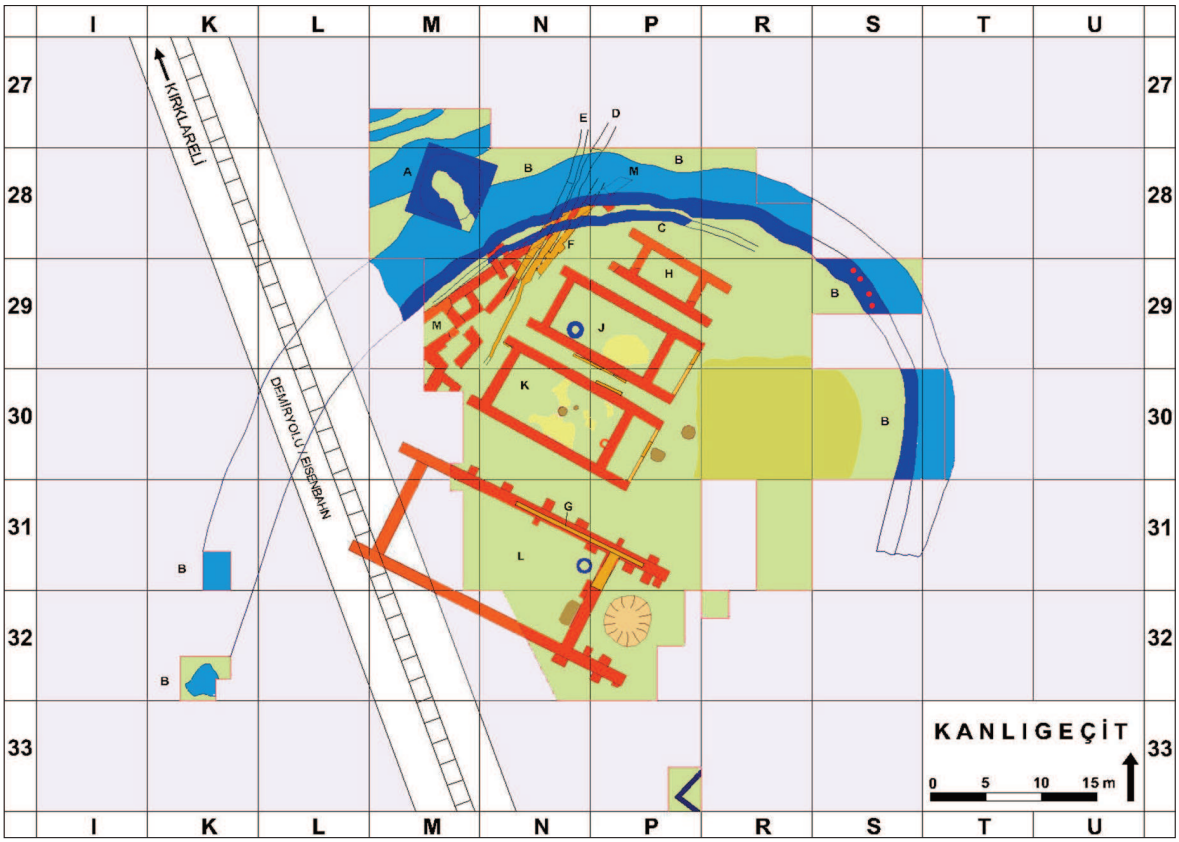


Fig. 4: Clay human figurine from Phase 3.

the sub-phases primarily reflects the three distinct renovations in the architecture, also, at the same time, reflecting changes in the pottery assemblage. The presence of Anatolian pottery begins in sub-phases 2c and gradually increases in time, however without any notable break among the sub-phases.

The buildings of the earliest sub-phase 2c are entirely of mud-brick without stone foundations; the buildings are rectangular in plan and are notably different from the wattle and daub structures of the earlier phases. From sub-phase 2b on all buildings are of mud-brick neatly laid stone foundations.

Sub-Phase 2c: The First Rectangular Mud-brick Structures

The deposit of sub-phase 2c is rather thin, as it had been leveled during the construction of the big megarons of sub-phase 2b. However, it thoroughly exemplifies how the architectural tradition of the settlement changed. The first clear indications of Anatolian impact are to be seen, by these sub-phases, as revealed by the use of rectangular mud-bricks and the presence of wheel-made vessels. Among the significant Anatolian type of pottery are the handmade and/or wheel turned plain and red-slip wares (Fig. 6). Nevertheless, the Anatolian pottery comprises less than 20 % of the pottery assemblage, the rest being exclusively of local wares that continued on from the earlier phase.

Our knowledge of the settlement organization of the citadel during this sub-phase is not very clear, due to the intensive remodeling during the sub-phase 2b. However, it is clear that the eastern sector of the citadel was reserved and arranged as an open courtyard. Within this open area, there are a number of oval pits with thick clay walls and on its southeast sections a number of domed ovens on raised platforms. Evidently, on the western section of the citadel, there were some free-standing rectangular buildings; however, whether or not they were like the later megarons of later phase in plan is not clear.

Sub-Phase 2b: The Main Megaron Phase

The architecture of this sub-phase is preserved only in the central area of the citadel. During sub-phase 2a, the northern parts of the citadel of sub-phase 2b had been totally destroyed during the construction of the enclosure wall. On the other hand, the southern part of the citadel had been eroded, leaving no structures of sub-phase 2b. Accordingly, this sub-phase had an enclosure wall like that of sub-phase 2a. The architecture of sub-phase 2b is represented by four megarons that have been aligned in a row in the southeast-northwest direction (Fig. 7). The area on the eastern side of the megarons, as in sub-phase 2c was reserved as an open yard; again with clay plastered oval pits and open or domed ovens. The layout of the megarons clearly indicates that the settlement was built according to a certain plan.

The first megaron on the north is only partially preserved; the recovered part of its southern wall is 10.4 m long. The second megaron measures 14.35 × 6.30 m. It has antes on its both ends. The clay flooring of the megaron is partly preserved in the southeast corner. This megaron has at least two renewal

Fig. 5: Vessels of phases 2 and 3.

phases, the latest possibly, dating to sub-phase 2a. During this renewal, the eastern ante was closed with a stonewall.

The third megaron measures 15 × 7.25 m. It has clay coated flooring preserved in the eastern section of the main chamber. Like the other megarons, it has been destroyed by fire. Among the burnt debris on its floor, there are the fragments of some structural elements such as an oven and a hearth and also some bin fragments. It is evident that there was a round hearth in the middle of the megaron. A most interesting recovery within the burnt debris on the floor was the skeletal remains of 3 individuals; whether or not they were caught in fire during the destruction of the megaron or whether they were imbedded there intentionally is not clear.

The southernmost megaron is somewhat different from the others. Firstly, it is much bigger and secondly there are external buttresses. The buttresses along its long walls are placed at 2.5 to 3.20 m intervals. The western part of the megaron had been destroyed during the construction of the Babaeski-Kırklareli railway; however, its southern long wall was preserved to the length of 27.5 m indicating that the original dimension of the megaron would be at least 27.5 × 11.2 m (Fig. 8). The thickness of the long walls are about 1 or 1.10 m. The floor of the structure was not preserved, but evidently the building had two rebuilding phases, the later one, might have been constructed during sub-phase 2a.

A large pit with a diameter of 4.5 m, which evidently had a ceremonial function, was found in the center of the east ante of the big megaron. The pit is about 2 m deep, with indications that it had multiple stages of use. Within the pit, particularly on its upper deposit, large amounts of Anatolian pottery of the finest quality were found. Also, notable in the pit, are a number of horse skull fragments. The contents of the pit are difficult in revealing its function. Besides the pottery of finest quality there were also large amounts of local coarse and fine pottery. Among the particular finds recovered in this pit there is a fine bone toggle pin, a stone weight, two pressure flaked arrowheads, a decorated bone fragment, some spindle whorls, few complete vessels and a few other bone implements. In par-

Fig. 6 Red slipped burnished plates from Phase 2

ticular the arrowheads and the toggle are of excellent workmanship.

To the west and northwest of the megarons, parts of another buttressed wall were recovered. This wall was preserved to the length of 23 m, and it resembles the long walls of the big megaron. Hovewer, association of this wall with any structure could not be detected. We might assume from other preserved wall fragments in this area that this buttressed wall might have been a part of a large and monumental residential unit. The presence of fine quality of import sherds in this area supports our interpretation.

Phase 2a: Late Megaron Phase

During this sub-phase, there were some renovations; the area around the megarons was surrounded by »temenos walls«. Even though the main megarons of sub-phases 2b continue, there were some slight modifications, such as the closing of eastern antes. What was denominated as the temenos walls was best identified to the west of megarons running parallel to their western ends at a meter a part. However neither the northern nor the southern extensions of this wall were recovered. Nevertheless, this wall was renewed with slight modifications in its orientations at least three times.

The dominant type of pottery of Phase 2 are the local coarse or medium coarse wares, mainly in dull shades of dark colors, smoothed or slightly burnished surfaces; still finer wares with buff, brown, gray or black surfaces, some with ribbed tubular lugs or strap-handles. This assemblage seems to be similar to all other Early Bronze Age settlements in Eastern Balkans. On the other hand, in sub-phases 2a and 2b there are some black burnished fine wares, notably different from the traditional Balkan pottery, displaying characteristics of West Anatolian types. Unfortunately, secure deposits of sub-phase 2a could not be recovered.

The typical Anatolian red-slipped and/or wheel-made plain wares, as well as the so-called »Trojan Plates« mostly appear in the lower deposits of Phase 2, that is to say, in sub-phases 2c and b. As no secure of sub-phase 2 had been recovered. Our knowledge

on the transition between phase 2 and 1 is not clear. However, as red slip pottery is extensively found in Phase 1, it is possible to infer that it became common in sub-phase 2a.

Notable among the Anatolian imports of Phase 2 are plain plates, two handled tankards, jugs with raised rims, black burnished bowls with incurved rims and tubular lugs. The early appearance of wheel-made pottery in sub-phase 2c such as beaked spouted jars and lustrously burnished wares though rather rare, is significant.

Phase 1: Destruction Phase

During this phase, the site has been significantly modified: a part of the eastern section was cut away and refilled to obtain a sloping edge encircling the citadel. This sloping edge of the mound was coated with stones to construct a glacis (Fig. 9). Particularly in the eastern section of the citadel there are indications of an artificial fill of yellowish clay soil. The newly shaped mound, during this phase was an enclosure or a defensive wall, raised above the glacis. Our knowledge of the central part of the citadel is extremely limited. Deposits of this phase lying above the megarons had almost completely been removed by recent agricultural activity prior to our excavations. The enclosure wall of this phase had been terraced through a length of 50 m of flat stones as an alignment above the glacis, thus, constituting the foundations of a mud-brick wall. Both the glacis and the enclosure wall had at least two major renovation phases. The presence of some big post-holes along the wall strongly suggests the presence of a wooden palisade along the mud-brick construction.

On the northwestern side of our exposure, associated with the glacis there is a massive stone structure, measuring 6.40 × 6.40 m, in places preserved to a height of 1 m. It seems possible that this structure was the foundation of a tower-like construction, possibly part of the main entrance, as a gateway bastion to the citadel (Karul 2002). The presence of an entrance at this location is also indicated by the remains of a ramp immediately to the west of the tower. However, its western part has been destroyed

Fig. 7: Second and third megarons of sub-phase 2b, from east.

by the railway. The tower-like structure was built of large ashler limestone blocks; and the outer faces were well dressed.

The pottery assemblage of this phase consists of fine wares with metallic luster; there is a significant difference in the fine wares from the earlier phases. On the other hand, the coarse wares have the same characteristics as those of the earlier occupation levels. Most of the fine wares are red or reddish brown, slipped and burnished; however, they have a much more metallic luster than the earlier ones. Occasionally there are jet-black burnished sherds of fine vessels with metallic luster. Some brownish-buff sherds, mostly with a patterned burnish, which is similar to Trojan »tan ware« were also recovered. It is also worth mentioning that the pattern burnished decoration also occurs in eastern Marmara region during this time period. Among the metallic wares there is the extensive presence of large storage vessels, most of which were recovered on the talus of the glacis presumably washed down from the slope. This implies that there was a big storage capacity in the citadel. In spite of the presence of Trojan tan wares, most of the pottery is notably different from Trojan and other Aegean assemblages bearing similarities to those of Central Anatolian pottery of the very end of the 3rd millennium BC. The extensive presence of domestic horse bones throughout phases 2 and 1 strongly suggests that Kanlıgeçit was connected to the trading network of Anatolian peninsula (Özdoğan 2003; Özdoğan and Parzinger 2000).

Epilogue

Kanlıgeçit at present is the only excavated Early Bronze Age site in Eastern Thrace; with the exception of Menekşe Çatağı located along the coastal strip the Sea of Marmara. Menekşe Çatağı had revealed typical Early Bronze Age assemblage of northwestern Anatolia with no particular features suggestive of long-distance trade. In this respect Kanlıgeçit stands as a significant but at the same time an odd site reflecting Anatolian urban models, though in a smaller scale (Özdoğan 2003). In this respect it is also different from the other excavated

Fig. 8: Southernmost megaron of sub-phase 2b, from south.

Bronze Age sites in Bulgaria. The impact of Anatolian model is not only restricted to the presence of import wares; the entire lay-out of the citadel, likewise the employment mud-brick megarons with stone foundations are all alien features to this part of the world. Even though in western Thrace and elsewhere in Bulgaria, there are a few typical Anatolian import vessels, such as the depas and a hoard find of Galabovo, no other site bears the characteristic features of Kanlıgeçit. What this implies is difficult to say at present; whether Kanlıgeçit represents a colonial expansion of the Anatolian model during the second half of the 3rd millennium or whether it stands as an acculturation or an adaptation of Anatolian way of living by a local group, is not clear. This can only be clarified as more Early Bronze Age sites excavated in the future. Nevertheless Kanlıgeçit was destroyed by the turn of the 3rd millennium to the 2nd, and throughout the 2nd millennium BC, no further settlement or any indication of Anatolian contact are to be found in eastern Thrace.

Fig. 9: Defensive wall raised above the glacis of Phase 1 and megarons of Phase 2c.

Troy has been of outstanding importance for Early Bronze Age archaeology ever since the discovery and excavation of the site by Heinrich Schliemann. Partly due to the paucity of archaeological research on EBA Anatolia, Troy has long been considered as the only key site for Western Anatolia and the Northern Aegean. However, as a result of recent excavations at other contemporary sites, it has become clear that Troy was not the only significant EBA settlement in this region and that its position as a key site is due for a re-examination. To explore the similarities and diversities of EBA cultures across the Northern-Aegean and Western Anatolia, an international conference entitled »Early Bronze Age Troy: Chronology, Cultural Development and Interregional Contacts« was held in early May 2009 at the University of Tübingen. Besides the general aspects of chronology and stratigraphy, it addressed themes such as the emergence of stratified societies, concepts of EBA economy and trade, production and distribution of raw materials and craft specialization with special reference to Troy itself.

PHOENICIAN COINS AND PHOENICIAN EXPLORATION

Prof. Dr. Mark A. McMenamin

Summary

Numismatic evidence favoring the hypothesis of a Carthaginian presence in North America has recently come to light. The evidence is twofold. The first piece of evidence consists of a particular group of early Carthaginian gold coins (called staters) that bear a map (derived from modified Punic letters) showing both the Old World and the New World. Going from east to west, the maps show India, the south coast of Europe above Sardinia and Sicily, and America.

The second piece of evidence consists of a series of seven or eight copper coins found scattered across North America from Nebraska to Georgia to Connecticut. The coins have an image of the Punic horse, the Phoenician palm tree (uprooted as if to be transplanted) and an enigmatic inscription in the Punic language. It seems unlikely that these coins were brought across the Atlantic in modern times, and if authentic they suggest a Carthaginian presence in ancient America.

Taken separately, these pieces of evidence could be dismissed as some type of fluke or hoax, respectively. But taken together, along with the fact that Carthaginian gold and base metal coins were reported from the Azores in 1778(1), the available evidence suggests that the Carthaginians had the ability to cross the Atlantic at will.

The Carthaginians were the western tribe of the Tyrian Phoenicians. The awesome abilities of both Tyrians and Carthaginians as seafarers left such an impression on the ancient mind that rumors have circulated ever since on the subject of exactly how far the Carthaginians reached with their ships. Peter Whitfield, although he accepts Herodotus' account of the Phoenician circumnavigation of Africa in 600 BC, says of the Phoenicians that "of their science, geography and chartmaking, if any, we know nothing . . . and as far as we can tell formal cartography played no part in their maritime achievement(2)."

The recent discovery of Tyrian deep water shipwrecks dated to 750 BC, complete with intact ceramic jugs and amphorae, promises to provide us with more information about Phoenician trade and exploration(3). This is a fortunate development, because, apart from Phoenician coinage(4), there are indeed comparatively few well preserved relics

of Phoenician civilization. When Carthage was defeated in 146 BC, most of Phoenician literature, architecture, geographic knowledge (which Phoenicians were secretive about to begin with), and that hard-to-define-something we call 'style' was lost forever.

Or was it? In 1996 I argued that Carthaginian gold staters minted in 350 BC contained tiny maps of the Mediterranean world(5). I further claimed that these small maps ("worldcards") included cartographic representations of India and the Americas(6). These claims led to a heated controversy, culminating in the publication of an image of one of the coins with the pattern of interest on the cover of the magazine Mercator's World(7).

I was first drawn to this problem by curious markings in the reverse exergue, underneath an image of the Carthaginian horse, on gold staters of Group IIIa of Jenkins and Lewis(8). The hitherto problematic markings in the exergue field of these coins are discussed by Müller(9) and Jenkins and Lewis. Müller claimed to be able to read the inscription as:

ha.lh

Müller (p. 126) explained the letters as two abbreviated personal names, which he interpreted as the initials of Carthaginian moneyers(10):

> . . . two groups of letters, separated by a point, are set off in the exergue. So far as it is possible to discern them, the characters, which are very obscure, read: ha.lh; the two letters in the middle are tilted toward one another, a result of being squeezed into the tight space of the exergue. This legend, similar to analogous legends of the coins of Sabrata (see p. 27-28 and 33), undoubtedly represents two abbreviated personal names, such as the names of two suffetes (Carthaginian senators) or the names of two magistrates/moneyers; the latter would appear to be the most probable on account of the small size of the letters. [my translation from the French]

Jenkins and Lewis were able to rule out Müller's 1860 hypothesis on the grounds that the Punic letter h in this form (i.e., shaped like a Russian "ya") is found only in Neo-Punic and does not appear in inscriptions until the first century BC. Jenkins and Lewis(11) were nevertheless frankly puzzled by the inscription-like patterns:

> . . . not the least baffling aspect of it is that the letters, if treated as such, are so extremely hard to interpret: the whole thing seems quite unnecessarily obscure by comparison with the inscriptions on other Punic coins of the same date . . . .

Alexander MacGregor, Jr. of the Department of Classics, University of Chicago reinterpreted the exergue pattern as the Phoenician letters aleph-resh-tsadhe ("aratz"), which means "homeland" in Phoenician(12). Unfortunately, this explanation does not apply to known specimens because more than three letters are visible in their exergue patterns.

The exergue pattern varies widely, but there are elements in common from coin to coin, such as the centrally located dot in the middle of the pattern. In an attempt to test the map hypothesis against the inscription hypothesis for these coins, in April 1999 I visited the student room of the British Museum Department of Coins and Medals (the repository of most coins of this type). Examination of the Carthaginian gold and silver coins in the British Museum collection provided a good deal of new information, but I still had no definitive answers. Later, however, it became clear that the exergue pattern I was examining on the gold staters was indeed an inscription in the Punic language, although one that had not been correctly interpreted for some 2,000 years. A close look at stater Jenkins-Lewis 6 (J-L 6) had revealed the Punic word qrthdsht, meaning "New City" or "Carthage(13)."

The Punic letters in most of the gold staters have been contorted almost beyond recognition, but by comparison with some of the early Carthaginian silver tetradrachms (British Museum Carthage PCG III C. 40 AR, R4835/32, PS 061565 and British Museum Carthage PCG III C. 40, PS 197869; both SG(14) 6427), the exergue pattern in J-L 6 can be read as qrthdsht, or "Carthage" (Figure 1; note that Punic is read from right to left and lacks vowels). The text element that proved to be key in this case consisted of the two short vertical strokes tilted to the left and positioned to the left of the central dot in the exergue pattern of J-L 6, a gold stater Group IIIa of Jenkins and Lewis. The two vertical strokes on the gold coin correlate well with the (more centrally located) vertical strokes on the silver coin inscriptions. The vertical strokes in both the gold and silver coins represent the Punic letter h. The central dot in the gold stater exergue pattern thus appears to be a modified right cross-bar in the Punic letter t.

The inclined strokes forming a Punic h are also seen in gold stater J-L 8-3, but they are smaller and the overall exergue pattern in this coin is more stylized. The Punic t at the end (left side) of this inscription has been modified into the shape of an eye. This t also has a central dot, which seems to serve as the pupil of the eye. Very interestingly, a later coin in the gold stater series (J-L 22) lacks an inscription but has the eye(15) (this time lacking a pupil) in the same position as the eye/letter in coin J-L 8-3.

Note that all of the coin inscriptions or patterns shown in Figure 1 are (with one exception) placed in their proper age sequence from 410 BC to circa 350 BC. The beginning of this date series is extremely well established due to the efforts of numismatist G. K. Jenkins.

While viewing coins in an auction catalog in the 1970's (Bank Leu Auction 2 of 1972, lot 2.69), Jenkins(16) noticed a Greek (Akragas) tetradrachm struck over another coin. Jenkins realized that the undertype was an early Carthaginian silver coin, a beautiful type (SG 6426) with, on the obverse, the forepart of a prancing horse being crowned by Nike, both to the right, a single barleycorn in the field to the right, and the Punic inscription qrthdsht ("New City" or "Carthage") below. The reverse has a symmetrical date palm with two date clusters, flanked by the inscription mhnt ("The Camp"). Jenkins was able to

Table 1			
No. Pellets	J-L/TCWH I Numbers	EXERGUE PATTERN	EXERGUE LINE
1	5/2	unclear	single
2	6/3	qrthdsht	double
	11/12	map; sh may be visible to left of central dot	single
	12/13	unclear	single
3	7/4	unclear	single
	13/14	map	single
4	8-2/6	map	single
	8-1, 8-3, 8-4/5, 7, 8	qrthdsht for 8-3/7; others unclear	single
	10/11	map	single
5	4/1; "soft serve ice cream" forelock curl	map; sh may be visible to left of central dot	double

detect this coin as the undertype because he noticed that a date bunch was visible on the front overtype horse's flank and parts of its main, and that the bridle and topknot from the Carthaginian horse and Nike's belt appear on the front eagle of the Greek coin. Jenkins was able to use this juxtaposition of types to date the Carthaginian coin to approximately 410 BC. Jenkins received compliments from his fellow numismatists(17) for his sharp eyes. To provide a relative dating method for the gold coins, I assume that coins of Group IIIa with fewer dots or pellets on the reverse were struck earlier, and that those with greater number of dots on the reverse (as many as five dots are known) were stuck later in the Group IIIa series. This seems a reasonable method(18), for the count of reverse dots has proved a reliable dating method for coins minted later in the Carthaginian gold and electrum stater series(19) (Groups VI and Xa), and also works for some Carthaginian bronzes.

Jenkins and Lewis were able to organize the electrum staters of Carthage of Groups VI and Xa into relative chronological sequences within each group based on the number of pellets (deployed above the exergual line around or sometimes on the body of the horse) occuring on the reverse of the coins. Using a similar approach, I propose here (20) a relative chronology for the map coins. In general, the more pellets on the back of one of the gold staters, the further along in the sequence the coin is. The table organizes these coins by numbers of pellets.

In general, the exergue patterns with a more map-like aspect are associated with more pellets on the reverse of the coin. Note that even in most of the unclear patterns, a central dot I interpret as Sardinia is still present.

Coin J-L 4/TCWH I 1 has a double exergue line and a "soft serve ice cream" curl at the top of Tanit's forehead that seems to link this coin stylistically to the gold staters of Group IIIb (coins J-L 14-17), coins which have both a double exergue line and (in specimens J-L 15-17) the distinctive forelock curl. Coin J-L 4/TCWH I 1 also has five pellets on the reverse (the most of any coin of J-L Group IIIa), and thus might well be expected to have the most stylistic similarities to the next group, Group IIIb. Note, however, that coin J-L 6/TCWH I 3 also has a double exergue line but has only two reverse pellets, and would thus seem to be out of sequence. Jenkins and Lewis (p. 77) did not note in their dot placement diagram for this coin that the exergual line is double.

A further piece of evidence supporting this relative chronology is provided by the two pellet coin J-L 11/TCWH 12 and the three pellet coin J-L 13/TCWH 14. Both coins share the same obverse die, but the obverse design of coin J-L 13/TCWH 14 was struck from very worn dies. Here, then, there is clear evidence that a two pellet coin preceded a three pellet coin, in accordance with the scheme proposed above.

As noted earlier, the only coin that seems to be out of sequence is J-L 6/TCWH I 3 on account of its double exergual line, which might lead one to suggest that it should be placed, as is coin J-L 4/TCWH I 1, close to the staters of Group IIIb. However, coin J-L 6/TCWH I 3 lacks the soft-serve ice cream curl shared by coin J-L 4/TCWH I and most of the Group IIIb coins. There is no reason why a double exergual line could not have appeared in the middle as well as the end of the Group IIIa series, thus coin J-L 6/TCWH I 3 does not invalidate the coin sequence proposed here for the gold staters of Group IIIa.

Assuming that this coin chronology is correct, an interesting pattern emerges in Table 1. Rows denoting coins with one or two pellets have a total of 25% world maps, whereas rows denoting coins with three to five pellets have a total of 66% maps. Admittedly the sample size is small, but there does seem to be a trend toward improvement in the quality of the map pattern later in the Group IIIa series. Did a purely decorative pattern early in the series subsequently evolve into a map? Or was the pattern always meant to be a map (most of the unclear exergue patterns have the central dot I have interpreted as Sardinia), but over time the stylization improved? Or should the map hypothesis be abandoned altogether in favor of a highly abstract but exclusively textual inscription that reads "Carthage"? The answers to these and other questions regarding these coins and their curious patterns must await the coming to light of more coins (and better preserved coins) in the Group IIIa series.

The decoding of the gold stater inscription has important implications for study of these coins. First, reading the inscription as "Carthage" probably vindicates Jenkins and Lewis' contention(21) that the coins were minted at Carthage rather than at Sicily(22) or

Sardinia(23) (unless the name "Carthage" was also used on coins struck at other mints or other "New Cities," which remains a possibility).

Second, what becomes of the map hypothesis? The degree of stylization of the inscription in the gold coins is extreme for Phoenician coins of any era. Rather than being a celator's error or a die blunder, however, this stylization was completely controlled and quite intentional as indicated by the series of progressive stylization shown in Figure 1 (1-6).

As shown by the conversion of a Punic t into an eye in coin J-L 8-3, the letters in these inscriptions could be modified to portray other images. This could even be viewed as a Africanization of Punic writing, similar to the distortion of animal images in African petroglyphs to portray rain creatures with strange proportions(24). Thus, it is still possible that the exergue pattern in the gold coins represents a Punic world map, in which case Punic letters have been distorted to create the map pattern.

A map hypothesis is also possible for the (less stylized) inscriptions on the silver coins. In discussing these coins, Mildenberg(25) noted the somewhat unusual nature of these inscriptions; in his words they resembled "a thin pearl necklace" (translation mine: "Außen feiner Perlkreis"). In discussing the map hypothesis for the exergue pattern in the gold coins (and unaware at the time of Mildenberg's writings concerning the silver coin inscription), I wrote(26):

> [The celator] was evidently taking advantage of the circular outline of the coin die and using it as a graphical convention to project a great circle of the globe. The horse stands on the chord linking South America to Southeast Asia. The ports of call are strung out on an arc of this great circle like beads on a necklace.

The letters in the "tablet" inscription (as it is referred to in SG) on the silver coins may represent ports of call from east to west. Decipherment of the gold stater inscription may, rather than falsifying the map interpretation, ultimately support the exergue map hypothesis.

This may be especially so since the only other known Phoenician map bears an interesting relationship to the exergue patterns. A Phoenician bronze bowl from the 8th century BC (Figure 2) is a cartographical representation of the world(27). On this bowl, four arrays of stylized mountains radiate away from an elongate, central body of water with islands. The largest island functions as a central dot, serving as a "centering point" for the bowl map in the same way that the central dot forms a centering point for the exergue pattern(28). The bowl map may be a prototype for the coin-maps(29).

The case is far from settled, however; the map hypothesis remains conjectural and in fact we have no idea why the Carthaginians stylized these exergue images to such an extreme degree. Space limitations are not a factor-judging from the tiny, finely detailed goat's head in the exergue of coin J-L 22, the celators could easily have rendered the inscription as clear letters on the gold coins. They had some other purpose in mind. It has been argued that the strongest evidence in

favor of the map hypothesis for the exergue pattern in the Carthaginian coins is the fact that Greeks also used maps on coins. The hinterland of Ephesus(30) appears on the reverse of coins minted during the 4th century BC (similar to the age of the Carthaginian coins discussed here).

The Farley Coins

A related series of coins, most bearing a Punic inscription, have been described from diverse places in North America (Figure 3) by Gloria Farley(31) and others(32). These very curious coins (Figure 4) would, if taken at face value, so to speak, provide direct evidence for Phoenician involvement in North American affairs in antiquity. One interpretation of the Phoenician inscription on these coins is as a statement entitling the bearer to a land allotment in the New World(33).

If true, this would be an astonishing revelation, but questions remain regarding the authenticity of these coins. Two new arguments have surfaced regarding these coins: one involves die axis, the other involves the process of electrotyping.

Die axes of the Farley coins is variable, and fortunately may be measured in specimens known only from photographs as long as they have holes in them so that the two sides may be matched. I accomplished this by tracing the outline of each side of each Farley coin from its photograph, drawing an up arrow on the tracing, and then drawing in a small circle on the tracing showing the position of the hole. Next, I glued the obverse tracing to the back side of the reverse tracing, being careful to match up the holes. From there it was simple to measure the die axis from the paper coin proxy. I currently have the Arkansas, Pennsylvania and Tennessee coins, and was able to measure die axis directly from them.

Following are the die axis measurements of the Farley coins, reported in degrees clockwise from the vertical. The Tennessee and Pennsylvania coins have vertical axes (no displacement). The Kansas, Nebraska, Georgia and Alabama coins have roughly 12 degree displacement (Alabama is only an estimate, it has no hole). The latter three coins are struck from the same obverse and reverse dies. The Connecticut coin, also struck from these dies, could not be measured as it has no hole and I lack good photographs, but it may also have something like 12 degree displacement.

The Arkansas coin has the most displacement of the series at 33 degrees. Although it seems to be a unique specimen from this set of dies, it is interesting that it has significant die axis displacement. Either it was struck from loose dies using the Sicilian process (perhaps not too surprising, since other coins in the series have obverse inscriptions mentioning Syracuse) or from fixed dies improperly placed. I see the former possibility as more likely, and thus I interpret the die displacement of the Arkansas coin as evidence supporting the authenticity of the coin.

I included(34) the Tennessee coin as one of the Farley coins primarily because of where it was found and because it has a retrograde "n" (in an inscription on the obverse) in common with the Pennsylvania coin. The Tennessee coin,

however, may be an electrotype made from a Syracusan dekadrachm. In electrotyping, a silver shell of the obverse and reverse is made using an electroplating process applied to a wax impression of the coin, the two shells are joined together, and are then filled with molten base metal to form a reproduction. Electrotypes of this sort were made in the 19th century AD by the British Museum and other museums(35). Although silver plated copies were made in antiquity (R. Doty, personal communication, 1999), whether or not the ancients were able to do electrotyping is another matter. This consideration calls into question the antiquity of the Tennessee coin. The Tennessee coin may have no connection to the other Farley coins, and any resemblances to the struck Farley coins may be coincidental (indeed, only the struck Farley coins have the Punic inscriptions on the reverse). These could be The work of counterfeiters (36) experimenting in a variety of metallic media, and then mischievously distributing their creations across the country. It is hard to imagine why someone would go to all the trouble of doing this, however, so at this point I am still leaning toward an interpretation of authenticity for the Farley coins. The question of the antiquity/authenticity of the Farley coins is at present still an unsolved problem. They are either genuinely ancient or an astonishingly skillful hoax.

To conclude, we may hope that a key piece of evidence will soon be surfacing from the bottom of the Mediterranean. Meanwhile, please contact me if you have further information concerning Carthaginian gold staters of J-L Group IIIa or additional information concerning the Farley coins, especially unpublished examples.

Figure Captions

Figure 1. Evolution of the Punic word Carthage on Gold and Silver Coins from 410-320 BC.
1, Punic inscription qrthdsht as it appears on the obverse of Carthaginian silver tetradrachms of type SG 6426. The Punic letters are clearly legible.

2, Punic inscription qrthdsht as it appears on a Carthaginian silver tetradrachm of type SG 6427. The letters have been somewhat stylized and the spacing is irregular. British Museum Carthage PCG III C. 40, PS 197869.

3, Punic inscription qrthdsht as it appears on a second Carthaginian silver tetradrachm of type SG 6427. The letters have a stylization similar to the coin previous. British Museum Carthage PCG III C. 40 AR, R4835/32, PS 061565.

4, Punic inscription qrthdsht as it appears on a Carthaginian gold stater of Group IIIa, coin Jenkins-Lewis 6. Although the inscription is heavily stylized, the Punic letters (especially the h) are still recognizable. This coin has two pellets on the reverse and is thus early in the Group IIIa series.

5, Punic inscription qrthdsht as it appears on a Carthaginian gold stater of Group IIIa, coin Jenkins-Lewis 8-3. Note the modification of the Punic letter t into an eye. This coin has four pellets on the reverse.

6, Punic inscription qrthdsht as it appears on a Carthaginian gold stater of Group IIIa, coin Jenkins-Lewis 4. This inscription is so heavily stylized that the Punic letters are no longer recognizable, although the central dot of the t and the sh (turned on its side) are visible. The symbols may also serve to portray world geography (e.g. final t = America; central dot of central t = Sardinia; symbols to left of central dot [which are still part of the central t?] = boot of Italy [above], and triangular Sicily [below]). Interestingly, depiction of Sicily as a triangle is attested to in ancient literature (Strabo; see p. 9 in P. Whitfield, 1998, New Found Lands: Maps in the History of Exploration, New York, Routledge). This coin has five pellets on the reverse and is thus late in the Group IIIa series.

7, Exergue pattern as it appears on a Carthaginian gold stater of Group IIIa, coin Jenkins-Lewis 11. No letters are recognizable, and the exergue pattern has apparently been transformed into a map of the ancient world. This coin has two pellets on its reverse.

Figure 2. Phoenician bronze bowl (8th century BC; discovered in Nimrud) showing five stylized mountain ranges radiating away from a Mediterranean like body of water with islands. Goats are visible on the mountain flanks. Bowl is 24.5 centimeters in diameter; London, British Museum.

Figure 3. Map showing distribution of the Farley coins. Coins attributed to this series have been found in Alabama, Arkansas, Kansas, Pennslyvania, Connecticut, Nebraska, Tennessee and Georgia. The coins were found between the 1840's and the 1970's.

Figure 4. Sketch of the reverse of the Farley coin reputedly found in Waterbury, Connecticut in 1958. Images on this side of the coin include protome of the Carthaginian horse, a palm tree with dangling roots, an incomplete border of dots and the Punic inscription bpgrlt. Diameter of coin approximately 29 mm.

MOSES/MUSAEUS/MOCHOS AND HIS GOD YAHWEH, IAO, AND SABAOTH, SEEN FROM A GRAECO-ROMAN PERSPECTIVE

George H. van Kooten

Introduction

The revelation of Yahweh's name to Moses on Mount Horeb is a decisive episode in the narrative of Moses according to the book of Exodus (3:1). Mount Horeb also features later in Jewish Scripture. It is the place where Moses transmits Yahweh's Ten Commandments to Israel (Deuteronomy 1:6; 4:10; 4:15; 9:8; also 1 Kings [= 3 Kings LXX] 8:9). Furthermore, it is the destination of Elijah's journey: an angel takes him out of his depressed state of mind under a broom bush and sets him on his feet for a journey to Mount Horeb, where Yahweh reveals himself to him, too (1 Kings [= 3 Kings LXX] 19:8). Yahweh's revelation on Mount Horeb is a powerful theme in the Jewish Scripture, and in this paper I shall address the question of whether something of the revelation of Yahweh's name to Moses, the second founding father of Judaism after Abraham, was known to the Greeks, and how *they* perceived Moses and Yahweh. As Martin Goodman has indicated, Graeco-Roman authors, aware of Jerusalem and the Temple as dominant features of Jewish religion,

> wrote much about the role there of the priestly caste and the high priests as leaders of the people. There would be much less certainty about the divinity worshipped. Pagan writers mostly agreed that Jewish cult was aniconic, but they differed widely in their views on the deity understood by Jews as the recipient of their offerings. Was it Jupiter, as Varro thought, or Dionysus, as Plutarch suggested? Other suggestions included Iao, the sky, or the god 'of uncertain name'.[1]

In this paper, I shall comment on the variety of these attempts at identifying the God of the Jews. First, I shall sketch a general picture of Greek views on Moses, paying special attention to the contexts

in which the issue of the Jewish God's name arises. The specific relevant passages can only be appreciated, however, when viewed against the more general background of Graeco-Roman evaluations of Moses (§1). Secondly, this tracking of the 'Greek Moses' gives rise to a further consideration about whether in fact, in a particular Greek source, Moses might also have been identified with the figure of Mochos, who is frequently mentioned in Greek sources (§2). Thirdly, I shall give an analysis of Greek references to Iao, as Yahweh is referred to by Greek authors (§3). Finally, this analysis will be concluded with a discussion of Sabaoth, a name which also occurs in Greek authors and derives from the Hebrew Yahweh Sabaoth, as Yahweh is often called in full (§4).

Although nobody would decline the help of Menahem Stern's monumental, three-volume collection of Greek and Roman sources about the Jews, entitled *Greek and Latin Authors on Jews and Judaism* (Jerusalem, 1974–84), I have first undertaken independent research into the Greek sources and supplemented this research with my use of Stern's collection. This procedure results in a different emphasis on one Greek source, Alexander Polyhistor, and has also yielded a text by the first-century AD physician Dioscorides not included in Stern. Nevertheless, I will make continuous reference to the numbers of Stern's texts.

1. The Figure of Moses in Graeco-Roman Authors

First, we turn to the figure of Moses in Graeco-Roman authors. I shall deal with the occurrences in chronological order. As we shall see, there is no reason to conclude with the lexicon article on Moses by Beate Ego in *Der neue Pauly*, that 'die Figur des Moses in der paganen Literatur vor allem im Kontext antisemitischer Aussagen (steht)'.[2] Ego's conclusion is at odds with Gager's much more balanced study by the name *Moses in Greco-Roman Paganism* (1972), in which he shows that 'anti-Semitism was not a constant companion of the Jews in antiquity' and that there is little foundation for the view that the intelligentsia were the 'true anti-Semites' of the ancient world.[3] The views among the intelligentsia were much more varied.

At the end of his study, Gager concludes: 'The first and most enduring reaction of the Greek world to Moses was positive. (. . .) In the end, (. . .) the more positive view of Moses prevailed.'[4] Although there does appear to have been a specific anti-Jewish polemic in Egypt in the Hellenistic-Roman era, the entire reception of Moses in antiquity seems to have been much less black-and-white than Ego suggests, and to have included a considerable positive perception.

The oldest reference to Moses in Greek literature seems to have been made by the sixth-century BC ethnographer and chronicler Hellanicus of Lesbos. Hellanicus is ranked with Herodotus and Thucydides as one of the authors who have done most to influence the development of Greek historiography. The next to refer to Moses was Philochorus (*c.* 340–260 BC), a scholar-historian who took a scholarly interest in local Greek history, chronography, cult, and literature. Both names we have on the authority of Pseudo-Justin Martyr (3rd–5th cent. AD), who says in his *Exhortation to the Greeks*, that 'those who write the Athenian history, Hellanicus and Philochorus, the author of *The Attic History*, (. . .) have mentioned Moses as a very ancient and time-honoured prince of the Jews' (*FGrH* 4 frg. 47b; 328 frg. 92b; Stern, No. 565).[5]

Lysimachus of Alexandria (355–281 BC), a contemporary of Philochorus, is perhaps an instance of animosity towards Moses and the Jews, as Josephus tells of him that he brings up the same theme as later writers such as Manetho, Apion, and Chaeremon, to the effect that the Jews in Egypt became afflicted with leprosy. According to Lysimachus, they took refuge in the temples and lived a mendicant existence, and spread the disease throughout Egypt. When the Egyptians were about to purge the temples of these impure and impious Jews, drive them out into the wilderness, and drown the lepers, Moses advised them to take their courage into their own hands, leave Egypt, and make their way straight through the wilderness until they reached inhabited country and settled in Judaea (*Against Apion* 1.304–311; cf. 2.145; Stern, No. 158). As we shall see, Lysimachus' anti-Semitic stance is also taken by other Egyptian authors like Manetho, Apion, and Chaeremon.

[4] Gager 1972, 163–4.

[5] Stern doubts if Pseudo-Justin's statement concerning the references to Moses by Hellanicus and Philochorus is indeed true; see Stern 1984, vol. 3, 38–40.

This anti-Jewish account contrasts sharply with the more positive account of Lysimachus' contemporary Hecataeus of Abdera (4th–3rd cent. BC), who likewise tells the story of the outbreak of pestilence in Egypt, but goes on to include not only the Jews, but also the Greeks as victims of the Egyptian measures against foreigners. The most outstanding and active foreigners banded together and arrived in Greece, among other destinations, whereas the greater number of foreigners were driven into Judaea. In this interpretation, both Jews and particular notable Greeks originated from Egypt, when they were expelled by the Egyptians. Within this framework, Hecataeus draws a more sympathetic picture of Moses. As Momigliano has suggested, his interest seems to be part of the Hellenistic discovery of Judaism after the Greeks' conquest of the Persian Empire. Although Greek curiosity extended to other barbarians as well, the

> Jews were the newcomers. Everything had still to be learnt about them. It is perhaps not by chance that the first Greek book to speak extensively about the Jews was written by an adviser of Ptolemy I [Hecataeus, that is] in the years in which he was campaigning for the conquest of Palestine.[6]

In Hecataeus, Moses is called outstanding both for his wisdom and courage, and, as the founder of the temple of Jerusalem and the one who instituted its forms of worship and ritual, is credited with a very philosophical theology: 'he had no images whatsoever of the gods made for them, being of the opinion that God is not in human form; rather the heavens which surround the earth are alone divine, and rule the universe'.[7] Hecataeus also highlights Moses' function as a lawgiver, and explicitly remarks that 'at the end of their laws there is even appended the statement: "These are the words that Moses heard from God and declares unto the Jews"' (cf. Deuteronomy 29:1;

[6] Momigliano 1971, 83–84.

[7] Hecataeus' positive remarks encouraged the writing of a pseudepigraphic work under his name *On the Jews*. According to Origen, 'a book about the Jews is attributed to Hecataeus the historian, in which the wisdom of the nation is emphasized even more strongly [in comparison with Numenius and Pythagoras, that is]—so much so that Herennius Philo in his treatise about the Jews even doubts in the first place whether it is a genuine work of the historian, and says in the second place that if it is authentic, he had probably been carried away by the Jews' powers of persuasion and accepted their doctrine' (*Against Celsus* 1.15). See the commentary by Chadwick 1953, 17 note 4 on this Jewish forgery. On Pseudo-Hecataeus, see, extensively, Bar-Kochva 1996.

Hecataeus in Diodorus Siculus 40.3.1–6; Stern, No. 11).[8] As will become clear, this line of positive appreciation also runs through history and comes to the fore, for instance, in Strabo, who seems to elaborate on Hecataeus' positive representation of the Jewish concept of God.

An anti-Jewish image of Moses arises again in Manetho, who was an Egyptian high priest in Heliopolis in the early Ptolemaic period, around 280 BC, and wrote a history of Egypt. Interestingly, Manetho, a Heliopolitan priest himself, regards Moses as a former priest of the god Osiris at Heliopolis, who changed his allegiance, and in the place of his theophoric name Osarseph, which referred to Osiris, took on a new name, Moses (Verbrugghe & Wickersham 1996, frg. 12: Josephus, *Against Apion* 1.250; cf. frg. 13; Stern, No. 21).

A very interesting case of Greek acquaintance with Moses is presented by Alexander Polyhistor. His familiarity with Moses also includes knowledge of the revelation of God's name to Moses. Born at Miletus in about 105 BC, Alexander was brought to Rome as a slave in the aftermath of the Mithradatic Wars. Having received Roman citizenship at Rome after he had been freed, Alexander became a teacher and produced, among other works, geographical compilations, including works on Rome, Delphi, Egypt, the Chaldaeans, and the Jews. His interest in the Jews may well have been prompted by Pompey's capture of Jerusalem and the subsequent incorporation of Judaea into the Roman Empire in 63 BC.[9]

Within this material, Alexander also drew comparisons between various historical sources and sought their congruence. This can be demonstrated from a remark on Moses. Commenting on a certain 'Cleodemus the prophet', who in his history of the Jews lists Abraham's descendants by his second wife Katura, Alexander explicitly remarks that this information is in conformity with the narrative of the Jews' lawgiver Moses (Josephus, *Jew. Ant.* 1.240).[10] The congruence between Moses and other historical writers is of interest to this Roman ethnographer. This comparative historical research is also in evidence in

[8] Hecataeus also regards Moses as having introduced 'an unsocial and intolerant mode of life', but explains this 'as a result of their [the Jews'] own expulsion from Egypt'.

the first-century BC historian Nicolaus of Damascus, who, in his universal history, draws similar lines between extrabiblical accounts and Moses.[11]

Among his Jewish sources, Alexander Polyhistor also consulted the Jewish writer Artapanus, who lived in the third or second century BC. Although hardly a fragment of Artapanus has survived apart from the summaries which Alexander gives of Artapanus' works in his compilations,[12] and which, in turn, are now only extant in Eusebius of Caesarea, most scholarly attention seems to have been drawn to the Jewish author Artapanus himself, rather than his later Greek compilator Alexander Polyhistor, as if the latter were only the uninteresting vessel in which the literary remains of Artapanus were stored. Stern's collection of Graeco-Roman authors on Jews and Judaism is no exception. Stern gives the outline of Eusebius' *Preparation for the Gospel* IX.17–39 (Stern, No. 51a), in which Polyhistor's fragments from Artapanus are transmitted, yet does not give the full texts of the fragments themselves. It is highly remarkable, however, that Alexander made such extensive use of Artapanus' views on Moses, as we shall see presently, and included them in his encyclopaedic material.

These views on Moses included the idea that Moses, when grown up, was called Musaeus by the Greeks (Eusebius, *Preparation for the Gospel* IX.27.3).[13] Among the Greeks, Musaeus was known as a mythical singer with a descriptive name which pointed at his affiliation to the Muses. The second-century AD Greek philosopher Numenius, too, identified Moses with Musaeus (frg. 9; see below at the end of §1 and also Burnyeat, this vol., §1). Alexander Polyhistor, however, also took over Artapanus' view that Moses became *the teacher* of Orpheus (Eusebius IX.27.4). Whereas in Greek sources Musaeus is in fact viewed as *the disciple* of Orpheus, according to Artapanus' identification of Musaeus with Moses, followed by Alexander Polyhistor, this relationship is inverted and Orpheus is represented as *the disciple*

of Moses, alias Musaeus. This representation could be due to a corruption of Alexander Polyhistor's text in Eusebius, who preserved Alexander's summaries of Artapanus, but it seems likely that Alexander found Artapanus' identification of Moses with Musaeus and his reversal of the relationship between Musaeus and Orpheus unproblematic. As Holladay has pointed out, this is in fact only a modification of the Greek view in Hecataeus of Abdera (*FGrH* 264, frg. 25 = Diodorus Siculus 1.96.2) that 'Orpheus transmits to the Greeks the sacred wisdom gained in his Egyptian travels (. . .). It is altered by Artapanus so that Moses, not the Egyptian priests, becomes the ultimate source of Greek wisdom.'[14] In this way Moses was interwoven into Greek history in an encyclopaedic work of a respected scholar in first-century BC Rome. Moses is even described as the first inventor of philosophy (IX.27.4). This philosophical characterization of Moses runs parallel to his depiction, as discussed above, by Hecataeus of Abdera.

Of direct relevance to the topic of this conference volume is the fact that Alexander also includes Artapanus' material on the revelation of God's name to Moses. On this account, once, as Moses was praying to God on behalf of the Jews, 'suddenly (. . .), fire appeared out of the earth, and it blazed even though there was neither wood nor any other kindling in the vicinity. Frightened at what happened, Moses fled but a divine voice spoke to him' (IX.27.21). After he met with the Egyptian king, Moses told him that he had come 'because the Lord of the universe had commanded him to liberate the Jews' (IX.27.22). The divine voice which revealed itself to Moses appears to be understood as 'the Lord of the universe'. Not amused by this statement, the king imprisoned Moses, but during the night Moses was miraculously freed from prison and gained access to the king, who, interrupted in his sleep, 'ordered the name of the god who had sent him.' As soon as Moses revealed this name to him, the king fell down speechless. Having been resuscitated by Moses, the king 'wrote the name on a tablet and sealed it securely, but one of the priests who showed contempt for what was written on the tablet died in a convulsion' (IX.27.23–26).

This extensive use of material from Artapanus by Alexander Polyhistor is proof of pagan acquaintance with the narrative of the

revelation of God's name to Moses in first-century BC Rome. Much emphasis is now laid on the magical influence of this name.[15] Apart from Artapanus' report of this revelation, Alexander Polyhistor also knew the similar, though much briefer account in another Jewish author, Ezekiel the Tragedian, who is dealt with by Jacques van Ruiten is his contribution to this volume. Ezekiel, in his tragic drama *The Exodus*, also mentions the episode of the burning bush (frg. 8; Eusebius, *Preparation for the Gospel* 9.29.7) and talks about 'the divine word' (θεῖος λόγος) which beams forth from this bush (frg. 9; Eusebius, *Preparation for the Gospel* 9.29.8).[16] Yet, Ezekiel does not mention the revelation of the name, but, in accordance with the play's central topic, only God's order to Moses to tell the Egyptian king that he should allow Moses to lead the Jews forth from Egypt (frg. 9). Since both accounts of the burning bush became part of Alexander's ethnographic, encyclopaedic compilations, it is no exaggeration to assume that this story must have become widespread, dependable information in particular circles at Rome. This is particularly probable if one bears in mind that Alexander taught people in Rome such as Hyginus, who was in turn the teacher of Ovid and was appointed by Augustus librarian of the Palatine Library, which might, therefore, well have included copies of Alexander Polyhistor's works.

Nevertheless, in Rome scholarly visitors and residents will have held varying and conflicting views of Moses. We know from Josephus that in the first century BC, Apollonius Molon of Alabanda, in the province of Asia, was among those whom Josephus deemed to have espoused ignorant and ill-willed reflections on Moses and his law code (*Against Apion* 2.145). Apollonius lectured at Rhodes and visited Rome in the 80s BC, and taught Romans such as Cicero (Stern, No. 49).

It was also in Rome that the Greek historian Diodorus Siculus settled down and, after decades of work, completed his grand universal history around 30 BC. The *Library of History*, as this universal history is called, runs from mythological times to 60 BC. The first six books are devoted to the period prior to the Trojan War and include a description of Egypt with mention of Moses in book 1, the contents of which Diodorus drew from Hecataeus of Abdera.

[15] Cf. Gager 1972, 142.

[16] Both fragments have also been preserved via Alexander Polyhistor. See Holladay 1989, 451 note 91 and 453 note 100.

Dealing with the first lawgivers in Egypt, Diodorus reports that, 'After the establishment of settled life in Egypt in early times (. . .), the first, they say, to persuade the multitudes to use written laws was Mneves (Menas).'[17] To convince the people, Mneves claimed that the laws had been given to him by the god Hermes, 'with the assurance that they would be the cause of great blessing,' and this device—Diodorus adds—was also used by the Greeks, who claimed to have received their laws from Zeus or Apollo, and by several other peoples, such as the Jews, among whom 'Moses referred his laws to the god who is invoked as Iao'. Whereas Alexander Polyhistor shows that the story of the revelation of God's name to Moses is known outside Jewish circles, Diodorus is the first testimony of Greek acquaintance with the actual name itself. Diodorus mentions this name in a context in which he discusses the alleged divine origins of human law. Egyptians, Greeks, Jews, and others ascribed their laws to the gods, 'either because they believed that a conception which would help humanity was marvellous and wholly divine, or because they held that the common crowd would be more likely to obey the laws if their gaze were directed towards the majesty and power of those to whom their laws were ascribed' (Diodorus 1.94.1–2; Stern, No. 58).[18]

This passage from Diodorus is particularly relevant here, as it demonstrates that Greeks such as Diodorus were aware of the name of Moses' God, called 'Iao' in Greek. This is remarkable, as after the return from the Babylonian Exile in 539 BC, the Jews increasingly refrained from invoking and pronouncing the name of Yahweh.[19] The Aramaic papyri from the Jews at Elephantine show that 'Iao' is an original Jewish term.[20] It is also found in a Septuagint version

[17] Pseudo-Justin Martyr (3rd–5th cent. AD), *Exhortation to the Greeks*, edn. Morel, p. 10Bff., where he draws extensively on the passage from Diodorus Siculus, mistakes the reference to Mneves for Moses, turning the latter into the first lawgiver of the Egyptians.

[18] This criticism of the divine origins of human law is also applied to Moses' law by Apion; see Josephus, *Against Apion* 2.25 (Stern, No. 165): 'Moses went up into the mountain called Sinai, which lies between Egypt and Arabia, remained in concealment there for forty days, and then descended and gave the Jews their laws'.

[19] See, e.g., Bickerman 1988, 262–6 at 262: 'Another marked change in the attitude of the new age to the ancient revelation was the progressive disuse of the proper name of the Deity, YHWH (disclosed to Moses in the burning bush), and the adoption of various circumlocutions to denote the God of Jerusalem. The change is postexilic'; and Rösel 2000.

of a fragment of Leviticus among the Dead Sea Scrolls, *4Q120*, dating probably from the first century AD.[21] Given the increasing use of 'Iao' in Graeco-Roman authors and in the Greek magical papyri, as we shall see below, Peter Schäfer's observation that Iao as the name of the Jewish God 'has gone out of fashion gradually on "official" documents [of the Jews] and has been favourably adopted by pagan writers and by literary genres (magical papyri, amulets, etc.) which tend to be syncretistic' seems to be most apt.[22] From the surviving evidence, this development first comes to light in Diodorus' designation of Moses' God as Iao.

Moses is also referred to in other passages in Diodorus' universal history. We have already discussed the passage from Hecataeus, preserved in Diodorus, in which Moses was hailed for his wisdom and admired for his philosophical conceptions of God and aniconic form of worship (Diodorus 40.3). In passing, Diodorus also mentions Moses in his description of the desecration of the temple in Jerusalem by the Greek-Seleucid king Antiochus IV Epiphanes, who, ironically in view of Moses' supposed institution of aniconic worship, finds there 'a marble statue of a heavily bearded man seated on an ass, with a book in his hands,' which Antiochus supposes 'to be an image of Moses, the founder of Jerusalem and organizer of the nation, the man, moreover, who had ordained for the Jews their misanthropic and lawless customs' (1.94; Stern, No. 63).

The fact that despite such anti-Jewish overtones, one would be mistaken to lay too much emphasis on the anti-Semitic setting of pagan references to Moses, thereby obscuring some telling passages to the contrary, becomes clear again from Strabo, who studied in first-century BC Rome, and made several visits to Rome on later occasions. In his *Geography*, Strabo also discusses Judaea, whose inhabitants he regards as descendants of the Egyptians (16.2.34): 'Moses, namely', Strabo continues, 'was one of the Egyptian priests (. . .), but he went away from there to Judaea, since he was displeased with the state of affairs there, and was accompanied by many people who

https://creativecommons.org/licenses/by-nc-nd/4.0/

worshipped the Divine Being (τὸ θεῖον).' Similarly to Hecataeus and Diodorus, Strabo contrasts Moses' view on God with the animal worship of the Egyptians and the anthropomorphic representation of the gods among the Greeks: 'for, according to him, God is this one thing alone that encompasses us all (τὸ περιέχον ἡμᾶς ἅπαντας) and encompasses land and sea—the thing which we call heaven, or universe, or the nature of all that exists: ὃ καλοῦμεν οὐρανὸν καὶ κόσμον καὶ τὴν τῶν ὄντων φύσιν (16.2.35; Stern, No. 115).[23] It is perhaps not too far-fetched to suggest that Strabo's interpretation of the Jewish God as 'the nature of all that exists,' ἡ τῶν ὄντων φύσις, is an allusion to the revelation of God's name to Moses as Ἐγώ εἰμι ὁ ὤν (Exodus 3:14). This ontological meaning of the name of Yahweh in Greek sources is the topic of Myles Burnyeat's contribution to this volume.

By offering this ontological interpretation of the Jewish God, Strabo moves beyond Hecataeus. Already Hecataeus, as we have seen, equated the God of the Jews with the heavens. Talking about Moses, Hecataeus says that 'he had no images whatsoever of the gods made for them, being of the opinion that God is not in human form; rather the heavens that surround the earth are alone divine, and rule the universe' (Diodorus 40.3.4; Stern, No. 11; cf. Burnyeat, this vol., beginning of §4: 'material things must be held together and governed by some changeless incorporeal entity'). As Stern informs us, Hecataeus explains the aniconic Jewish worship of God in the same way as Herodotus commented on the Persians: 'The first nation known by the Greeks to have spurned idolatry were the Persians; see Herodotus, I, 131. Herodotus, who had some difficulty in defining an abstract deity, thought that the Persians worshipped the sky'[24] (see also Van den Berg, this vol., §2).

---

[23] A similar stress on the one-ness of God, combined with respect for the Jewish criticism of idols, is found in Varro, Strabo's older contemporary in Rome. See Varro apud Augustine, *The City of God* 4.31: 'He [Varro] also says that, for more than 170 years, the Romans of old worshipped the gods without an image. "If this practice had remained down to the present day", he says, "the gods would have been worshipped with greater purity". In support of this opinion, he cites, among other things, the testimony of the Jewish nation (. . .). Hence, when he says that only those who believe God to be the governing soul of the world have perceived what He is; and when he deems that the rites of religion would have been observed more purely without images: who can fail to see how close he has come to the truth?' (transl. R.W. Dyson; Varro, frg. 18 edn. Cardauns).

Hecataeus' characterization of Jewish religion as worshipping the heavens is not only taken over by Strabo, but surfaces again in later authors such as Juvenal, at the beginning of the second century AD, and Celsus. In his fourteenth Satire, Juvenal depicts an instance of pagan reverence for the Sabbath. This devotion, in Juvenal's view, amounts to worshipping the heavens: 'Some who happen to have been dealt a father who reveres the Sabbath, worship nothing but the clouds, and the divinity of the heavens' (Juvenal 14.96–97; Stern, No. 301). Likewise, though only implicitly in his attack on the Christians, Celsus says: 'It is because certain Christians have misunderstood sayings of Plato that they boast of a God who is above the heavens and place Him higher than *the heaven in which the Jews believe*' (Celsus in Origen, *Against Celsus* 6.19; Stern, No. 375; see also *Against Celsus* 5.41 and Van den Berg, this vol., §2). Perhaps, as Bickerman suggests, this way of equating the abstract Jewish God with the heavens is also reinforced by the frequent designation of God in the Septuagint as 'the God of Heaven' (ὁ θεὸς τοῦ οὐρανοῦ).[25]

To return to Strabo, Strabo clearly shares this tradition, but it is interesting to see that he not only identifies the Jewish God with the heavens that surround the earth, as does Hecataeus, but also with the universe and, even more importantly, with 'the nature of all that exists (ἡ τῶν ὄντων φύσις)'. Strabo continues this passage by explaining the attraction of Moses' aniconic conception of God to 'not a few thoughtful men', whom Moses led away from Egypt to Jerusalem, and hailing Moses' establishment of an appropriate worship, ritual, and government. His descendants, however, are blamed for degenerating into superstitious and tyrannical people (16.2.36–37; Stern, No. 115).

Explicit anti-Jewish remarks come to the fore in first-century AD authors such as Apion and Chaeremon. Both are Egyptian, and their anti-Jewish attitude cannot be divorced from the Jewish-Greek tensions in Alexandria, which increased when Rome annexed Egypt in 30 BC. In this, they continue the line developed by Lysimachus and Manetho in the fourth/third century BC. Apion, who was head of

[25] Bickerman 1988, 263: 'translated into Greek (or Latin), this designation of the Lord was somewhat equivocal; "the God of Heaven" could seem to refer to the sky and therefore, to the cosmic deity of the philosophers. In fact, Greek savants perpetuated this interpretation of the God of Jerusalem; it still appears under the pen of Juvenal and even in Celsus' critiques of the Christian faith.'

the Alexandrian School, like Manetho regarded Moses as a native of Heliopolis, and, like Lysimachus and Manetho, considered the exodus from Egypt as a consequence of an outbreak of leprosy among the Jews (Josephus, *Against Apion* 2.8–9; Stern, No. 164).[26] Apion, whose anti-Jewish views were addressed by Josephus in the work now known as *Against Apion*,[27] was also part of the delegation sent by the Greeks of Alexandria to Gaius Caligula in order to resolve the Greek-Jewish tensions.[28] The designation of Moses as the leader of a group of lepers also occurs in Chaeremon of Alexandria, who taught the young Nero, wrote on Egyptian history and religion, and himself had Stoic inclinations (Josephus, *Against Apion* 1.288–290; Stern, No. 178).[29] It can hardly be a coincidence that the most anti-Jewish reports on Moses, those by Lysimachus, Manetho, Apion, and Chaeremon, and the depiction of Moses as having 'much dull-white leprosy on his body' by later authors such as Nicarchus (Stern, No. 248), Ptolemy Chennus (Stern, No. 331), and Helladius (Stern, No. 472) all emanate from Egypt. This is not to say that this view on the exodus of Jewish lepers from Egypt remained restricted to Egyptian circles. It is also voiced by authors such as Diodorus Siculus (*Library of History* 34–35, 1.1–2; Stern, No. 63), Pompeius Trogus at the turn of the Common Era (Iustinus, *Historiae Philippicae* 36.2.12; Stern, No. 137), Tacitus (*Histories* 5.3.1; Stern, No. 281) and, perhaps also by Herennius Philo of Byblos (Stern, No. 329; cf. No. 472). Nevertheless, the predominance of Egyptian writers among those expressing anti-Semitic views is significant.

A fascinating case in its own right is that of Herennius Philo of Byblos (*c.* AD 70–*c.* 160), who links the Jews and the name of their God with the history of the period before the Trojan War (*FGrH* 790, frg. 1; Stern, No. 323) in the following way.[30] Philo, who came from Byblos in Phoenicia, wrote a history of this area in Greek, and

[26] Josephus, *Against Apion* 2.9–14.

[27] On the figure of Apion in Josephus' *Against Apion*, see Jones 2005.

[28] Apart from the references to Apion in Josephus' *Against Apion* 2.9–14 (Moses as a Heliopolitan), 2.15 (Moses' leadership during the exodus), 2.25 (Moses at Mount Sinai) and 2.28 (introduction of novel features into the story of Moses), Apion is also mentioned in connection with Moses in Eusebius, *Preparation for the Gospel* X.10.16 as a source for the dating of Moses and the Jewish exodus from Egypt.

[29] Cf. the article by Frede 1989 on Chaeremon; fragments edited by Van der Horst 1984.

[30] This fragment has been preserved in Eusebius, *Preparation for the Gospel* 1.9.20–21 via Porphyry.

claimed that he derived his material about the Jews from Sanchuniathon of Berytus, who is credited with having written 'the truest history' of the Jews, and whose writings Philo purports to have translated into Greek.[31] Philo underlines the trustworthiness of Sanchuniathon's report on the Jews by stating that Sanchuniathon himself had received the records from Hierombalus, 'the priest of the god Ieuo', and had had his history approved of by Abibalus, king of Berytus, and by 'the investigators of truth in his time'. It seems likely to me that Hierombalus, who is otherwise unknown in Greek sources, and is presented as the priest of the god Ieuo, a name equally unique to this passage, was understood, either by Philo or by his source, as a priest of the Jewish god Iao[32]—the name we already encountered in Diodorus Siculus. For this reason Sanchuniathon's history of the Jews would have been regarded by Philo as reliable, inasmuch as Sanchuniathon was presented as having derived his information about the Jews from a Jewish priest of Iao. As we shall see in due course, Philo himself, in another fragment from his works, proves to be familiar with Iao as the name of the Jewish God. This all adds up to the reasonable assumption that Philo of Byblos associated the Jews with the divine name Ieuo or Iao, and inferred that this name was already in use before the Trojan War.

Not far from Byblos in Phoenicia, other references to Moses are found in the surviving fragments of writings by the Platonist philosopher Numenius of Apamea in Syria, a near-contemporary of Philo of Byblos. Like Alexander Polyhistor before him, Numenius identifies Moses with Musaeus (frg. 9; Stern, No. 365; see also Burnyeat, this vol., §1 note 10). Whereas his fellow-Platonist Celsus 'rejects Moses from the list of wise men', which comprises, among others, Musaeus and Orpheus (Origen, *Against Celsus* 1.16; Stern, No. 375; see also Burnyeat, §1), Numenius shows a very different assessment of Moses, and even poses the rhetorical question: 'What is Plato but Moses speaking Attic?' (frg. 8; Stern, No. 363; see also Burnyeat, §§1–2). As is clear from Myles Burnyeat's contribution to this volume,

[31] Scholars agree that Sanchuniathon's writings do not antedate the Trojan War, but are probably a product of the Hellenistic era. Cf. Goodman 1996; Attridge & Oden 1981; and Baumgarten 1981, 51, 55, 57, 58–60.

[32] The name 'Ieuo' in this passage from Philo of Byblos (which has been preserved, via Porphyry, in Eusebius' *Preparation for the Gospel*) is indeed changed into 'Iao' in Theodoretus of Cyrrhus in Syria (*c.* AD 393–466), *Graecarum affectionum curatio* 2.44.

Numenius' high esteem for Moses has to do with the latter's ontological appellation for God as 'I am that I am' (Exodus 3:14).[33] Numenius himself is also reported to have quoted Moses (frg. 1c), and to have told a story about Moses' confrontation with the Egyptian magicians Jannes and Jambres (frg. 10; cf. Exodus 7:11; cf. Burnyeat, §2). Indeed, among his fragments there is evidence of Numenius' acquaintance with the creation account of Genesis (frg. 30; Stern, No. 365).[34]

This outline of the earliest Greek evidence concerning Moses may now suffice, and, apart from some occasional remarks, I will not go into the reception of Moses in the later Greek writers Galenus, Celsus (who is dealt with by Robbert van den Berg in this volume), Porphyry, and Julianus, and in the Greek magical papyri. These later authors are left out from further systematic consideration, as it has become sufficiently clear that the reception of Moses in Greek literature up to Numenius was varied, and reactions towards him certainly not predominantly hostile. There are even traces of acquaintance with the name of the Jewish God in Alexander Polyhistor, Diodorus Siculus, Strabo, Philo of Byblos, and Numenius. I shall add some other evidence below, but shall first discuss an interesting possibility that Moses was not only identified with Musaeus (as Alexander Polyhistor and Numenius have it), but also, elsewhere, with the Phoenician prophet and natural philosopher Mochos of Sidon, who allegedly lived before the Trojan War.

2. Mochos in Greek Writings: Pythagoras, the Descendants of Mochos, and the Jews

The reason to assume that Moses was identified with Mochos of Sidon lies in the fact that the Neoplatonist philosopher Iamblichus (*c.* AD 235–*c.* 325), in his book *On the Pythagorean Way of Life*, sketches Mochos in a way which is reminiscent of Moses. As John Dillon puts it, 'this Mochos (. . .) sounds suspiciously like a garbled form of

[33] Cf. also Stern 1980, vol. 2, 209: 'It has been suggested that Numenius had in mind the way in which Plato, introducing the Artificer, used the term τὸ ὂν ἀεί which Numenius combines with the ὁ ὤν of the Septuagint', with reference to Merlan 1967, 100.

Moses himself.'[35] According to Iamblichus, the philosopher Pythagoras, sent by his teacher Thales from Miletus to the Egyptian priests for further studies, first sailed to Sidon in Phoenicia (2.11–3.13). There,

> he joined the descendants of Mochus, the prophet and natural philosopher, and other Phoenician hierophants, and was initiated into all sacred rites of the mysteries celebrated especially in Byblos and in Tyre, and in many parts of Syria. (. . .) Having learned besides that those which existed there (in Syria) were somehow derived and descended from the sacred rites in Egypt, he hoped thus to participate in the more noble, more divine and pure rites of Egypt. Filled with admiration for them, then, in accord with instructions from his teacher Thales, he was transported without delay by some Egyptian seamen who had most opportunely anchored at the shore under Carmel, the Phoenician mountain where Pythagoras spent a good deal of time alone in sacred pursuits. (. . .) And they (the seamen) remembered how, when they first anchored, he was seen coming from the top-most crest of Carmel; for they believed it the holiest of mountains, and not accessible to the common multitude (3.14; transl. J. Dillon & J. Hershbell).[36]

The setting of this passage in Iamblichus gives the figure of Mochos a particularly Jewish aura. (1) It is suggested that the descendants of Mochos do not just live in Phoenician Byblos and Tyre but, more broadly, in Syria, which includes Syria Palestina. (2) Moreover, even the term 'Phoenician' seems to have been a rather general reference which overlaps to some extent with 'Hebrew' and 'Jewish'. This is apparent from a passage in Philo of Byblos, which will be discussed later, in which Philo regards the divine name Iao, which we have already encountered in Diodorus Siculus as a designation of the *Jewish* God, as *Phoenician* (*FGrH* 790 frg. 7). This suggests that 'Phoenician' and 'Hebrew' are somehow interchangeable. (3) The rites which the descendants of Mochos celebrate in Syria are said to derive from Egypt. This might point to the Egyptian provenance of Moses and suggest that Mochos and Moses are considered identical. In that case, the mention of rites derived from Egypt and now common among Mochos' descendants in Syria might presuppose the event of the exodus of Moses and his descendants from Egypt to Syria

[35] Dillon 1996, 143.

[36] Text quoted in Stern 1980, vol. 2, 443–444, but not as a separate number. Stern refers briefly to Mochos in Stern 1974, vol. 1, 129, mentioning Iamblichus merely in passing.

Palestina.[37] (4) Although Mount Carmel, mentioned in Iamblichus as the place of Pythagoras' regular retreat, is known in Antiquity as the holy mountain of Zeus (Scylax, *Periplus Scylacis* 104; 5th/4th cent. BC) and is also noted for a cult and oracle consulted by Vespasian (Tacitus, *Histories* 2.78.3 = Stern, No. 278; Suetonius, *Vespasian* 5.6 = Stern, No. 313), it also has a strong Jewish association inasmuch as it is linked with the prophet Elijah (1 Kings [= 3 Kings LXX] 18:19–20) in Jewish tradition. Like Pythagoras in Iamblichus, Elijah is said to have climbed to the crest of Carmel (1 Kings [= 3 Kings LXX] 18:42).

All these features seem to warrant Dillon's surmise that Mochos in this passage 'does sound suspiciously like a garbled form of Moses himself'.[38] If Mochos here is indeed to be identified with Moses, Iamblichus' picture of Pythagoras studying with the descendants of Mochos/Moses seems also to be congruent with views entertained by the third-century BC Greek biographer Hermippus of Smyrna, who had closely linked Pythagoras and the Jews (Stern, Nos 25 & 26; see also Burnyeat, this vol., §1 note 6). His views have been preserved in Josephus and Origen. According to Josephus, 'Hermippus (. . .), in the first book of his work on Pythagoras, (. . .) states that the philosopher (Pythagoras) (. . .) was imitating and appropriating the doctrines of Jews and Thracians' (*Against Apion* 1.163–165; cf. 1.14, 1.162 and 2.168, and Aristobulus, frgs. 3 and 4).[39] Origen, in a similar vein, says that 'Hermippus in his first book on "Lawgivers" related that Pythagoras brought his philosophy to the Greeks from the Jews' (1.15). Both reports on Hermippus talk about Pythagoras' contact with the Jews and thereby seem to confirm the likelihood that Iamblichus, in his story of Pythagoras' visit to Syria and Mount Carmel, blended Mochos and Moses.

---

[37] The Jewish emigration from Egypt to 'Syria Palestina' is also mentioned by the Stoic geographer Polemon of Ilium (fl. *c.* 190 BC); see Eusebius, *Preparation for the Gospel* 10.10.15: 'a part of the Egyptian army was expelled from Egypt and established itself in the country called Syria-Palaestina not far from Arabia' (Stern, No. 29).

[38] Dillon 1996, 143. Cf. also, more cautiously, Dillon & Hershbell 1991, 41: 'The connection of "Mochus" with Moses is tenuous.'

[39] The Thracians seem to be mentioned in one breath with the Jews, because the Thracians 'worshipped the god Sabazius, who was identified with the Jewish God' (Stern 1974, vol. 1, 96). On Sabazius and his identification with the Jewish God, see §4 below.

The close link between Pythagoras and the Jews is also established in other sources. According to Antonius Diogenes, an early imperial Greek writer of an encyclopaedic novel, 'Pythagoras came also to the Egyptians, the Arabs, the Chaldaeans and the Hebrews, from whom he learnt the exact knowledge of dreams' (Diogenes apud Porphyry, *The Life of Pythagoras* 11; Stern, Nos. 250 & 456a). In line with this picture of Pythagoras' interest in Judaism, there appear to be allusions to the Septuagint in Pythagorean writers such as Ocellus Lucanus (Stern, No. 40) and Pseudo-Ecphantus (Stern, No. 564). Conversely, a Jew such as Josephus could also compare a particular strand of Judaism, that of the Essenes, with Pythagoreanism: Essenes constitute 'a group which follows a way of life taught to the Greeks by Pythagoras' (*Jewish Antiquities* 15.371).[40] These cross-references between Pythagoreans and Jews make it probable that Iamblichus, in his account of Pythagoras' visit to the descendants of Mochos in Syria, in fact identified Mochos with Moses. Just as Alexander Polyhistor and Numenius saw no objection in identifying Moses with Musaeus, Iamblichus felt no hesitation in blending the figures of Moses and Mochos of Sidon.

That is not to say that this identification of Mochos with Moses occurred frequently. Let me make it clear: Jewish and Christian sources which mention Mochos resist such identification, nor do other pagan sources on Mochos reflect Jewish associations with this Phoenician sage. Josephus refers to Mochos as one of the number of Greek and barbarian historians of antiquity who provide external verification for the trustworthiness of Moses' account on the longevity of the patriarchs, thereby implying that Mochos and Moses are not one and the same (*Jew. Ant.* 1.107). The second-century AD Christian philosopher Tatian, in his proof of the early date of Moses, before even the foundation of Troy, also refers to Mochos, who is said to confirm in his Phoenician history, albeit in a indirect way, Moses' antiquity (*Oration to the Greeks* 36–37).[41] Tatian too excludes an identification of Mochos with Moses.

Iamblichus' judaizing portrait of Pythagoras, in which Mochos and Moses are blended, perhaps becomes somewhat more understandable if one takes into consideration the fact that, in Greek sources,

[40] For traces of Pythagorean thought in Judaism, Stern refers to Lévy 1927, 211ff. and Walter 1964, 166ff. (Stern 1984, vol. 3, 33–34).

[41] Eusebius, *Preparation for the Gospel* 10.11.10–11 is dependent on Tatian.

Mochos was not only regarded as a writer on Phoenician history,[42] but was also credited with particular views on creation. According to the Stoic philosopher Posidonius (*c.* 135–*c.* 51 BC), as reports in Strabo and Sextus Empiricus have it, 'the ancient dogma about atoms originated with Mochos, a Sidonian, born before Trojan times' (Strabo, *Geography* 15.2.24–25; Edelstein—Kidd, frg. 285). Mochos regarded atomic bodies to be the primary and most fundamental elements of the cosmos (Sextus Empiricus, *Against the Physicists* I.359–363 [= *Against the Mathematicians/Professors* IX.359–363]). Such views on Mochos will have lent weight to claims that the study of philosophy had its beginning among the barbarians, as Diogenes Laertius asserts in the opening of his compendium on the lives and doctrines of the ancient philosophers; he mentions Mochos as an example (*Lives of Eminent Philosophers* 1.1).

Mochos' purported views on the physical constituents of creation may have facilitated Iamblichus' merging of Mochos with Moses. Iamblichus calls Mochos not only 'prophet', but also 'natural philosopher' (φυσιολόγος). At the same time, Moses was known among Greeks for his creation account, as Numenius demonstrates (frg. 30), and the Jewish god was regarded by the Neoplatonist philosopher Porphyry as the creator of all things (Stern, No. 452). The Jewish god was also called the 'god of the four elements', or the demiurge by the schools of Numenius' fellow-Neoplatonists Iamblichus, Syrianus, and Proclus (Stern, Nos. 467, 544 & 545). Because of his supposed views about the demiurge and creation, Moses was even preferred by Galen to Epicurus (Galen, *De usu partium* 11.14; Stern, No. 376).[43] The fact that Iamblichus himself seems to have characterized the Jewish god as 'the god of the four elements', as a creator god, might have expedited the coalescence of Mochos, as natural philosopher, and Moses, as author of a creation account.

However, from the description of Mochos' atomistic view in ancient sources outside Iamblichus, it is clear that not all ancient authorities subscribed to Iamblichus' view that Mochos and Moses were one and the same. This becomes even clearer if Damascius' late-antique description of Mochos' cosmogonic mythology is taken into account (*De principiis* 3.3.2; 5th/6th cent. AD). Nevertheless, the evidence from

[42] See also Athenaeus, *Deipnosophistae* 3.126A, where Sanchuniathon and Mochos are mentioned together as the historians of Phoenicia.

Iamblichus on Pythagoras' period of study among the descendants of Mochos/Moses, combined with that of Hermippus and Antonius Diogenes on the close connection between Pythagoras and the Jews, shows that a common identity between Mochos and Moses could be established by some, just as Alexander Polyhistor and Numenius did not disapprove of identifying Moses and Musaeus.

3. Iao in Pagan Greek Writings

Having analysed the varied reception which Moses received from pagan Greek authors, I shall now focus on the question of whether these sources show any awareness of the name of Moses' God. We have already come across three relevant instances. (1) First, in first-century BC Rome Alexander Polyhistor included information from Artapanus in his encyclopaedic ethnography, regarded Moses as identical with Musaeus, and narrated at some length the story of God's revelation to Moses. The account describes the powerful impact of the name of the Lord of the universe on the Egyptian king and his entourage as soon as this name was uttered or read from a tablet. (2) Secondly, Diodorus Siculus, a near-contemporary of Alexander Polyhistor, designates the name of Moses' God as Iao, and considers Moses to have ascribed his self-made laws to his God, in accordance with the general custom among ancient peoples. (3) Thirdly, Strabo interprets the Jewish God as 'the nature of all that exists', thereby probably alluding to the ontological meaning of his name. (4) Fourthly, like Diodorus Siculus, Philo of Byblos also mentions the name 'Iao', this time in the form of Ieuo, whose priest Hierombolus is named as the source of Sanchuniathon's history of the Jews, allegedly written before the Trojan War. (5) And fifthly, Numenius shows himself aware of the ontological meaning of Yahweh's name.

Other passages in pagan Greek writers which refer to the name of Moses' God can be added to the list. (6) The first-century medical author Dioscorides mentions Iao's name in a prayer in a work by the name of *On the Peony (Περὶ παιωνίας)*. Dioscorides, who studied under Areius of Tarsus, was known mainly for his extensive *De materia medica*, in which he lists the effects of drugs employed in medicine and alludes to products of Judaea (Stern, Nos. 179–184). In this context, he gives the characteristics of herbs, minerals, and animal products. Although *De materia medica* is characterized as 'relatively free of

https://creativecommons.org/licenses/by-nc-nd/4.0/

supernatural elements, reflecting keen, critical observation of how drugs react,'[44] it is clear that Dioscorides did not entirely reject the supernatural; in the passage in question in *On the Peony* (not mentioned in Stern), Dioscorides implores God as follows: 'Wherever I am in the cosmos, which is subject to me, be thou with me, lord God Iao, Iao' (edn. Zuretti 1934, 166: ὅπου ἄν εἰμι ἐν κόσμῳ ὅς ἐστιν ὑπήκοός μοι, ἔστω μετ' ἐμοῦ, κύριε Θεὲ Ἰάω Ἰάω). This passage shows the degree to which Iao's name was known among the Greeks, and was also invoked by them. This also happens frequently in (7) the Greek magical papyri in late antiquity.[45]

Another occurrence of Iao's name is found in (8) the remaining fragments of Varro, the great Roman scholar from the first-century BC. In a fragment which probably formed part of his *On Human and Divine Matters of Antiquities*, in which he studies the human construction of the divine, Varro says 'that among the Chaldaeans, in their mysteries, he (i.e. the God of the Jews) is called "Iao"' (Varro, edn. B. Cardauns, frg. 17; Stern, No. 75). This passage from Varro, preserved in the sixth-century Lydus from Constantinople, is directly followed in Lydus by a reference to (9) Philo of Byblos, according to whom—Lydus says—'Iao, in the Phoenician tongue, refers to the noetic light' (Lydus, *De mensibus* 4.53 = *FGrH* 790, frg. 7; Stern, No. 324). This addition shows that Philo of Byblos indeed appears to have known the Jewish God not only as 'Ieuo' (as we have seen above; Stern, No. 323), but also as 'Iao'. The actual fragment from Varro serves to underscore the fact that in the first century BC the

[44] Riddle 1996, 483–4.

[45] See the many occurrences in Preisendanz 1928–31, 2 vols, Nos. 1–8, 10, 12–13, 15, 19a, 22ab, 28b, 35–36, 61, 67, 71, 78. See also the *Anthologiae Graecae Appendix: Oracula*, epigram 135 (edn. Cougny 1890), and the *Hymni Anonymi e Papyris Magicis Collecti*, frg. 5 (edn. Heitsch 1963). On the Jewish elements in the magical papyri, see Smith 1996. It is important to notice Gager's observation in this respect: 'the distinction between Jewish and pagan in many cases presents a false alternative. The magical papyri and amulets reveal such a complex interpenetration of different religious vocabularies and ideas that traditional distinctions break down under the overwhelming weight of syncretism. From the perspective of descriptive analysis it is often more accurate to speak of the Jewish or Greek contribution to a syncretistic document than to limit one's assessment of the document as a whole to Jewish or Greek. (. . .) certain individual terms like Iao, Adonai, Sabaoth, and Moses were so embedded in the vocabulary of syncretistic magic that they became permanent elements of the environment and thus were no longer strictly Jewish' (Gager 1972, 136).

information about the name of the Jewish God found its way into various encyclopaedic works: not only those by Alexander Polyhistor and Diodorus Siculus as discussed above, but also Varro himself.

Later in pagan sources, the name Iao is also attested in (10) the fifth-century AD author Macrobius (1.18.19), who claims to have derived this name from the third-century AD history of Romano-Etruscan religion by Cornelius Labeo (Stern, No. 445). In his work *On the Oracle of Apollo of Claros*, Cornelius Labeo discusses a remarkable oracle that called Iao the highest God and characterized him, in winter, as Hades, in spring as Zeus, in summer as Helios, and in autumn as the graceful Iao.[46] This is another instance of the general development in which the name Iao, while barely featuring in Jewish texts, becomes more and more widespread in non-Jewish texts, whether it be pagan accounts of Judaism, pagan theological texts based on theocrasy (such as the Clarian oracle in Cornelius Labeo), Gnostic Christian texts, Orthodox Christian writings, or magical papyri.[47]

From all these instances it becomes clear that the name Iao was fairly well-known in the Graeco-Roman world. Sometimes Iao was also explicitly coupled with the figure of Moses, as we can see from Alexander Polyhistor and Diodorus Siculus. For this reason Celsus even regards Moses as the actual name-giver of the Jewish God. Moses, he says, 'acquired a name for divine power': ὄνομα δαιμόνιον ἔσχε Μωϋσῆς (Origen, *Against Celsus* 1.21; Stern, No. 375). The high degree to which Moses was known is underlined by the fact that the Roman rhetorician Quintilian in *The Orator's Education*, written in the second half of the first century AD, can refer to Moses simply

[46] On this text, see Stern 1980, vol. 2, 411–412; and Schäfer 1997, 52–53, with notes 124–130 on p. 232.

[47] For Gnostic Christian writers, see (the references in) Irenaeus, Origen, the *Testamentum Salomonis*, and Epiphanius. Orthodox Christian writers include Eusebius, Didymus Caecus, Basilius Caesariensis, Cyrillus Alexandrinus, Theodoretus, Joannes Chrysostomus, and Hesychius. Stern also considers the possibility that the name Iao influenced the emergence of the fable that the Jews worshipped a golden ass's head in their sanctuary. This fable comes to the fore in Mnaseas of Patara (Josephus, *Against Apion* 2.114; Stern, No. 28), Diodorus Siculus (*Library of History* 34–35, 1.3: 'a marble statue of a heavily bearded man seated on an ass, with a book in his hands'; Stern, No. 63), Apion (Josephus, *Against Apion* 2.80; Stern, No. 170), and Damocritus (Stern, No. 247). According to Stern, 'the fact that the name Iao, known also to pagan circles as the name of the God of the Jews, is similar in sound to the Egyptian word for ass probably contributed something to the emergence of the fable' (Stern 1974, vol. 1, 98).

as 'the founder of the Jewish superstition', without specifying his name, apparently assuming that this name would already be known to his public (3.7.21; Stern, No. 230). The same assumption is also made by Pseudo-Longinus, who refers to 'the lawgiver of the Jews', without mentioning him by name (*On the Sublime* 9.9; Stern, No. 148).[48]

That Moses was a well-known figure in pagan circles is an important observation which is, for instance, not always sufficiently taken into account in New Testament studies. It means, for example, that when Paul speaks about Moses in his *Letter to the Romans*, his predominantly pagan-Christian readership at the time[49] will have been familiar with Moses not only through the Roman churches, but already in their pagan past. As pagans too they could have entertained an interest in Moses. As we have seen, particularly in Rome they could have come across Moses' name in encyclopaedic works such as those by Alexander Polyhistor, Diodorus Siculus, and Varro. The same applies to Paul's Corinthian epistles, the only other place in his surviving works where he mentions Moses by name. This correspondence was also mainly addressed to a Christian public of pagan origin. The many references to Moses and/or the Jewish God in pagan literature show that knowledge about this topic, if limited, was not restricted to Jewish circles.

Nevertheless, although Moses was such a well-known figure that authors such as Quintilian and Pseudo-Longinus could presuppose their readers to be familiar with him, knowledge of the actual identity of Moses' God will have had its limitations. The most important

---

[48] Cf. Feldman 1993, chap. 8.1, 233–42: 'The Portrayal of Moses by Pagan Writers', esp. 240: 'When Quintilian (3.7.21), at the end of the first century, refers to "the founder of the Jewish superstition," he, like Pseudo-Longinus, does not deem it necessary to name him, because Moses was apparently well-known.'

[49] Paul's Roman public was predominantly of pagan background, since the Jews, including the Christian Jews, had been expelled from Rome by Claudius in AD 49 (Suetonius, *Claudius* 25.4; Stern, No. 307); only after the death of Claudius in AD 54 were they able to return to Rome, but when Paul wrote his letter, in AD 56, the predominant ethnic identity of the Christian communities of Rome to which he wrote must still have been pagan rather than Jewish. Moses is mentioned in *Rom* 5.14, 9.15, 10.5, 10.19, and in the Corinthian epistles in *1 Cor* 9.9, 10.2 and *2 Cor* 3.7, 13, 15. In *2 Tim* 3.8 Moses is mentioned together with the two Egyptian magicians Jannes and Jambres, a tradition which also occurs in Graeco-Roman writers such as Pliny the Elder (*Natural History* 30.11; Stern, No. 221: Moses, Jannes, and Lotapes), Apuleius (*Apology* 90; Stern, No. 361: Iohannes [= Jannes], Moses, and others), and Numenius (frgs. 9, 1c, 10a; Stern, Nos. 365–366: Jannes, Jambres and Moses/Musaeus).

reason for this seems to be the declining willingness of Jews to pronounce and invoke the name of Yahweh. It is very revealing to examine pagan reflections on the lack of readily available information about the Jewish God's identity. First of all, this ignorance was used to cast Judaism into disrepute, by highlighting its secretive, arcane character. According to Juvenal, those pagans who revere the Jewish Sabbath have contempt for the laws of Rome, but 'learn and practise and revere the Jewish law, and all that Moses handed down in his secret tome (*arcano volumine*), forbidding them to point out the way to anyone not worshipping by the same rites' (*Satires* 14.96–103; Stern, No. 301). As Stern observes, 'In labelling the Book of Moses a "secret" work, Juvenal is casting on Judaism the disrepute that attached to esoteric religious societies, while pointing out the danger inherent in its exercise'.[50] In this way, by implicitly comparing Judaism with mystery religions, Juvenal was able to make sense of the lack of knowledge about the Jewish religion, including, we may assume, the name of the god worshipped.

Secondly, a different, more sophisticated strategy used by pagan authors to account for their ignorance regarding the name of the Jewish god involves the concept of the anonymous and unknown God. The first to stress the anonymity of the Jewish God in the evidence still extant is Livy. His view on these matters has only come down to us in reports by later writers, but these show that, according to Livy, the Jews 'do not state to which deity the temple at Jerusalem pertains' (Stern, No. 133: *Hierosolimis fanum cuius deorum sit non nominant*), so that 'the god worshipped there is unknown (ἄγνωστος)' (Stern, No. 134). Interestingly, Livy virtually explicitly says that pagan ignorance of the identity of the Jewish God is due to the reluctance of the Jews themselves to state which deity they worship.

The first-century AD author Lucan is probably dependent on Livy, when he states (from the perspective of Pompey) in *The Civil War (Pharsalia)*: 'My standards overawe Cappadocia, and Judaea given over to the worship of an unknown god' (*incertus deus*; 2.592–593; Stern, No. 191). Or, as Lucan is paraphrased in Lydus: 'In conformity with Livy Lucan says that the temple of Jerusalem belongs to an uncertain god (Ὁ Λούκανος ἀδήλου θεοῦ τὸν ἐν Ἱεροσολύμοις ναὸν εἶναι λέγει)' (Stern, No. 367). The fact that the Jewish God is

called an 'incertus deus' (ἄδηλος θεός) underlines, as Stern puts it, that 'there was no specific name for him in post-biblical times'.[51]

In a similar way, the fourth-century AD authors of the *Historia Augusta* refer to the Jewish God as an 'incertum numen', an uncertain divinity. The context is a discussion about the maximum of man's longevity:

> the most learned of the astrologers hold that 120 years have been allotted to man for living and assert that no one has ever been granted a longer span; they even tell us that Moses alone, the friend of God, as he is called in the books of the Jews, lived for 125 years, and that when he complained that he was dying in his prime, he received from an unknown god (*ab incerto numine*), so they say, the reply that no one should ever live longer (*Scriptores Historiae Augustae: Divus Claudius* 2.4; Stern, No. 526).

Livy, Lucan and the authors of the *Historia Augusta* talk about the Jewish God as an unknown, uncertain god. In Dio Cassius, this is cast in terms of the philosophical consideration that God is even unnameable (cf. Geljon, this vol., §1 on Philo, and at the end of §2 on Gregory of Nyssa). According to Dio Cassius, the Jews do not have a statue of their god in the temple of Jerusalem, but believe him to be 'unnameable and invisible': ἄρρητον δὲ δὴ καὶ ἀειδῆ αὐτὸν νομίζοντες εἶναι (*Roman History* 37.17.2; Stern, No. 406). It is probably this point that the sixth-century AD scholiast Lactantius Placidus wishes to emphasize, in his discussion of the nature of the Highest God. To support his view that the name of the Highest God cannot be known, he refers, inter alia, to the authority of 'Moses, the priest of the Highest God' (Stern, No. 553). In short, all these authors show that Graeco-Roman authors could interpret their lack of knowledge about the name of the Jewish God in terms of the well-established concept of the uncertain, unknown, unnameable God.[52]

Authors who did have knowledge about the name of the God of the Jews demonstrate, as we have seen, that this name was applied

---

[51] Stern 1974, vol. 1, 439. Stern also points out that the 'concept of *di incerti* is found already in Varro's terminology, where he used it for those gods of whom he had no clear knowledge (. . .). Varro did not, however, include the Jewish God among the *incerti*.' Indeed, as we have seen above, Varro calls him 'Iao' (Varro, frg. 17 edn. Cardauns; Stern, No. 75).

[52] On the concept of the unknown God, which is also applied in Acts 17:23, see Norden 1913; Gärtner 1955, chap. 9, 242–247; Des Places 1959; Wycherley 1968; Van der Horst 1988 and 1989; Henrichs 1994; and Carabine 1995.

in magic (see Alexander Polyhistor on the Name's magical influence and, explicitly, the Greek magical papyri),[53] prayers (Dioscorides), 'mysteries' (Varro: 'among the Chaldaeans, in their mysteries'), and oracles (Cornelius Labeo). The link between the name 'Iao' and magic seems to be an instance of the much wider association of Jews with magical practices in Antiquity. According to Pliny the Elder, there is a 'branch of magic, derived from Moses, Jannes, Lotapes and the Jews' (*Natural History* 30.11; Stern, No. 221; cf. Burnyeat, this vol., §2 note 20), and Apuleius mentions Moses by name among other prominent magicians (*Apology* 90; Stern, No. 361). Likewise, Celsus points out that the Jews 'are addicted to sorcery, of which Moses was their teacher' (Celsus apud Origen, *Against Celsus* 1.26 and cf. 5.41; Stern, No. 375), Lucian of Samosata talks about foolish people who 'fall for the spells of Jews' (*Tragodopodagra* 173; Stern, No. 374), and Damascius narrates the story of the wife of the Neoplatonist philosopher Hierocles, from whom a bad spirit was expelled by the invocation of 'the rays of the sun and the God of the Hebrews' (Stern, No. 547; cf. also Van den Berg, this vol., §§3–5 on Origen and the Neoplatonists on the power of divine names in magical spells). This kind of acknowledgement of the power which the Jewish God exerts over spirits seems also to be reflected in Porphyry's statement about the 'one true God, the creator and the king prior to all things, before whom tremble heaven and earth and the sea and the hidden places beneath, and the very divinities shudder; their law is the Father whom the holy Hebrews greatly honour' (Porphyry apud Augustine, *The City of God* 19.23; Stern, No. 451). As Augustine, who preserves this passage, remarks: 'In this oracle of his own god Apollo, Porphyry cites the God of the Hebrews as being so great that the very divinities shudder before him'. In all likelihood, this prominence of the Jewish God in magical applications, prayers, mysteries, and oracles has chiefly to do with the importance attributed to his name.

[53] Cf. Feldman 1993, chap. 8.4, 285–7: 'Moses the Magician', esp. 287: 'In particular, it is Moses' alleged knowledge of the Divine Name (*Papyri Magicae Graecae* 5.108–18) and of the Divine mysteries which made him so important. Thus, knowledge of the Divine name was thought to make possible the performance of miracles'.

4. Sabaoth in Pagan Greek Writings

In Hebrew Jewish writings, as well as 'Yahweh', the God of the Jews was also often called 'Yahweh Sabaoth' in full. Although this name never occurs in pagan writings in its full, composite form as 'Iao Sabaoth', 'Sabaoth' does indeed occur by itself on several occasions. An examination of these passages will conclude our investigation into Greek familiarity with the revelation of God's name to Moses.

The first surviving evidence seems to be contained in the passage from Varro and Philo of Byblos in the sixth-century AD author Lydus, which has already been discussed (Stern, Nos 75 & 324). Lydus not only supplements his fragment from Varro on Iao with the explanatory remark that Philo of Byblos regards 'Iao' as a Phoenician name referring to the noetic light.[54] He also adds that Iao 'is also often called Sabaoth,' which stands for 'he who is above the seven celestial spheres, i.e. the creator': καὶ Σαβαὼθ δὲ πολλαχοῦ λέγεται, οἷον ὁ ὑπὲρ τοὺς ἑπτὰ πόλους, τουτέστιν ὁ δημιουργός (*FGrH* 790, frg. 7).

A very striking case, further, is offered by Plutarch in a discussion, in his *Table-Talk*, on the question: 'Who is the God of the Jews?' In this discussion, one proponent, the Athenian Moeragenes, argues that Dionysus and the God of the Jews have much in common, are in fact even identical, as is apparent when their rites and festivals are subjected to phenomenological comparison. Their similarities, Plutarch's proponent argues, relate also to the Jewish Sabbath: 'Even the feast of the Sabbath is not completely unrelated to Dionysus' (*Table Talk* IV.6, 671C–672C; Stern, No. 258). This identification between the Jewish God and Dionysus (or Liber Pater, the Italian god of fertility and wine, commonly identified with Dionysus) is also made in Tacitus (*Histories* 5.5; Stern, No. 281), and in Cornelius Labeo: 'the explanation of the deity and the name by which Iao is denoted Liber Pater and the sun [is] expounded by Cornelius Labeo in a book entitled *On the Oracle of Apollo of Claros*' (Cornelius Labeo apud Macrobius, *Saturnalia* 1.18.18, 21; Stern, No. 445).

The logic which underlies this identification of the Jewish God with Dionysus is apparently as follows, as Herbert Hoffleit explains:

[54] On this Platonist concept of the true, noetic light, see Van Kooten 2005a, 151–62, esp. 156–7 on the passage in Lydus under consideration.

> When the Hebrews spoke of *Sabaoth* (. . .) they would seem to a Greek to be referring to *Sabazios* or *Sabos*, who was identified with Dionysus. The Romans in 139 BC put themselves on record officially as guilty of the same confusion by expelling the Jews for allegedly introducing Sabazios to Rome.[55]

The later observation is based on Valerius Maximus, according to whom praetor Cnaeus Cornelius Hispalus, who had 'ordered the astrologers by an edict to leave Rome and Italy', also 'compelled the Jews, who attempted to infect the Roman customs with the cult of Jupiter Sabazius, to return to their homes' (*Memorable Deeds and Sayings* 1.3.3; Stern, No. 147b).[56] Stern summarizes this explanation of the interchangeability of Sabaoth and Sabazios as follows: 'the similarity of the name Sabazius to that of the Jewish Sabaoth (. . .) induced an identification with the Jewish God'. Yet he also mentions the possibility of explaining 'the connection between the Jewish God and Sabazius by the conception of Sabazius as the God of the Sabbath'.[57] In any case, in Greek sources, not only could Moses be identified with Musaeus and Mochos, Yahweh himself was thought to share a common identity with Jupiter Sabazius and Dionysus.

That this is possible from the Greek perspective is confirmed by passages from Varro and Celsus. Varro, as Augustine reports, 'thought the God of the Jews to be the same as Jupiter, thinking that it makes no difference by which name he is called (*nihil interesse censens, quo nomine nuncupetur*), so long as the same thing is understood' (Varro apud Augustine, *On the Agreement of the Evangelists* 1.22.30; Stern, No. 72b). According to Celsus, 'The Goatherds and shepherds (the Jews, that is) thought that there was one God called the Most High, or Adonai, or the Heavenly One, or Sabaoth.' In Celsus' view, however, 'it makes no difference whether one calls the supreme God by the name used among the Greeks, or by that, for example, used among the Indians, or by that among the Egyptians' (Celsus apud Origen, *Against Celsus* 1.24; Stern, No. 375). Or as Origen reports Celsus' view elsewhere: 'it makes no difference whether we call Zeus the Most High, or Zen, or Adonai, or Sabaoth, or Amoun like the Egyptians, or Papaeus like the Scythians' (5.41; Stern, No. 375).

Origen's reaction and the background to Celsus' view is the topic of Robbert van den Berg's paper in this volume. It will suffice here to underline that identifications between Yahweh Sabaoth and Dionysus were considered possible on the general principle that, in the final instance, all (major) gods bear one and the same identity.[58] For the same reason, pagan Greeks also made abundant use of the names Iao, Sabaoth, and Adonai, as is shown by the Greek magical papyri.[59]

5. Conclusions

This paper has focused on the Graeco-Roman knowledge of Moses and the name of his God, Iao, Sabaoth, or Adonai. These names are specifically Jewish designations for God, yet they were apparently known to, and even taken over by Greeks.[60] Moses and the name of his God did not remain hidden in the Greek world. In pagan sources, this disclosure did not occur exclusively, or even predominantly, in an anti-Semitic context. The entire reception of Moses and the name of his God was greatly varied. Graeco-Roman authors were vague and inconsistent in such matters; they had no need for consistency. Apart from negative interpretations in primarily Egyptian sources, and ample applications in magic, Moses and his God also received a remarkably positive reception in authors who stressed

[58] On the various ways in which Iao was incorporated into the pagan Graeco-Roman pantheon, see also Bohak 2000, 4–11.

[59] For 'Sabaoth', see Preisendanz 1928–31, 2 vols, Nos. 2–10, 12–13, 13a, 15–16, 18a, 21, 22ab, 28ab, 32a, 35–36, 42–43, 47, 59, 67. Cf. also Zosimus of Panoplis (fl. *c.* AD 300), author of a book on the God of the Hebrews, the Lord of Powers Sabaoth (edn. Berthelot & Ruelle 1888), the *Hymni Anonymi e Papyris Magicis Collecti*, frg. 5 (edn. Heitsch 1963) and particular astrological writings accessible via TLG searches. For 'Adonai', see Celsus in Origen, *Against Celsus* 1.24 and 5.41; Preisendanz 1928–31, 2 vols, Nos. 1–5, 7–8, 10, 12–13, 22b, 28c, 32a, 35–36, 43, 57, 62, 68; the *Hymni Anonymi e Papyris Magicis Collecti*, frg. 5 (edn. Heitsch 1963); and several astrological writings in the TLG corpus.

[60] This study could be further extended to other designations for God which were frequent among the Jews: Pantokrator and Theos Hypsistos. Although these terms were not specifically Jewish, and even originated in Greek writings, Jews seem to have had a specific preference for them, and this intensity in itself became influential in the Greek world. On 'Theos Hypsistos', see Mitchell 1999, esp. §5, 110–15: 'Theos Hypsistos and the Jews'. See, e.g., 112: 'most "pagan" or "Jewish" examples of the term Theos Hypsistos are formally indistinguishable from one another', and 114: 'We are evidently dealing with an area of belief where Jews, judaizers, and pagans occupied very similar territory.'

Moses' outstanding wisdom and philosophical, aniconic theology (Hecataeus; Diodorus Siculus; Strabo), identified him with no lesser than Musaeus (Alexander Polyhistor; Numenius), made Pythagoras dependent on the mysteries of Moses-Mochos (Iamblichus), and characterized Moses' God, in an ontological way, as 'He who is' (Numenius), as 'the noetic light' (Philo of Byblos), and 'the highest God' (Cornelius Labeo); they considered him unnameable and invisible (Dio Cassius), called him the 'one true God' (Porphyry), 'He who is above the seven celestial spheres, i.e. the creator' (Philo of Byblos), and named him not only 'Iao' and 'Sabaoth' but also 'Dionysus' (Plutarch) and 'Jupiter Sabazius' (Valerius Maximus). What is perhaps most remarkable about this positive reception is that we are surprised about it.[61]

THE HISTORICAL SIGNIFICANCE OF THE DIALOGUES BETWEEN JEWISH SAGES AND ROMAN DIGNITARIES*

MOSHE DAVID HERR

I

The following incident is recorded in a Baraita preserved in midrashic literature:

> It was told that when Hadrian went up the ascent of Ḥamat גדר,[1] he found a little Jewish girl on the peak of Ḥamat גדר. He asked her: Who are you? She replied: I am a daughter of Israel. Immediately he descended from his carriage and bowed down to her. All the dignitaries of the kingdom became angry with him. They said: Why did you see fit to debase yourself and bow down to this despicable creature who is soiled and filthy? He said to them: Fools! Are not all nations destined to bow to them? — For so it is written: *So says the Lord, the Redeemer of Israel. . .*[2]

* An abridgement of a chapter from a dissertation submitted in fulfilment of the requirements for the degree of Doctor of Philosophy at the Hebrew University, prepared under the direction of Professor E. E. Urbach, to whom the author extends his gratitude and appreciation. This version was read as a paper at the fifth world Congress of Jewish Studies, Jerusalem, 1969.

Quotations from rabbinic literature have been culled from the critical editions listed below (all page numbers referring to these editions):

Tosefta Zera'im; Mo'ed	— ed. Lieberman
Mekhilta (de R. Ishmael)	— ed. Horowitz–Rabin
Mekhilta de R. Simeon b. Yoḥai	— ed. Epstein–Melamed
Sifre, Zuta	— ed. Horowitz (Leipzig, 1917)
Sifre, Deut.	— ed. Finkelstein
Midrash Tanna'im (Deut.)	— ed. Hoffmann
Genesis Rabba	— ed. Theodor–Albeck
Leviticus Rabba	— ed. Margulies
Pesiqta de R. Kahana	— ed. Mandelbaum
Massekhet Derekh Ereẓ	— ed. Higger
Pesiqta Rabbati	— ed. Meir Ish-Shalom (Friedmann)
Seder Eliyahu Zuta	— ed. Meir Ish-Shalom (Friedmann)
Genesis Rabbati	— ed. Albeck

[1] Should read *Gader*, and so too below. This city with its natural hot springs (the present-day El Ḥamma) was located on the bank of the Yarmukh river, north of the city Gader.

[2] *Midrash Tanna'im* XXVI 19 (collected from *Midrash Ha-Gadol*), p. 262.

At first sight, the episode seems odd, even questionable. What would Hadrian, the "cosmocrator", the ruler of the world, have to do with a slovenly Jewish girl in Ḥamat Gader? Further reflection reveals, however, that the story is not at all as far-fetched and fantastic as it seemed at first. In the *Historia Augusta*,[3] Hadrian is described in these terms:

> In conloquiis etiam humillimorum civilissimus fuit, detestans eos qui sibi hanc voluptatem humanitatis quasi servantes fastigium principis inviderent.
>
> Most polite in his conversations even with the most humble, he detested those who, in the belief that they were thereby maintaining the imperial dignity, begrudged him the pleasure of such friendliness.

Furthermore, Hadrian did seemingly travel along the ascent of Ḥamat Gader, either on his way to southern Transjordan in the winter of 129/130 C.E., or else on his return from Egypt by way of Judaea to Syria in 131 C.E. Here is confirmation of almost the complete background of the episode. We may thus conclude that Hadrian acted kindly towards the child, not because she was Jewish, but precisely because she was despised. This assertion may well be challenged. We might be accused of drawing unwarranted conclusions from the material, since both sources are unreliable! To this contention, we reply that this is precisely our argument. Of itself, each source is, obviously, highly doubtful. But the two are totaly independent of each other. No one has ever had the temerity to suggest that any connection could exist between a fourth century Roman historian of Antioch and R. David b. 'Amram Al 'Adeni, the Yemenite compiler of Midrashim, who lived some 1,000 years later. *Volens nolens*, the one source tends to confirm the other.

Let us now take up our topic more systematically. It is reasonable and even inevitable for certain social relationships to arise between conqueror and conquered, between rulers and their subjects. Certainly the Rabbis of the Talmud and the "Roman dignitaries" of the times were no exception to this rule. Yet even where these relations do not develop into definite social ties, nevertheless contacts with one another by word of mouth do certainly exist. Sometimes these talks do not extend beyond the necessities imposed by prevailing circumstances, and do not arise from the free will of the parties involved. At other times, however, the two sides engage in discussions voluntarily.

Rabbinic literature has preserved many accounts of dialogues between the Talmudic Sages and eminent Romans. Especially famous are the numerous verbal encounters, scattered throughout the sources, between

[3] Spartianus, *Vita Hadriani* XX 1.

R. Yoḥanan b. Zakkai and a certain prefect (hegemon), between R. Joshua b. Ḥananiah and Hadrian (or else "the Emperor", without any closer identification) and his daughter, R. Akiva and Tineius Rufus, R. Yose b. Ḥalafta and a Roman matron, Antoninus and R. Judah, the Patriarch. In the past, scholars have generally felt impelled in some such instances to take up mainly the question whether the accounts were *verbatim* reports of actual conversations. They also dealt with the problem of the identity of the interlocutor where he was not designated by name or else equivocally (Antoninus, Antigonos hegemon), or by title only.

It cannot be confidently asserted that satisfying answers to these two questions were generally forthcoming. Not only has scholarship failed to arrive at any definite solution to the problem of whether a specific conversation really took place, but even the efforts to indentify certain of the participants were unsuccessful, as the case of Rabbi Judah and Antoninus so clearly demonstrates.

Now, conversations of these types were not confined to the world of the Jewish Sages. Similar episodes are to be found amongst other peoples as well. Especially well known are the dialogues between philosophers (Stoics, Neo-Pythagoreans, and especially Cynics), Greek gymnasiarchs and gymnosophists, on the one hand, and Roman Emperors and officials on the other. Here, too, the question of the reality behind the accounts poses itself. Already at the beginning of the Hellenistic period, the phenomenon appears in the Greek world of a philosopher engaging in a dialogue with a ruler, and it reached its peak at the end of the first, and during the second, century C.E. Rabbinic literature, too, furnishes evidence that discussions between Sages and Roman leaders proliferated in the same period. Undoubtedly the two phenomena, the Graeco-Roman and the Jewish, are interrelated. Like their gentile counterparts, Jews, too, engaged in discussions with members of the Roman leadership.

In our opinion, the important question is not whether the event actually occurred, but whether it *could* actually occur (i.e. the *possibility* of the particular conversation having occurred). In other words, study should have been devoted to the subject matter of the conversations, and the inquiry should not be confined to the totality of the dialogues but to each pair of conversationists in turn. There is no justification for any *a priori* assumption that what interested one pair should also occupy the attention of two other persons speaking to each other.

To suggest, however, that such incidents never occurred in reality and were pure figments of the imagination is certainly out of the question. On the contrary, the historical existence of such conversations has been abundantly confirmed by the evidence of gentile historians, whose reliability is

unassailable. Nevertheless it is also undoubtedly true that, side by side with this historical phenomenon, a literary genre has also arisen.[3*]

As has already been stated above, literary accounts of dialogues between philosophers and rulers had made their appearance as early as at the beginning of the Hellenistic period.[4] That a similar literary genre made its appearance in Israel, too, at about the same time is proved by the account of the conversations conducted by the elders of Judaea with Ptolemy Philadelphos to be found in the *Pseudo Aristeas*.[5] It is highly questionable whether these conversations ever really took place. Yet, extant Jewish-Hellenistic literature contains evidence of certain conversations which actually occurred as recorded.[6] A full description of this type of dialogue is found in Philo's *Legatio ad Gaium*. Philo had headed a delegation of Alexandrian Jews which sailed to Rome to intercede with Gaius Caligula. The work recounts in detail how the Emperor received the members of the deputation, who were forced to rush after him from Rome to Puteoli and back again to Rome. The decisive talk occurred at the time of the Emperor's visit at the gardens of Maecenas,

[3*] On distinguishing between the two phenomena — the real and the literary — see now H.A. Fischel, "Story and History: Observations on Greco-Roman Rhetoric and Pharisaism", *American Oriental Society, Middle West Branch, Semi-Centennial Volume*, ed. D. Sinor, Bloomington 1969, p. 66.

[4] We refer to the famous dialogue between Alexander the Great and the sage Kalanos. See W.W. Tarn, *The Greeks in Bactria and India* (Cambridge 1938), pp. 414–436; cf. Breloer-Bremer, *Fontes Historiae Religionum Indicarum*. On the meeting between Alexander and Diogenes, see Plutarch, "Alexander" XIV 2; Diogenes Laertius, *Vitae Philos.* VI 38; cf. W.W. Tarn, "Alexander, Cynics and Stoics", in *American Journal of Philology* LX (1939), pp. 49–70. It is interesting that rabbinic literature, too, has preserved accounts of dialogues between Alexander and the Jewish Sages. Only a few of these reputed encounters have a real historical background (see J. Gutman, "Alexander of Macedon in Erez Israel", *Tarbiz* XI (1940), pp. 271–294, Hebrew). Most are legendary, connected with the general development of the "Alexander Romance"; see L. Wallach, "Alexander the Great and the Indian Gymnosophists in Hebrew Tradition", *PAAJR* XI (1941), pp. 47–83.

[5] *Letter of Aristeas*, 173–181, 187–294. See also J. Gutman, "The Origin and Principal Purpose of the Letter of Aristeas", *Ha-Goren* X (1928), p. 46 (Hebrew). Tarn (*op. cit.*, above n. 4) gave an enlightening evaluation of the connection between *Milindapañha* (the work recounting the conversation between Alexander and the Indian Gymnosophists) and the *Letter of Aristeas*.

[6] Clearly "as recorded" in ancient literature does not mean *verbatim*. A cursory comparison of Herod's speech before the battle with the Arabs, quoted in *The Wars of the Jews* (I 19,4), and the same speech as reported in the *Antiquities* (XV 5,3) is sufficient to prove how much the words actually uttered were subjected to literary editing even by one and the same historian. Other examples abound in classical literature. Perhaps the most instructive instance of all is the comparison of Claudius' speech on the granting of "Italian" rights to the inhabitants of southern Gaul as reported in Tacitus' *Annals* (XI 24) and the text of the inscription containing this granting discovered in Lugdunum. (My thanks are due to Professor M. Stern who drew my attention to this example.)

near Rome, while he was examining the state of the orchards and houses. There Caligula kept rushing back and forth, from one palace to another, from room to room, while the hapless Jews had to "follow him, running up and down". The conversation did not only deal with the relations between Jews and Greeks in Alexandria and the graven image Gaius intended to instal in the Temple in Jerusalem. Philo relates that Caligula, after he had issued instructions about the buildings, turned to the members of the delegation with the grave and momentous question: "Why do you refuse to eat pork?" This question was greeted by an "outburst of laughter" from the Greeks present, since the Jewish prohibition against the eating of pork had been given prominence in Alexandrian antisemitic literature.[7] The Jews answered as best they could, for which the Emperor mocked and reviled them in return. And so the conversation passed from one topic to another.[8]

Apart from his particular madness, Caligula was not much different from other Roman Emperors. They, as well as lesser government officials, both in the metropolis and the provinces, used to converse quite indiscriminately even with those accustomed to curse them.[9]

II

Our study will begin chronologically, with R. Yoḥanan b. Zakkai. The sources provide us with information on his conversations with two outstanding Romans: Vespasian and a certain "hegemon" (prefect).

Rabbinic tradition relates that after R. Yoḥanan b. Zakkai had escaped from Jerusalem and had fallen into the hands of the Romans, he came before Vespasian. It is not within the purview of this article to inquire into the rabbi's attitude to the Roman government and the rebellion as such. Nor is it in place here to analyse the variants in the four main accounts[10] of the conversation between R. Yoḥanan and Vespasian.[11] Suffice it to say that

[7] See Reinach, *Textes d'auteurs grecs et romains relatifs au Judaism*, Index, *s. v.* "porc".

[8] Philo, *Legation to Gaius*, Chs. XXVIII–XXIX, XLIV–XLV (180–186, 349–376).

[9] Suetonius' work is a veritable treasure house of gossip on the first twelve Emperors, regarding both this topic as well as others. See e. g. *Vita Vespasiani* XIII. As for the second and third centuries C. E., a similar source, though to be used more carefully and reservedly, is provided by the collection entitled *Scriptores Historiae Augustae* (cf. n. 1 above, and n. 87 below); see, now, R. Syme's excellent work, *Ammianus and the Historia Augusta* (Oxford 1968).

[10] *Avot de R. Natan*, A, IV; B, VI; *Lam. Rabba* i:5; B.T. Gittin 56a–b.

[11] See G. Allon, "R. Yoḥanan b. Zakkai's Journey to Jabneh" *Zion* III (1938), pp. 183–214 (Hebrew) = *Meḥqarim be-Toledot Israel*, Vol. I (1957), p. 219–252; E.E. Urbach, "The Jews in their own Land in the Tannaitic Period" *Beḥinot* IV (1953), pp. 63–64 (Hebrew). J. Neusner's *A Life of Rabban Yoḥanan b. Zakkai* (Leiden 1962), pp. 104–128 contains nothing really new.

there can be no doubt whatsoever that the confrontation could very well have taken place.[12] Furthermore, it is most probable that such a meeting did actually occur. Once R. Yoḥanan had left Jerusalem, he reached Vespasian's camp. There he prophesied that Vespasian would become Emperor and begged a favour of the Roman, apparently to ensure the survival of rabbinic Sages. All sources concur so far. The topics dealt with by the two are most characteristic. "Prophecies and predictions" that Vespasian was indeed destined to occupy the imperial throne had become quite rife in the East during the period immediately prior to his accession.[13] Hence the tradition that R. Yoḥanan, too, had foretold this event should not be lightly dismissed. It is told of Apollonius of Tyana that he, too, addressed Vespasian as *domine imperator* even before the latter had assumed royal office. The situation also requires the assumption that some petition for the rescue of the Sages should have been addressed to Vespasian. The only question that remains to be settled is the date of the conversation — when could it take place? Apparently R. Yoḥanan spent some time in the Roman camp[14] during June and early July of 69 C.E.[15]

At about the same time, there must have taken place the conversations between R. Yoḥanan b. Zakkai and a certain "prefect" (hegemon), whose name appears in our sources as אגנטוס[16], אנטונינוס[17], אנטיגנס[18], אגנטם[19]

[12] These remarks are in refutation of the view of A. Kaminka, *Meḥqarim Ba-Talmud* (1951), pp. 99–100. He asserted that the meeting never took place. Cf. also G. Allon, in his study referred to above (n. 11), p. 188.

[13] See Suetonius, *Vespasianus* V–VI; Josephus, *Wars* III 8, 9; Tacitus, *Historiae* II 78; Philostratos, *Apolonius of Tyana*, V, 27 ff., especially 31; cf. Kenneth Scott, *The Imperial Cult under the Flavians* (Stuttgart-Berlin 1936); the author was apparently totally unaware of the incident involving R. Yoḥanan b. Zakkai.

[14] On the question whether R. Yoḥanan b. Zakkai met with Vespasian or Titus, see Allon's study mentioned above (n. 11), pp. 187–188, and the bibliography referred to there, n. 15. Those who believe that the rabbi spoke to Vespasian (and not to Titus) appear to be correct, even though other elements, pertaining to Titus and the siege of Jerusalem, were also incorporated in the story.

[15] It is possible to determine the time by referring to the tradition preserved in *Lam. Rabba* i:5, that Vespasian went to Gophna. This locality was conquered not earlier than the 5th of Sivan 69 C.E. (*Wars* IV 9,9), while the legions already proclaimed Vespasian Emperor on 1 July, 69. It is accordingly possible to amend the statements of Allon (in his above-mentioned study, *loc. cit.*, above n. 12); of Neusner, in his work mentioned in n. 11, p. 109 and of others, that R. Yoḥanan left Jerusalem as early as the spring of 68 C.E. In his same study, n. 51, Allon himself accepts the tradition concerning Gophna, yet seems completely unaware of the resulting discrepancy in the dates according to his ssytem.

[16] P.T. Sanhedrin I 19b. Cf. also the forms אגיטוס and אגיטים in the various versions in *Sifre*, Deut., mentioned below in n. 25.

[17] *Ibid.*, 19c. [18] *Ibid.*, 19d.

[19] *Ibid.* Genizah Ms. (see Louis Ginzberg, *Seridey Ha-Yerushalmi*, p. 256).

הרנגטים[20] and even קונטריקוס.[21] The sources record three discussions between this prefect and R. Yoḥanan b. Zakkai — concerning the putting to death of the owner of the condemned, goring ox,[22] the census of the priests and Levites in the desert,[23] and the sum of the coins collected from the half-sheqel levy in the desert.[24] In addition, this same prefect is also reported to have held some discussion with R. Gamliel concerning the Written Law and the Oral Law.[25] It is doubtful, however, whether participation in other conversations with R. Yoḥanan b. Zakkai can be attributed to him.[26] All three dialogues entered into by the hegemon with R. Yoḥanan contain sharp criticism of the Torah or of Moses. The questioner seeks to prove that the Torah perverts justice, and that Moses, by whose hand the Torah was transmitted to Israel, was either a thief or else could not do arithmetic. It is a well known fact that both matters — the nature of the Torah and the personality of Moses — were of intense interest to gentiles during the Hellenistic and Roman eras.[27] Still, it seems that here there was also another purpose in these accusations. Mockery of the Torah and Moses, i.e. the attempt to prove that Jews were deceitful and their religion and laws perverted, is well known from other sources as well. The choice of subjects, however: capital punishment, the census and the contributions towards the building of the Tabernacle, call for explanation.

[20] *Num. Rabba* iv:9.

[21] Bekhorot 5a.

[22] P.T. Sanhedrin I 19b.

[23] *Ibid.*, 19c; Bekhorot 5a; *Num. Rabba* iv:9.

[24] P.T. Sanhedrin I 19d; Bekhorot 5a.

[25] *Sifre*, Deut. 351 (p. 408).

[26] Since the conversation concerning the half-sheqel contributions in the desert begins with "And again he asked him. . .", some conjecture that the dialogue between the anonymous Sage and the anonymous "hegemon", which also commences with "And again he asked him. . .", and in which too the argument of the hegemon was brushed aside (Ḥullin 27b) was also an encounter between R. Yoḥanan b. Zakkai and the same prefect (See Tosafot, Ḥullin 27b, *s.v.* "*ve'od she'alo*"). A more thorough investigation is, however, necessary to determine whether such an assumption is justified, for a similar question was indeed addressed to R. Yoḥanan b. Zakkai (*Gen. Rabba* xvii:4, p. 155), but by an *anonymous* inquirer. We do not accept Bacher's opinion (see *Agada der Tannaiten*, Strassburg 1903[2], I, pp. 37–38) as conclusive, viz., that this hegemon is the same person as the "certain gentile" who questioned R. Yoḥanan b. Zakkai on the red heifer and was also summarily brushed aside (*Pesiqta de R. Kahana*, Parah 7, p. 74).

[27] As for Moses, it is sufficient to refer to the sources enumerated by Reinach, *op. cit.* (n. 7), Index, *s.v.* "Moïse"; as far as the Torah is concerned, see the sources mentioned in my article, "Anti-Semitism in the Roman Empire viewed in the Light of Rabbinic Literature", in *Benjamin de Vries Memorial Volume* (Jerusalem 1969), pp. 153–155 (Hebrew).

As has been stated, no unaminity has been achieved by scholars in their attempts to identify this prefect.[28] The name which occurs in various forms, as we have seen above, affords us no decisive clue. There is no doubt that the word ἡγεμών signifies the governor of a province or the like. The most plausible of all conjectures is Schlatter's,[29] viz. that the person in question was Marcus Antonius Julianus, the procurator (ἐπίτροπος) of Judaea at the time of the destruction of the Temple, who served under the legate Sextus Cerealis. He had participated in the decisive meeting convened by Titus to determine the fate of the Temple when its capture seemed imminent.[30] Minucius Felix mentions a work by Julianus on the Jews, side by side with Josephus' writings.[31] Apparently, in preparing his work, Antonius Julianus evinced a keen interest in the laws and customs of the Jews about which he could have read in the Septuagint. Furthermore, as procurator, he was obliged to conduct a census of the inhabitants of conquered Judaea and their possessions — an ordinary and common procedure in every conquered territory or newly created province. In the course of this activity,[32] suspicions must have arisen of Jewish attempts to deceive the census-takers. Hence the conversations dealing with the census and contributions in Moses' time fit very well into the context of those times.[33] Undoubtedly, the legal status of the Jews and their courts must also have been brought up for reconsideration. For that reason, it appears, an investigation, though somewhat superficial, of Jewish criminal procedures, was instituted. Against this background the mention of the case of the owner of an ox which gored a human being to death becomes clearly understandable.[34] Nothing, then, prevents us from assuming

[28] E. Schürer, *Geschichte des jüdischen Volkes...* (1901), Vol. I, p. 649; Krauss, *Lehnwörter*, Vol. II, *s.v.* "אנטיטוס" pp. 10, 595; A. Büchler, *The Economic Conditions of Judaea after the Destruction of the Second Temple* (London 1912), p. 57; Neusner, *op. cit.* (n. 11 above), pp. 168 ff.; S. Safrai, "On the Problem of the Status of the Province of Judaea after the War of the Destruction", *Zion* XXVII (1962), p. 219, n. 21 (Hebrew). (All these studies list additional bibliographical material.)

[29] A. von Schlatter, *Zur Typographie und Geschichte Palästinas* (1893), p. 402. Antonius Julianus was not a ἡγεμών but an ἐπίτροπος, but it seems, that the title "hegemon" in rabbinic literature has a broader connotation than merely legatus, see Krauss, *Paras Ve-Romi Ba-Talmud U-Va-Midrashim* (Jerusalem 1948), pp. 137–138.

[30] *Wars* VI 4,3.

[31] See Reinach, *op. cit.* (n. 7 above), p. 294.

[32] The project in Judaea was completed, apparently, only after the legate Cerealis was replaced by Bassus, and the procurator, M. Antonius Julianus, by Liberius Maximus (See *Wars* VII 6,6). There is no doubt, however, that the work was begun by Antonius Julianus.

[33] J. Gutman has already set down the main points, *Encyclopaedia Ivrit*, Vol. VI, *s.v.* "*Ereẓ Israel*", pp. 393–394.

[34] G. Allon is correct in maintaining that the conversations "afford no proof of any official recognition having been granted to the Bet Din" of R. Yoḥanan b. Zakkai

that conversations between R. Yoḥanan b. Zakkai and Antonius actually did take place.[35] After his stay in Vespasian's camp in June and July 69 C.E., R. Yoḥanan b. Zakkai apparently repaired to Jabneh, which was also in Roman hands, during the summer of that year. By that time, apparently, the Romans realized that, of all Jewish leaders who did not participate actively in the rebellion, R. Yoḥanan was the only one who might in time prove acceptable to a considerable segment of the population. (This would not have been true of people like Agrippa II and Berenice, or Josephus who were regarded by their people as traitors since they had given real positive aid to the Romans, unlike R. Yoḥanan who had apparently refused to take any part in the struggle on either side.)[36] Most probably, then, the conversations between R. Yoḥanan and Marcus Antonius Julianus could have been held between June 69 and the end of 70 C.E. The only challenge to this identification of the time and place is posed by the tradition that the same official also engaged in discussions with R. Gamliel.[37] Such an encounter could not possibly have occurred at the time of the destruction. Yet the difficulty is only apparent — since it seems that the man who spoke with R. Gamliel (or perhaps even with R. Yoḥanan b. Zakkai himself) is none other than "Agrippa, the military commander".

This Agrippa was the one who asked R. Gamliel how it was possible for

(*Toledoth Ha-Yehudim Be-Ereẓ Israel Bi-Tequfat Ha-Mishnah Ve-Ha-Talmud* [1953] Vol. I, p. 60, n. 25).

[35] Allon, *ibid.*, denies all authenticity to the dialogues in question. Neusner (*op. cit.* above, n. 11, p. 168) notes that all that is known about Antonius Julianus' work on the Jews is a single sentence cited by Minucius Felix. He accordingly refuses to accept the "identification" with the hegemon on such scanty evidence, especially since the conversations contain no condemnation of the revolt of the Jews, but are in the main "the kind of exegetical debates common to the period". The identification of Antonius Julianus as the "hegemon", however, does not rest upon the single sentence in Minucius Felix' work at all, but on the *contents* of the conversations and expecially their particular charateristic features, all of which Neusner utterly failed to discern.

[36] This premise agrees with the opinion of Urbach, viz. that the evaluation of R. Yoḥanan b. Zakkai is not to be reduced to the proportions delineated by G. Allon. See E. E. Urbach, "The Jews in their own Land in the Tannaitic Period", *Beḥinot* IV (1953), pp. 63 ff. (Hebrew). Cf. also idem, "Class Status and Leadership in the world of the Palestinian Sages", *Proceedings of The Israel Academy of Sciences and Humanities*, Vol. II, (Jerusalem 1968), pp. 54–55.

[37] *Sifre*, Deut. 351 (p. 408). There, the hegemon is stated to have asked him how many Torahs were given to Israel. However, in *Midrash Tanna'im* (collected from the *Midrash Ha-Gadol*) xxxiii : 10, p. 215, the reading is : "Agrippas, the hegemon, asked R. Yoḥanan b. Zakkai." It seems that the reference then can only be to "Agrippa the general" (see following note).

God to be "jealous".[38] He was certainly no Jew,[39] and was probably a general serving in the army of King Agrippa[40] (I?!)[41] and, if so, he must have conversed with R. Gamliel the Elder.[42] He displayed an interest both in the essence of the Torah and the nature of the One and Only God, Who was nevertheless capable of jealousy.

III

Roman interest in Jews and Judaism, which had begun earlier, did not disappear with the Destruction. On the contrary, it still increased in intensity. In the period between that event and the Hadrianic persecutions proselytisation reached its peak. Seneca's jibe, *Victi victoribus leges dederunt*,[43] was more applicable to those, than to any other times. It is no wonder, then, that in certain Roman circles, interest in Judaism assumed such proportions that it sometimes bore official or semi-official character.[44] It seems that discussions about the granting of some partial official recognition to the status of R. Gamliel of Jabneh, or at all events to the judicial status of the

[38] Avodah Zarah 55a; Ms. Munich (see Rabinowicz, *Diqduqey Soferim*, Avodah Zarah, p. 118) reads: "Agrippa, the general of Agrippas (the same reading seems to have been before Rashi — *q.v.*, *s.v.* "Agrippas"). Cf. *Mekhilta de R. Simeon b. Yoḥai* (from *Midrash Ha-Gadol*), XX 5, p. 147: "Agrippas the Elder asked of R. Gamliel." According to one reading, this same Aggripa also asked R. Gamliel why God is jealous of idolaters rather than of idolatry itself (Avodah Zarah 54b, Ms. Vatican: "A certain Agrippa" [as against "a certain philosopher" in other manuscripts and the printed editions]). See S. Abramson, *Tractate Avodah Zarah*, Ms. Jewish Theological Seminary of New York (New York 1957), p. 209. Cf. however *Mekhilta de R. Ishmael*, Ba-Ḥodesh vi, p. 226: "philosophos" (In the *Mekhilta*, the two dialogues: (a) Avodah Zarah 55a, (b) *ibid.*, 54b, have been combined into one. See L. Wallach, "A Palestinian Polemic against Idolatry", *HUCA* XIX [1945–1946], pp. 389–404).

[39] So Rashi has already correctly noted, Avodah Zarah 55a, *s.v.* "Agrippas". Cf. L. Ginzberg, *Tosefet Arukh Ha-Shalem* (1936), *s.v.* "Agrippas", pp. 419–420 (as against E. E. Urbach's conjecture in his note on *Mekhilta de R. Simeon b. Yoḥai*, p. 147).

[40] See n. 38 above.

[41] There definitely were non-Jewish mercenaries in Agrippa's army — not as S. Klein has assumed in his "Zum jüdischen Heerwesen in der Mishnischen Zeit", *Jeschurun* (ed. Wohlgemuth), X (1923), p. 88. His view has already been refuted by V. Aptowitzer, *Parteipolitik der Hasmonäerzeit etc.* (1927), pp. 309 ff.

[42] Accordingly, the reference in *Sifre*, Deut. (see n. 37 above) is also to R. Gamliel the Elder, unless the reading of the *Midrash Ha-Gadol* is accepted *in toto* and we assume that the same conversation took place with R. Yoḥanan b. Zakkai. This is definitely possible since R. Yoḥanan b. Zakkai, who received the oral tradition from Hillel and Shammai, was already famous, apparently, during the time of Agrippa I.

[43] See Reinach, *op. cit.* (n. 7 above), p. 263.

[44] See, lately, M. Stern, "Philo-Judaism in Roman Senatorial Circles during the period of the Ancient Empire", *Zion* XXIX (1964), pp. 156 ff. (Hebrew).

Jewish law courts led to the visit of military officials at his Academy[45] in order to determine the nature of Jewish Law. Apparently they knew Aramaic and pretended to be Jewish students. After they had given their approval of Jewish jurisprudence as a whole, they only objected to those laws discriminating against gentiles, e.g. stealing from a gentile, the delivery and nursing of a gentile infant, and the case of an ox owned by a Jew goring another owned by a gentile. Subsequently, R. Gamliel enacted an ordinance prohibiting the retention of property stolen from a gentile, so as to prevent a desecration of the Name of God.[46] Another tradition, that the Imperial government had sent two army officers to locate Moses' grave[47] (according to one mediaeval source, the mission was dispatched by Hadrian[48]) is also not surprising. Moses occupied a prominent position in the interest of those gentiles who had dealings with Jews and Judaism as has been shown above.[49] Opinions among the non-Jews were divided on whether Moses was a villain or a saint, a deceiver or a sublime leader, a wizard, a necromancer or a prophet.

To this area, too, belong the conversations between R. Akiva and Tineius Rufus. In one of them, Rufus questioned the particular character of the Sabbath. He wondered why God Himself caused rain to fall and performed other acts on Saturdays.[50] In another debate with R. Akiva, while discussing the question whether human or Divine acts were superior, Rufus demanded to know why, if God had desired man to be circumcized, He did not create him so.[51] He further demanded to know why circumcision had not been mentioned in the Ten Commandments.[52] Rufus also asked

[45] *Sifre*, Deut. 344 (p. 401) [There, however, the reading is "to Usha", and in Ms. Berlin even: "R. Simeon b. Gamliel" instead of "R. Gamliel" (Cf. Urbach, in his study mentioned above, n. 11, p. 67). Nevertheless, these variants cannot be accepted, and are certainly not to be preferred to the versions in the parallel passages listed below. The matter has already been dealt with by G. Allon, *op. cit.* (n. 34 above), Vol. I, p. 292]; P.T. Bava Qamma IV 3 (4b); B.T. Bava Qamma 38a. — The historical background of the visit has been described by G. Allon, *op. cit.*, Vol. I, p. 72; S. Safrai, in his study referred to above (n. 28), p. 219. Also E.E. Urbach, who exercised much more caution in dealing with the episode (see his above mentioned article, pp. 66–67, and more recently his study, referred to above, n. 36, p. 56), agrees that there was an interest, although he did not arrive at any definite conclusion concerning its results.

R. Akiva why, if God loved the poor, did He not sustain them?[53] (In that very conversation, Rufus also contended that Jews were slaves, since they did not obey the will of God.) Rufus further asked why God hated the gentiles, and R. Akiva's reply contains a clear reference to the Imperial cult.[54] Now all these discussions centered on themes that were of topical and current interest and that occupied the attention of cultured Romans in the period when conversions to Judaism had reached their peak. Two precepts held the centre of these discussions — precepts that, in the eyes of the Romans, were most typical of Jews and proselytes (as well as *metuentes* —

[53] Bava Batra 10a.

[54] *Tanḥuma* Terumah 3. There, however, R. Akiva's reply reads: "You take wood". In his generation, however, it was already common knowledge "that idolatry was of no real substance" (Avodah Zarah 55a). Hence it appears that what R. Akiva had in mind was mainly the Imperial cult, which became very popular in his time. In his article (cited in n. 38 above), L. Wallach connected this dialogue with the discussion of the philosopher with R. Gamliel concerning idolatry (*Mekhilta de R. Ishmael*, Ba-Ḥodesh vi, p. 226; Avodah Zarah 54b–55a), during the course of which R. Gamliel used the parable of a person (or prince) who had raised a dog to which he gave his father's name. Whenever the person took an oath, or vow, he exclaimed: "By the life of the dog". According to Wallach, direct use was made here of the humorous fallacy appearing in Plato, Euthydaemos 298. As Wallach would have it (in his above-mentioned article, p, 391): "There is no doubt that he must have known Plato's dialogue directly" (sic!). "He", here, is not R. Gamliel but his archetype, since, according to Wallach, the original element of the two stories is a single archetype about a controversy between a Jew and an idolater. R. Akiva, too, told Tineius Rufus of his dream about two dogs, hence both incidents are nothing but variations upon a single theme (*ibid.*, pp. 397ff.). First came the archetype; then, several variations developed; finally various literary miscellanies about polemics against idolatry were compiled in one of which the participants were Gamliel and a philosopher, and in another R. Akiva and Tineius Rufus. Wallach even asserts that neither I. Ziegler (*Die Königsgleichnisse des Midrasch* [Breslau 1903], p. 315) nor S. Lieberman (*Greek in Jewish Palestine* [New York 1942], pp. 125–127) both of whom discussed the dog-parable of R. Gamliel, recognized its true significance (*ibid.*, p. 394, n. 12: "Lieberman did not recognize the Plato quotation" [sic!]; see further *ibid.*, n. 13). Wallach's arguments, however, are altogether unconvincing. The two parables used by R. Gamliel and R. Akiva are similar but in respect of the reference to a dog and to idolatry. Their detailed stories are totally different. At all events, not only does R. Akiva's remark differ radically from the logical fallacy mantioned in Plato, but R. Gamliel's parable, too, bears no real resemblance whatever to the statement of Dionysodorus. In *Euthydaemos* the argument runs thus: If you own a wicked dog which begets puppies, the dog, being a father and being yours is *your father* and you are a brother to the puppies (not a single word being said about the name of the dog, or the real father of the owner). R. Gamliel's figure on the other hand does not assert that the dog was father to the man, but that whoever named his dog after his father and swore by the name of the dog and thus uttered the father's name, infuriated the father. Lieberman correctly identified the Greek source for taking an oath by the name of a dog. Furthermore, there are no grounds whatever for Wallach's assumption of the existence of literary collections or of the direct use of a Platonic quotation. On the contrary, it is quite definite that rabbinic literature contains no quotations from Greek literary

the gentiles who feared the Lord), viz. circumcision and the Sabbath.[55] Now Rufus raised some doubts whether the observance of such precepts actually constituted obeying the true will of God. Charity, too, occupied an important part in religious, social and political ideas both among gentiles and Jews.[56] It is also obvious that, to the cosmopolitan frame of mind prevailing in Rome during the second century C.E., Jewish isolation from gentiles was considered a very grave matter. These discussions with R. Akiva, which demonstrate the interest of Roman statesmen and enlightened citizens in the religion and people of Israel, must obviously have been conducted while he still enjoyed his freedom, before the Bar Kokhba rebellion (there being no evidence whatever that they took place during R. Akiva's imprisonment).[57]

IV

Not all the discussions between Sages and Romans were held in Judaea and its vicinity. Some took place in Rome and Italy. Jewish Sages happened to be in Rome for a variety of reasons. Some were carried there as captives, some came there for personal visits or on business of the local Jewish community and some travelled to Rome for political purposes, i.e. to conduct political talks with the heads of State. Whatever brought them there, once they came they met with members of the government with whom they engaged in conversation. It does not fall within our purview to deal here extensively with the phenomenon of the visits of the sages of the provinces to Rome, a practice that had become common in the first centuries C.E. not only amongst Jews. Our attention will be devoted only to the conversations as such.

sources. Wallach was correct in this respect, however, that the philosopher's description of the fire that broke out in a certain land and burnt down everything except the idolatrous temple is a clear allusion to the destruction of the Temple and its religious significance. It is Wallach himself, however, who failed to discern the basic meaning of the entire dialogue between R. Gamliel and the philosopher. The remarks are not, as he would have us believe, directed " against Idolatry", but against the Imperial cult, as the climax of the discussion, "they even worship human beings" (Avodah Zarah 55a,; *Mekhilta*, Ba-Ḥodesh vi: "And even to man. . . if so, they even worship man"), clearly indicates. These words reveal the true tenor of the remarks, so characteristic of R. Gamliel's days, the period (after 96 C.E.) when the Imperial cult occupied so prominent a position in political and religious thinking in Rome and the Hellenistic world.

[55] See the works of Roman authors contemporaneous with R. Akiva: Tacitus, *Historiae* V 4–5; Martialis, *Epigramm.* IV 4,7; VII 30,5; VII 35; VII 55,7; VII 82; IX 94; Juvenal, *Satires* VI 159–160; XIV 96–106. As for later Hellenistic and Roman literature, cf. Reinach, *op. cit.* (n. 7), Index, *s.v.* "circoncision, sabbat".

[56] As E.E. Urbach has proved in his article: "Political and Social Tendencies in Talmudic Concepts of Charity", *Zion* XVI 3–4 (1951), pp. 1–27 (Hebrew).

[57] As was already noted by S. Lieberman in "The Martyrs of Caesaria", *Annuaire de l'Institut de philologie et d'histoire orientales et slaves* VII (1939–1944), p. 421, n. 29.

Both R. Ẓadoq, who was captured, apparently during the War of the Destruction and transported to Rome, and R. Akiva, who proceeded there on a mission (probably after 96 C.E.), were subjected to similar experiences, which aroused the astonishment of the gentiles. R. Ẓadoq was "a leading figure in his generation"; "when he was taken captive to Rome, a certain matron took him and sent a beautiful maidservant to him". R. Ẓadoq, however, "turned his eyes to the wall, so as not to behold her. All night long he sat studying". In the morning the maidservant went and complained to her mistress: "I would rather die than be given to this man". Upon being asked by the matron "Why did you not act with this woman as men generally do?", R. Ẓadoq replied: "What could I do: I am descended from the High Priesthood, from a distinguished family. I said: If I come to her I shall bring many bastards into Israel". After she had heard his words, the matron gave orders that he should be set free with great honours.[58] R. Akiva endured a similar ordeal. When he went to Rome, a certain prefect (hegemon) "sent two beautiful women to him. They were bathed, anointed and outfitted like brides". Each kept wooing him, but he sat between them and spat, and would not attend to them. In the morning, they said to the prefect: "We would rather die than be given to this man". R. Akiva was asked by the prefect: "Why did you not act with these women as men generally do with women? Are they not beautiful? Are they not human beings like you? Did not he who created you create them?" R. Akiva replied: "What should I do? Their odour overcame me, reeking of the meat of carrion and beasts torn by wild animals and creeping things".[59]

In both episodes the behaviour of the Sages and the reaction of the offered women were the same. Very similar, too, was the reaction of those who sent the women, in conformity with the view of universal, human brotherhood which had become strong in Rome after 96 C.E.[60] Such Roman views clashed with the Jewish tendency to separate themselves from gentiles in food and

[58] *Avot de R. Natan*, A, XVI; In B.T. Qiddushin 40a, R. Ẓadoq is the hero of another story in which a certain matron wished to seduce him, and he excused himself by saying that as he was too weak, he liked to eat first. When she offered him some forbidden food, he said: "What difference does it make? Whoever does that may eat this". When she heated the oven to cook the food, R. Ẓadoq seated himself in the oven, saying to the matron that whoever commits this transgression is punished with fire. Whereupon she answered that, had she known how grave such an act was, she would not have vexed him. This account in the Babylonian Talmud shows signs of late adaptation.

[59] *Avot de R. Natan*, A, XVI.

[60] Cf. my article, "Persecutions and Martyrology in Hadrian's Days", *Scripta Hierosolymitana* XXIII (in press).

marriage — as Tacitus put it: "*separati epulis, discreti cubilibus*",[61] or in the wording of the Midrash, "they do not take our daughters, nor do they give their daughters to us. . ."[62] It is quite easy to proceed from this standpoint to accusing the Jews of being misanthropists, haters of mankind.[63] Yet in contradistinction to the identical reactions of the women, and the similar reactions of the prefect and the matron, the excuses offered by the Sages differ radically from one another. R. Ẓadoq's excuse was his priestly descent. R. Akiva, on the other hand, defended his action by advancing a halakhic prohibiton. Scholars have experienced much difficulty in explaining R. Ẓadoq's reply. Is a gentile woman, then, permissible to a non-priest, an ordinary Jew?[64] However, there is no real difficulty. The differences in the answers are easily accounted for by the difference in their respective situations. R. Akiva had arrived in Rome as a free man on an official mission. The prefect wanted to treat him to beautiful, free women. R. Ẓadoq, by contrast, was a captive, a slave. Hence his mistress wanted to mate him a slave-woman with whom to beget slave children. R. Ẓadoq could hardly have disclosed the true reason for his conduct — a slave, after all, is subservient to the will of his master. He therefore accounted for his refusal to consort with the slave-woman by his ancient and noble descent.[65] Indeed, his tactics were eminently successful. Such was the spirit of the time that his reply struck a responsive chord in the heart of the matron, who thereupon liberated him "with great honours." R. Akiva's reply, however, only evoked even greater astonishment than before.

R. Akiva was not the only one to travel to Rome on a political mission. His friends and contemporaries also engaged in such undertakings, some-

[61] *Historiae* V 5.

[62] *Abba Gorion* 3 (ed. Buber, p. 31). Cf. also the other sources enumerated in my article referred to above (n. 27), pp. 151, notes 12–13.

[63] See my same articel, p. 156. Philostratus' striking formulation in his *Apolonius of Tyana* V, 33, should be compared as well.

[64] Cf. I. Heinemann, "Judaism in the Eyes of the Ancient World" *Zion* IV (1939), p. 284, n. 55 (Hebrew) (which contains reference to previous literature on the subject).

[65] This can easily be explained psychologically. The episode involving the son and daughter of R. Ishmael b. Elisha, who were taken into captivity and sold to two masters, is similar. The master sought to mate the two to produce offspring which the owners would share between them. "They put them into a room. The one sat in his corner, and the other sat in her corner. He said: Shall I, a priest, a son of High Priests, marry a slave-woman? And she said: Shall I, a priestess, a daughter of High Priests, be married to a slave?!" (Gittin 58a). The same is true of the parallel incident involving the son and daughter of R. Ẓadoq, the Priest, who were taken captive and confined in the same house. The daughter wept and said: "Woe to this daughter of the High Priest to go and be married to a slave" (*Lam. Rabba* i:16).

times going alone but mostly in a group.[66] Two sources relate the experiences of R. Gamliel and R. Eliezer (b. Hyrcanos) and R. Joshua (b. Ḥananiah) who stayed in Rome together.[67] Other sources tell only of R. Eliezer's and R. Joshua's staying in Rome,[68] or else of R. Joshua's and R. Gamliel's.[69] On the other hand, there are several accounts of a journey undertaken by four Sages: R. Gamliel, R. Joshua, R. Eleazar b. Azariah and R. Akiva.[70] Again, some sources relate the staying in Rome or the travel by boat of one of these Sages alone,[71] or of two of them together.[72] (Yet, not a single extant source gives any information of R. Eliezer b. Hyrcanos embarking on such a voyage together with R. Eleazar b. Azariah or together with R. Akiva).[73]

[66] Clearly Rome is not always the destination whenever a voyage of the Sages across the sea is mentioned; nor were they engaged in political missions each and every time they did journey to that city. Generally, however, in the days of R. Gamliel of Jabneh, the journeys to Rome and Italy were apparently of this nature, even though they served other incidental purposes as well, such as maintaining contact with diaspora Jewry and ransoming captives (cf. G. Allon, *op. cit.*, [n. 34 above], Vol. I, pp. 148, 354).

[67] P.T. Sanhedrin 7,19 (25d); *Deut. Rabba* II 24. Allon's view denying all authenticity to these traditions (*op. cit.* [n. 34 above], Vol. I, p. 77) has no foundation whatever.

[68] *Gen. Rabba* xiii:9 (p. 118) = *Eccl. Rabba* i:7; *Eccl. Rabba* xi:1. Cf. also Bava Batra 74b on the voyage of R. Eliezer and R. Joshua by boat.

[69] *Gen. Rabba* xx:4 (pp. 185–186) — also by the title, "The Elders in Rome" (Cf. also Mishnah Avodah Zarah 4.7 = Tosefta Avodah Zarah 6 [7].7 = B.T. Avodah Zarah 54b; cf., however, regarding this title, *Gen. Rabba* x:9, p. 85 and see n. 70 below). Cf. also Horayot 10a on R. Gamliel and R. Joshua on a boat.

[70] Mishnah Eruvin 4.1–2; *Sifre*, Deut. 43 (pp. 94–95) = *ibid.*, 318 (p. 361) = *Lam. Rabba* v:18 = B.T. Makkot 24a–b; *Exod. Rabba* xxx:9 = L. Ginzberg, *Genizah Studies in Memory of Dr. Schechter*, Vol. I, p. 219; *Midrash Agur*, also called *Mishnat R. Eliezer*, ed. Enelow, p. 103; *Derekh Ereẓ* Pirqey b. Azzai, 3,2 (pp. 183 ff.) — also by the appellation "Four Elders". — "R. Gamliel and the Elders", including R. Akiva, as reclining together in Rome, are mentioned in the Tosefta Yom Tov 2.12 (p. 289). Cf., on these four Sages on a boat, Mishnah Ma'aser Sheni V 9, here too with the designation, "R. Gamliel and the Elders"; *Sifra*, Emor Chapter XVI 2 (here too described similarly) = B.T. Sukkah 41b = Tosefta Sukkah 2.11 (p. 265) [here only the above mentioned general designation, without any specific naming of individuals, appears]; cf. further Tosefta Shabbat 13 (14).14 (p. 62) and Mishnah Sahbbat 16.8 on "Rabban Gamliel and the Elders" on a boat; *Midrash Tanna'im* (from *Midrash Ha-Gadol*) XXVI 3 (p. 172) on R. Gamliel and his disciples on a boat.

[71] R. Gamliel alone on a boat — Bava Meẓi'a 59b; R. Joshua in Rome — Tosefta Horayot 2.5–6 (Ms. Vienna and printed editions) = P.T. Horayot 3.7 (48b) = B.T. Gittin 58a; R. Eleazar b. Azariah in Rome — Yoma 86a (the parallel passages, however, make no mention of Rome, yet cf., too, Berakhot 27b); R. Akiva in Rome — *Avot de R. Natan*, A, XVI; *Ruth Rabba* vi:1; *Eccl. Rabba* x:7; cf. also Avodah Zarah 10b.

[72] P.T. Sukkah 2.4 (52d) [R. Eleazar b. Azariah and R. Akiva on board] = B.T. Sukkah 23a (R. Gamliel and R. Akiva on board). On R. Gamliel and R. Joshua see the sources mentioned in n. 69 above.

[73] R. Akiva is mentioned as going together with R. Eliezer and R. Joshua to the Sands

Here we shall make no attempt to discuss the total number of such journeys — a question which has been dealt with extensively by many scholars. We shall merely content ourselves with the assertion that the total cannot by any count be reduced to one, or even two. Inter alia, we have the evidence of the special halakhic dispensations granted to the house of R. Gamliel, as against the rest of the Jewish people, "because they maintain close relations with the government"[74] ("government" here denotes not merely the officialdom in Judaea or even the legate of Syria[75] exclusively[76]).

Such trips, normally for political purposes, were by no means unusual. It has been stated above that statesmen and sages of the various provinces, especially from Greece, Asia Minor and the Orient, used to flock to Rome during the first centuries of the Christian Era. Let it suffice to mention here Apollonius of Tyana and Aelius Aristides by way of example. Like them, the Jewish Sages, too, were able, while visiting Rome, to engage in discussion not only with Emperors (in R. Gamliel's time the reference would mainly be to Trajan, or Hadrian in the early years of his reign) and the members of their families. They also spoke with other government officials as well as with philosophers and sages and common people. Obviously it cannot always be determined with any accuracy whether a particular conversation occurred in Rome or in Erez Israel.[76*] What we can, and ought to do, however, is to direct our attention to the topics of the talks.

Among the participants, the *metuentes* and semi-proselytes occupy a position of special importance. A certain *metuens*, an outstanding statesman, apparently a Roman senator, who had happened to meet R. Gamliel, R. Eliezer and R. Joshua helped the Sages and gave away his life in order to save the Jewish people. Only after his death did it become known that he had even been circumcised.[77] A similar incident is related of Keti'a bar

of Antioch when they travelled abroad to obtain support for needy scholars—P. T. Horayot 3.7 (48a) = *Levit. Rabba* v:4 (pp. 110ff.) = *Deut. Rabba* iv:8.

[74] Tosefta Avodah Zarah 3.5.

[75] See Mishnah Eduyot 7.7.

[76] Cf. Berakhot 27b, on R. Eleazar b. Azariah.

[76*] Nevertheless, there are no grounds for Bacher's view, *op. cit.* (n. 26 above), Vol. I, p. 179 that all the dialogues between R. Joshua and Hadrian took place in Palestine or Alexandria only.

[77] *Deut. Rabba* ii:24. This is not the place to deal with the problem of the identity of the historical personality constituting the hero of the episode, and whether there is any connection between this incident and the affair of Flavius Clemens, Domitian's relative (cf. G. Allon, *op. cit.* [n. 34 above], pp. 74–77). The actual existence of such *metuentes*, who often even had themselves circumcised and fully converted to Judaism, is well known both from the remarks of Juvenal and Martialis as well as from the work of contemporaneous historians (especially Suetonius and Tacitus).

Shalom. He also gave away his life to save the Jewish people. Before he was executed, he circumcised himself and bequeathed his possessions to R. Akiva and his associates. The account mentions a certain matron as having encouraged him to circumcise himself before his death.[78] It is well known that there were many women (matrons) among the *metuentes* and proselytes. In their conversations with the Jewish Sages, these women displayed an especially keen interest in the doctrine of reward and punishment. To this group belongs the anonymous matron who asked R. Eliezer whether the single act of worshipping the golden calf justified the threefold punishment meted out in retribution,[79] as well as Veluria, the proselyte, who questioned R. Gamliel on the contradiction between the verses speaking of God's expressed favouritism on the one hand and His impartiality on the other.[80] Another matron inquired of R. Joshua b. Ḥananiah how God could have undertaken to commit robbery, as he had extracted one of Adam's ribs to create Eve.[81] At times, such comments implied personal attacks and also allusions to the miserable state of the Jews. A jibe of this kind was hurled at R. Akiva by a certain eunuch, "an important member of the government".[82] Generally, however, the questions were aimed at eliciting objective information. Philosophers inquired of the "elders in Rome" concerning the attitude of the Holy One, blessed be He, to idolatry.[83] "Romans" requested from R. Joshua Scriptural references "attesting that God would resurrect the dead and had knowledge of future events".[84] These two problems containing the wonder about Divine omnipresence, omniscience and omnipotence, especially engaged the attention of non-Jews. Similarly, a certain prefect asked R. Gamliel where "the Holi[ness]" was located.[84*] The four elders, R. Eliezer, R. Joshua, R. Eleazar b. Azariah and R. Akiva, came to Rome and preached there. A "heretic" taunted them with the question why God Himself failed to observe the Sabbath (a characteristic question which has

[78] Avodah Zarah 10b. On another, similar hero, Ben Kufia, see *Midrash Tehillim* 9.13. Cf. also the story about the philosopher, the friend of the four Sages, who went to the "inner Kingdom" (*Derekh Ereẓ*, Pirqey b. Azzai, 3.2, pp. 183ff.).

[79] P.T. Sotah 3.4, (19a); cf. B.T. Yoma 66b, "A certain woman. . ." (this is the correct reading, in Ms. Oxford and Ms. London, and not "a wise woman". See Rabbinowitz, *Diqduqey Soferim*, Yoma, p. 186).

[80] Rosh Ha-shanah 17b.; cf. Pesiqta Ḥadeta (Jellinek, *Bet Hamidrash*, Vol. VI, p. 61).

[81] *Avot de R. Natan*, B, VIII.

[82] *Eccl. Rabba* x:7 (but cf. also Shabbat 152a).

[83] Mishnah Avodah Zarah 4.7 = Tosefta Avodah Zarah, 6 (7).7 = B.T. Avodah Zarah 54b. This dialogue forms part of a longer discussion between R. Gamliel and a certain philosopher, referred to in n. 54 above.

[84] Sanhedrin 90b.

[84*] L. Ginzberg, *Genizah Studies in Memory of Dr. Schechter*, Vol. I, pp. 222–223.

already been mentioned above).[85] A philosopher addressed a question on the duration of the gestation of the snake to R. Gamliel and R. Joshua.[86]

The most interesting of all these confrontations were the debates between the Emperor and the Jewish Sages. *The* Emperor is, as has been stated above, Trajan or Hadrian (at the beginning of his reign).[87] In the discussions with R. Gamliel, the Emperor raised the problems of the creation of Eve from Adam's body ("your God is a thief"),[88] God's exact place and His acts, His omniscience and His unity,[89] as well as the problem of the physical resurrection of the dead.[90] To these are to be added two more questions that "the wicked Roman government"[90*] asked R. Gamliel — whether "upper or lower face is prettier" and whether there is a master of the universe. All these topics were again typical of their times. Most of them occur also in other contemporaneous conversations, and are all characteristic of the philosophical criticism of Jewish religion and its God. Here there is an attempt to cast doubts on God's ethics, and morals, as well as on His omnipotence, omniscience and omnipresence. There is also doubt of His providential power, and, finally, Scripture itself was cited as allegedly lending support to a dualistic conception. Undoubtedly the Emperor, whoever he might have been, was hardly sufficiently familiar with Scripture to quote passages in support of his arguments. He might even have had no direct knowledge at all

[85] *Exod. Rabba* xxx:9 = L. Ginzberg, *op. cit.* Vol. I, pp. 219–220. A similar question was put to R. Akiva by Tineius Rufus; cf. the sources mentioned above in n. 50.

[86] *Gen. Rabba* xx:4 (pp. 185–186); cf. n. 105 below.

[87] It is difficult to conceive that Domitian should have manifested such an interest in the Jewish Torah on his own. On the other hand, our sources, mainly the non-Jewish ones, note the benevolent attitude towards Jews on the part of Trajan, his wife Plotina, and Hadrian at the beginning of his reign. It should not be forgotten, in this connection, that Hadrian had made it his favorite hobby to engage in conversation with individuals of all types and descriptions. See the source mentioned in n. 3 above; cf., too, *Historia Augusta*, Vita Hadriani XX 2: "Apud Alexandriam in Museo multas quaestiones professoribus proposuit et propositas ipse dissolvit"; *ibid.*, XVI 8: "Licet eos quaestionibus semper agitaverit"; *ibid.*, XX 7: "Fuit memoriae ingentis . . . ad omnia respondit"; cf. *ibid.* XX 11.

[88] Cf. on this question, the conversation between the matron and R. Joshua in the source mentioned above (n. 81).

[89] All five discussions (two of them on the unity of God) are found in Sanhedrin 39a (see Rabbinowitz, *Diqduqey Soferim*, Sanhedrin, pp. 108–109). On the question of where God is located, cf. the source cited in n. 84* above.

[90] Sanhedrin 90b–91a (See Rabbinowitz, *Diqduqey Soferim*, Sanhedrin, p. 250). On this problem and on Divine omniscience, cf. the source mentioned above in n. 84 (the conversation between the Romans and R. Joshua).

[90*] L. Ginzberg, *Ha-Goren* IX (1923), pp. 62–64.

of the Bible (and this view seems almost certainly to be the correct one).[91] Nevertheless, he could have obtained some knowledge of certain biblical topics at second or third hand. It is interesting, too, that the Emperor's own daughter supplied the answers to her father's questions on two occasions.[91*] This fact furnishes striking evidence of the extent to which Jewish ideas had penetrated even within the royal family. That both Trajan and Hadrian were childless is of no consequence. The "daughter of the Emperor" could very well have designated his niece or the like.

Even more enlightening information emerges from Hadrian's (or merely the Emperor's) conversations with R. Joshua b. Ḥananiah. Here is an enumeration of the topics covered in these discussions:

(a) God's essence (the Emperor requesting to see Him, and expressing his desire to arrange a banquet in God's honour).[92]

(b) The Deity and the realm of the angels.[93]

(c) Divine justice (the question why some people are born cripples).[94]

(d) God as Creator and *creatio ex nihilo*;[95] the nature of the world.[96]

(e) With which bodily organ the resurrection of the dead would begin.[97]

(f) The permanent validity of the Law of Moses (the Sabbath).[98]

[91] True, it is said of Hadrian that "libros statim lectos et ignotos quidem plurim memoriter redidit" (*Historia Augusta*, Vita Hadriani XX 11), but that does not affect this case at all.

[91*] So it seems to us following Rashi, Sanhedrin 91a, *s. v.* "*amera*", not like the scholars who explain: the daugther of R. Gamliel.

[92] Ḥullin 59b–60a (the demand to see God occurs twice): *Midrash Avkir*, Devir I (1923), pp. 123–125. For a somewhat similar topic in the conversations of R. Gamliel with the Emperor and a hegemon, see the sources cited above in notes 84*, 89.

[93] *Gen. Rabba* LXXVIII:1 (pp. 916–917) = *Lam. Rabba* iii:23.

[94] *Seder Eliyahu Zuta* 23 (= Pirqey de R. Eliezer 5) [Supplements to *Seder Eliyahu Zuta*, pp. 41–42]—so the Ms. (in the printed editions, it is R. Joshua b. Qorḥa who debates with the Emperor); cf. also the stories in Jellinek, *Bet Hamidrash*, V, p. 132.

[95] *Gen. Rabba* x:3 (pp. 75–76); Ḥullin 60a — another conversation on a similar theme between the "Emperor's daughter" and R. Joshua.

[96] *Gen. Rabba* xiii:9 (p. 118) = *Eccl. Rabba* i:7 (Hadrian with R. Eliezer and R. Joshua); cf. also the dialogue between Aqilas and Hadrian on the existence of the world — P.T. Ḥagigah 2.1 (77a); *Tanḥuma Bereshit* 5; *Tanḥuma* Ms. Cambridge in E.E. Urbach, "Seridey Tanḥuma Yelamedenu", *Kovetz 'Al Yad* NS VI (XVI) [1961], p. 21. In Midrash Temurah, Wertheimer, *Batey Midrashot*, Vol. II, pp. 193–194 — "Royalty" posed a similar question to R. Akiva. On Hadrian's interest in the seas, and in the relation between water and God, see also *Midrash Tehillim*, 93.6; cf. L. Ginzberg, *Legends of the Jews*, Vol. V, p. 18.

[97] *Gen. Rab ba*xxviii:3 (pp. 261–262) = *Lev. Rabba* xviii:1 (p. 394) = *Eccl. Rabba* xii:5.

[98] *Ruth Rabba* iii:2 = *Eccl. Rabba* ix:4 = *Eccl. Zuta* ix:4 (here the obedience to the precepts of the Torah is contrasted with the obedience to Hadrian's decrees — to the advantage of the former).

(g) The enjoyment of the Sabbath (the odour of the Sabbath dishes).[99]

(h) The election of Israel. "The Emperor Hadrian remarked to R. Joshua: Great is the lamb that can survive amongst seventy wolves. He replied: Great is the Shepherd who rescues it and scatters them before it".[100]

(i) The relation between the commandments given to all peoples and thoses reserved for Israel alone (the last five, as compared with the first five, of the Ten Commandments).[101]

(j) The praise of the Land of Israel (in respect of its agriculture).[102]

(k) Did not the disappearance of the royal house of David and the cessation of the Temple service constitute a breaking of the Divine promises?[103]

(l) Relation between Rome and Parthia.[104]

(m) The duration of the gestation of the snake.[105]

In addition, an account has also been preserved of a verbal exchange between the Emperor's daughter and R. Joshua b. Ḥananiah on his being a great scholar and yet physically ugly ("The glorious Torah in a repulsive vessel").[106] Here, too, an examination of the sources yields the information that the choice of subject was by no means an accident. The discussions possess a special importance, since through them is displayed Hadrian's (or the Emperor's)[106*] interest in the Jewish people, their Torah and their God. And here again the problem of conceiving God as utterly incorporeal reappears — a conception that shocked the entire ancient world.[107]

[99] Shabbat 119a (in a Midrash to Genesis, published by L. Ginzberg, *op. cit.* (n. 70 above), Vol. I, pp. 2–3, the same story is told of Agrippa and his slave). A similar motif, regarding the study of the Torah, appears in a talk between Hadrian and Aqilas — Exod. Rabba xxx:12.

[100] *Esther Rabba* x:11 = *Tanḥuma* Toledot 5 (Cf. also *Midrash Tehillim* 12.1: "Hadrian, may his bones rot, asked: By what merit has this people survived?"). A similar topic occurred between a *min* (heretic) and R. Joshua in the presence of the Emperor, see Ḥagigah 5b; cf. also the source cited in n. 2 above.

[101] *Pesiqta Rabbati* 21 (99a).

[102] *Eccl. Rabba* ii:8.

[103] L. Ginzberg, *op. cit.* (n. 70 above), Vol. I, p. 220 = *Yalqut Ha-Makhiri*, Malachi (ed. Grünhut), p. 17.

[104] Berakhot 56a (the Emperor's nightmare of a defeat by the Persians).

[105] Bekhorot 8b. The identical question was put to R. Gamliel and R. Joshua by a certain philosopher, according to the source cited in n. 86 above.

[106] Ta'anit 7a/b = Nedarim 50b.

[106*] In B.T. and Seder Eliyahu Zuta: "Caesar" (i.e. Emperor); the other sources always explicitly mention: "Hadrian".

[107] Cf., for instance, Tacitus, *Historiae* V 5: "Iudaei mente sola unumque numen intelligunt; profanos, que deum imagines mortalibus materiis in species hominum effingant; summum illud et aeternum neque imitabile." On the demand to see God, see also L. Ginzberg, *Legends of the Jews*, Vol. V, p. 338; there he has listed all the previous literature on the subject.

Similarly the doctrine of reward and punishment, which preoccupied the attention of those who were at all interested in Judaism, was also widely discussed. Doubts on the possibility of *creatio ex nihilo* and of the resurrection of the dead are also understandable, since such concepts were totally alien to the Greek and Roman mind. It has already previously been stated that the Law of Moses, and especially the Sabbath injunctions, much engaged the thinking of that age. Even more were the Romans struck with astonishment by the fact that the laws promulgated by the Emperor ("cosmocrator") were less punciliously obeyed than the commandments of the Torah (the law of a conquered and subjugated people!). The election of Israel and all the problems and implications — theoretical and practical — entailed in this doctrine, puzzled the Romans, especially in the light of the destruction of the Temple. In this respect, the talks between the Emperor and R. Joshua and the dialogue between Israel and the gentile nations, as postulated by R. Akiva,[108] had no doubt the same background. Finally the terrifying nightmare of a possible Roman defeat at the hands of the Parthians constantly confronted the Romans, especially in the period between Nero and Hadrian.[109] Clearly, there are among the discussions some legendary elements which are not peculiar to Jews alone.[110] Yet there are some which especially befit the personality of Hadrian.[111]

[108] *Mekhilta de R. Ishmael*, Shirah iii, p. 127; cf. what we have written on this in "Persecutions and Martylogy in Hadrian's Days", *Scripta Hierosolymitana* (xxiii; in press), See also Pirqey de Rabbenu Haqadosh, ed. S. Schonblum (*Shelosha Sefarim Niftaḥim* [Lemberg] 1877, 25b–26a), Bava de Arba'a 47. Hadrian confided to his closest associates that the Romans ought to have adopted four Jewish customs (i) Worship of God, (ii) Observance of the Sabbath, (iii) Circumcision and (iv) that Women cover their faces.

[109] See A. Shalit, "The Eastern Policy of the Romans — from Nero to Trajan", *Tarbiz* VII (1936), pp. 159–180 (Hebrew). As for the nightmare of a possible defeat of Rome by Persia, this has been dealt with by J. Gutman in his enlightening article "The Jewish war in the Time of Trajan", in *Sefer Asaf* (Jerusalem, 1953), pp. 149–184 (Hebrew). However, his conclusion, that the Emperor mentioned in the Talmud as having had the dream was Trajan and no one else (*ibid.*, p. 175), need not necessarily be accepted. The defeat of Trajan combined with other disasters in the distant past (the fate of Crassus, for instance) and terrifying visions of future events could quite easily have arisen in Hadrian's imagination. It makes no difference to our study whether the Emperor in question was Trajan or Hadrian. It should, however, be noted, that we have no record of any conversation in which Trajan's name is explicitly mentioned.

[110] Perhaps, the discussion on the ocean and, it need hardly be said, on the duration of the gestation of the snake, especially as elaborated and developed in relationship to the Sages of Athens (Bekhorot 8b–9a).

[111] Cf. also the allusion to the close relationship between R. Joshua and the Emperor, Shabbat 152a. See the account of the incident that occurred in the vicinity of Tiberias involving a certain old man and Hadrian (*Lev. Rabba* xxv:5, pp. 576–579 and the parallel passages [enumerated by Margulies, p. 576]). It has a general folk motif. But the argument of

V

Discussions between Sages and Romans did not cease even after the crushing of the Bar Kokhba rebellion. Conversations between the Sages who were apprehended for their participation in the rebellion or because they flouted the decrees of religious persecution and various Roman officials, constitute a separate distinct chapter.[112] After the end of the persecution, however, life once more resumed its normal course. According to one tradition, revocation of the decrees of persecution was obtained through the advice of a Roman matron, whose home was constantly visited by all Roman leaders. She advised R. Judah b. Shammu'a and his friends to organize a nocturnal demonstration.[113]

In the next generation, too, the visits to Rome continued unabated (e.g. the journey of R. Simeon b. Yoḥai).[114] Jews established close ties with Romans, and engaged in discussions with them. At first, however, one becomes conscious of a slight change in tone. Instead of the respect previously shown, the attitude of the Romans turned into one of contempt. So a certain prefect, for instance, exclaimed to R. Meir "You are a despicable people".[115] Personal taunting became more pronounced. A matron jeered at R. Judah b. 'Ilai that he was drunk, or else a usurer, or a pigbreeder.[116] Another matron poked fun at R. Eleazar b. Simeon's and R. Ishmael b. Yose's corpulence and at the behaviour of their wives.[117] Yet a more objective approach is also in evidence. R. Meir emerged the victor in his debates with Roman rulers,[118] and the conversations between a Roman matron and R. Yose b. Ḥalafta are marked by a highly serious interest.

Hadrian's servant is quite characteristic: "All this honour will accrue to this Jewish old man" (*ibid.*, p. 578) — a striking reminder of the observation in *Historia Augusta* XX 1, mentioned previously, in note 3.

[112] The conversations between Tineius Rufus and R. Akiva at the time the latter was questioned and tortured belong here (P.T. Berakhot 9.7 [14b] = P.T. Sotah 5.7 [20c]).

[113] Ta'anit 18a (ed. Malter [New York, 1930], p. 67) = Rosh Hashanah 19a = Scholion to Megillat Ta'anit, 28 Adar (ed. Lichtenstein, *HUCA* VIII–IX [1931–1932], p. 350). Cf. my remarks in my article (cited above [in n. 108]).

[114] See, for example, *Sifre Zuta* 8.2 (p. 255); Yoma 53b; *et al.* R. Eleazar B. R. Jose visited Rome too — Tosefta Kippurim 2(3). 16; Tosefta Niddah 7.1; *et al.*

[115] *Midrash Panim Aḥerim* (on Esther), Version B (ed. Buber, p. 81).

[116] P.T. Shabbat 8.1 (11a) = P.T. Pesaḥim 10.1 (37c) = B.T. Berakhot 55a; cf. Nedarim 49b = *Eccl. Rabba* viii:1.

[117] Bava Meẓi'a 84a.

[118] *Eccl. Rabba* i:9. Yet this account undoubtedly contains a lot of legendary embellishment, and even more so does the incident involving R. Eleazar b. Shammu'a, who aided the survivor of a sunken ship, the latter subsequently becoming Emperor; this account (*Eccl. Rabba* xi:1) also shows signs of later additions.

Her questions revolved round the following topics:

(a) The Jewish God as compared with the snake-god.[119]
(b) The creation.[120]
(c) Providence[121] and Divine justice.[122]
(d) The creation of woman (Eve) by robbing Adam.[123]
(e) Has Enoch never died?[124]
(f) Why did Esau emerge first?[125]
(g) The election of Israel.[126]
(h) Circumcision.[127]
(i) The histories of Jacob and Joseph.[128]

[119] *Exod. Rabba* iii:12. It is not precisely clear who the god of the matron was. The snake symbolised a variety of deities. See, e.g., W.C. Guthrie, *The Greeks and their Gods*, Index, *s.v.* "Snake"; J. Harrison, *Prolegomena to the Study of the Greek Religion*, Index, *s.v.* "Snake"; G. Murray, *Five Stages of the Greek Religion* (New York 1955), pp. 17–18.

[120] *Tanḥuma*, ed. Buber, *Bereishit* 2.

[121] *Gen. Rabba* lxviii:4 (pp. 771–773) = *Lev. Rabba* viii:1 (pp. 164–167) = *Pesiqta de R. Kahana* 2 (Ki Tissa). 4 (pp. 18–19) = *Midrash Samuel* 5.13 = *Tanḥuma*, ed. Buber, Be-midbar 18 = *ibid.*, Mattot 9 = *Tanḥuma* Be-midbar 16 = *Tanḥuma* Mattot 6 = *Num. Rabba* iii:6 = *Num. Rabba* xxii:8 = *Tanḥuma* Vayishlaḥ 10 = *Tanḥuma* ki Tissa 5.

[122] *Gen. Rabba* iv:6 (p. 30) [discrimination against certain Days of Creation]; *Pesiqta Rabbati* 22 (110b) [discrimination against certain letters of the alphabet]; *Eccl. Rabba* i:7 = *Eccl. Zuta* i:7 = *Tanḥuma*, ed. Buber, Miqqetz 9 = *Tanḥuma* Vayaqhel 2 (the uneven distribution of wisdom); *Num. Rabba* iii:2 = *Midrash Samuel* 8.2 (favouritism towards certain of the tribes); *Eccl. Rabba* iii:21 (reward and punishment in the world to come); *Lev. Rabba* xxviii:6 (p. 662) = *Pesiqta de R. Kahana* 8.3 (p. 143) = *Pesiqta Rabbati* 18 (93a) [the suffering of Ezekiel as compared with his servants.]

[123] *Gen. Rabba* xvii:7 (p. 158) [See the sources mentioned above in notes 81, 89, for similar questions addressed to R. Joshua and R. Gamliel. R. Yose's answers more closely resemble those of R. Joshua.]

[124] *Gen. Rabba* xxv:1 (p. 239).

[125] *Gen. Rabba* lxiii:8 (p. 688).

[126] *Tanḥuma*, ed. Buber, Bereishit 20; *Midrash Tanna'im* (from *Midrash Ha-Gadol*) XXVI 19 (p. 262).

[127] *Pesiqta Rabbati* 23 (117a). On a similar question addressed to R. Akiva by Tineius Rufus, see the source cited in n. 52 above. A similar question was addressed by Aqilas, the proselyte, to R. Eliezer (*Pesiqta Rabbati*, *ibid.*, 11b–117a), as well as by King Agrippa to R. Eliezer (*Tanḥuma*, Lekh-lekha 20; *Aggadat Bereshit*, 17). [The reference here is obviously to Agrippa II]. Hence it is evident that this question also troubled Jews. Interestingly, however, R. Yose's answer to the Roman matron is altogether different from the answers given in all other instances. Possibly, he wished to indicate thereby that a Jewish-Christian who observed the Sabbath, and yet remained uncircumcised, was acting improperly.

[128] *Gen. Rabba* lxxxiv:21 (p. 1027) [Why was Judah comforted after the deaths of members of his family, while Jacob could not be comforted for the death of Joseph?]; *ibid.*, lxxxvii:6 (pp. 1070–1071). [Is it possible that Joseph really suppressed his desire for Potiphar's wife?]

Certainly, all these conversations could hardly have occurred within a single, short span of time. In one — the discussion of the snake-god — the matron adopted a conspicuously idolatrous standpoint. In others, a genuine interest is manifested in the Torah of the Jews, as well as in the Jewish people and God, yet Christian and Gnostic overtones are partially discernible as well. Dualistic, Gnostic influence could have evoked the questions on the gradual creation of the world over a period of six days, the relation between the election of Israel and the existence of the world, and also the various questions about the persisting discrimination, as it were, in God's creation. Even the doubting of the Biblical descriptions of the personalities of Jacob and Joseph are characteristic of "Bible criticism" of the Gnostic genre. Apparently, Esau's prior emergence also belongs in this category.[128*] Christian influence, however, is quite transparent in the question relating to Enoch,[129] since his never having died, as it were, furnished a prototype for Jesus. The same may be true of the question about circumcision (and this explains the specific answer given by R. Yose to the matron).[130] Nor is the Skeptic-Epicurean attitude altogether absent. This accounts for the matron's query: "And with what has He been occupying Himself since that hour?"[131] — i.e. what is the function of God in the world after the conclusion of the six days of creation? There can be no doubt that this question conveys disbelief in Divine providence and God's intervention in the conduct of the world, a typical Epicurean concept.

What is to be elicited from all these questions? Apparently, we have here a matron whose religious problems and doubts are characteristic of the second century C.E., the epoch, when, what Gilbert Murray has termed "the Failure of Nerve", reached its climax. This was the period when the world was pervaded by "superstition and foolish terror",[132] and when men

[128*] It is doubtful whether Esau here is a cognomen for Rome. The question requires further study.

[129] On the significance accorded to Enoch's personality since the emergence of Christianity, see L. Ginzberg, *Legends*, Vol. V, pp. 156–157; cf. E.E. Urbach, *Encyclopaedia Ivrit*, Vol. XVII, *s.v.* "*Ḥanokh*", pp. 694–695. Certain specific aspects of the problem are dealt with, *inter alia*, by V. Aptowitzer, *Kain und Abel in der Agada* (Vienna 1922); L. Jung, *Fallen Angels in Jewish, Christian and Mohammedan Literature* (Philadelphia 1926). The whole topic, however, still awaits a basic and comprehensive study.

[130] See n. 127 above.

[131] In the sources listed in n. 121 above.

[132] Gilbert Murray, *op. cit.* (n. 119 above), p. 162. A most enlightening description of the religious situation in the Roman Empire during the middle of the second century C.E. is provided by the last chapter of F. Cumont's *Les religions orientales dans le paganisme romain*[2] (1909). Cf. also the fourth part of S. Dill's *Roman Society from Nero to Marcus Aurelius*, and the chapter on oriental religions in J. Carcopino, *La vie quotidienne à Rome* (1939).

were at the mercy of diverse currents and winds streaming and blowing from all directions. It is not within the scope of our study to determine whether R. Yose's "matron" was always the same person. Nor is it important to discover whether such a woman really existed. For, even, if she were but the result of creative fiction, she would still be an authentic reflection of what was occurring in actuality. Nurtured apparently on Hellenistic and Roman paganism, this matron manifested doubt in her faith and went about seeking a new faith. Her searching steered her towards both philosophy (mainly Epicurean) and the oriental religions, including Gnosticism and Christianity, and even Judaism. Since it is difficult to arrange these discussions in chronological order, we cannot discover what fate finally overtook her. But in the light of the comparatively large number of these talks it might be possible to draw some lines of her spiritual image. Her interest in Judaism was certainly at first inspired by second or third-hand information. It is highly doubtful whether she ever studied Hebrew, or had read the Bible or even the Pentateuch by itself — even in one of the Greek translations (LXX, Aqilas).[133] She was familiar with the Bible narratives and their heroes, apparently, from the sermons preached in study houses and synagogues, and from discussions with Jews (as well as with Christians and Gnostics). At all events, in a certain period of her life, apparently, she was on the verge of converting to Judaism. It is told of her that

> . . . once R. Yose was sitting in the market place and a certain matron came and sat on his right hand and her husband came and sat on his left. She said to him: Master, happy are you that I will be your foster mother in the world to come and my husband your foster father. He said to her: My daughter, why did you see fit to say this? She said to him: because your Scripture says: *And kings will be your foster fathers.* R. Yose tried to silence her and steer the conversation to other channels. She said to him: Master, why are you silencing me? You have another verse: *Thus says the Lord, the Redeemer of Israel, his Holy One, to him who is despised of man . . . kings shall see and arise, princes and they shall prostrate themselves.* If this will be fulfilled for you now, happy are you; and if in the future to come, happy are you. Happy are you for what is said to you, amongst you, and about you. R. Yose prefaced his remarks by saying: *In the multitude of my thoughts. . .* Even though the peoples of the world oppress us and subjugate us, and enforce their dominion over us, we are reminded of the consolations You have written down for us and we delight in them. . .[134]

[133] Possible proof of her ignorance of the sources is the fact that when "she asked R. Yose: Is it possible that Joseph, beeing seventeen years old, in the midst of the flush of his youth, would act like he did?!; he took out the Book of Genesis and began to read to her the stories of Reuben and Judah" (*Gen. Rabba* LXXXVII:6; pp. 1070–1071.) It follows from here that these incidents were as yet unknown to her! Furthermore, R. Yose did not read the Bible "with" her but "to" her.

[134] *Midrash Tanna'im* (from *Midrash Ha-Gadol*) XXVI 19 (p. 262). R. Yose's attempt to

As we have stated, it is not clear whether this woman actually did convert to Judaism or not. There were individual Romans, however, even at that age, who did become Jews. Such a type was Arius, who also addressed detailed questions to R. Yose and the Sages both in the area of Aggadah[135] and of Halakhah.[136]

In the next generation, too, once relations between Jews and Romans had again improved, the discussions continued. Of the conversations of those days, the exchanges between Rabbi Judah the Patriarch and Antoninus achieved special prominence. This affair requires separate and detailed treatment. Here we shall content ourselves with noting that, even in this period, the overall picture that emerges from an analysis of the sources does not differ appreciably from that of previous generations. Not many years after the death of R. Judah, however, at the commencement of the Amoraic period, when anarchy predominated in the Roman Empire, conditions changed. During the long period in which Judaism was downtrodden, despised and degraded, the phenomenon of dialogues between Jewish Sages and Roman leaders almost ceased to exist.

VI

The investigation of the dialogues between the Jewish Sages and Roman dignitaries found in talmudic and midrashic literature leads us to the conclusion that Tarn's[137] appraisal of the nature of the dialogues in Hellenistic literature does not generally apply to the discussions recorded in rabbinic sources. True, even this literature contains dialogues, here and there, that are mere literary stereotypes and in which the names of the participants make hardly any difference.[138] Yet, in so far as the total phenomenon is concerned, the situation is altogether different. A scrupulous examination of each and every topic discussed reveals that its choise was by no means accidental. Nor do the subjects constitute part of a general

silence the matron is explained by the conditions prevailing at the time. The incident occurred in the market place, in public. The woman's remarks might well have been taken for anti-government incitement and even sedition. R. Yose's personal experience (cf., e.g., Shabbat 33b), and the general situation in Sepphoris and Galilee in the generation after the promulgation of the decrees of persecution impelled him to stop her for fear of being reported to the government (he might even have suspected her of deliberate provocation).

135 *Sifre*, Deut. 13 (p. 22).

136 Tosefta Bava Meẓi'a 3.11. This question, which manifests expert knowledge of the halakhah on the part of the inquirer proves, that he was a Jew.

137 See n. 4 above.

138 Such as parts of the dialogues between Alexander the Great and the Sages.

"Wisdom literature". If we exclude a few general subjects,[139] which are indeed a tiny minority, the topics of the discussions and debates are most appropriately suited to the participants, as we know them, and their times. Admittedly, the literary aspect of the problem should not be ignored. Yet it seems that the chief importance of the dialogues does not lie in the area of philological or literary research. The examination of the significance of the discussions between Sages and Roman dignitaries furnishes us with a chapter of prime importance and interest in the domain of social history and the history of ideas, of the period of the Mishnah.

[139] Such as the "duration of the gestation of the snake".

THE NATURE AND CONTROL OF MINOAN FOREIGN TRADE

Malcolm H. Wiener

For Sinclair and Rachel Hood

THE PREPALATIAL BACKGROUND

Trade (along with many other activities) has been called the world's second oldest profession, and indeed the eagerness with which five-year-olds trade objects might suggest that trade is the oldest. In archaeological time also, trade can claim great antiquity as suggested by the appearance of Melian obsidian at various places, including inland sites on the Greek mainland beginning with the Paleolithic period (Perlès 1989;*c.f.*Torrence 1986).

On Crete EMII witnesses a great expansion of trade horizons, with the appearance of imports including gold, a silver seal, faience, ivory, and Egyptian stone vases on the islands. The contemporaneous burials at Mochlos give evidence for the first time of significant social stratification (Soles 1988, 49-61). From a tomb at Mochlos with EMIIA to EMIII material comes a bronze dagger of Cretan type (Branigan 1967, 214-215, Note 44), with a tin content of 4.8% (Herakleion Museum, HM 1560), suggesting the importation of tin to supply Cretan metalsmiths at this period. The first ostrich egg known in Crete, from a tomb at Palaikastro, also comes from this horizon (Dawkins 1903-1904, 192-231). Trade links to the north at this time are indicated by the probable Kythnian origin of the copper from which Minoan figurines and daggers found in Mesara tholoi are made (Stos-Gale 1989, 279-292), and by sherds from EH/ECII sauceboats from good EMII contexts (Wilson, D. E. 1985, 358-359).

THE MINIMALIST VIEW OF TRADE AND THE PROBLEMS OF INFERENCE FROM EVIDENCE

Does the limited evidence of overseas contact from the prepalatial period provide support for the minimalist view of trade advocated at this Symposium by Snodgrass and Catling? Or does the evidence cited merely hint at the true extent of trade, given the accidents of recovery and the possibility of trade in perishables leaving no trace? Of course even occasional cross-cultural exchanges between rulers could have had major consequences, such as the acquisition of knowledge of metallurgy and writing (particularly if the exchange involved gifts of artisans, a practice well-attested in Near Eastern texts). But was Bronze Age long-distance trade as limited in extent and nature as the minimalists suggest?

Three contrary arguments in particular seem worth noting. First, trade would always have consisted in large part of goods which leave no trace. The tale of the mid-11th century B.C. voyage of Wenamun, who travelled from Egypt to Byblos to purchase timber in exchange for significant quantities of linen garments, papyrus, ox hides, ropes, lentils and fish, plus gold and silver, is an excellent example of trade without a trace (Pernigotti 1988, 267-268; Dothan 1981, 4-5; Van Seters 1979, 37; Lichtheim 1976, 224-230; Gardiner 1961, 306-313). When the nature of trade goods can be determined from their containers the result is sometimes a surprise, as in the early Chalcolithic period in the western Mediterranean where, in the first half of the third millennium, Malta imported significant quantities of ochre from Sicily for use in funerary and other rituals (Maniscalco 1989, 541).

Second, harbour sites are particularly subject to loss through change of shoreline or reoccupation. Much of our knowledge of

prepalatial Minoan contacts with Egypt or the Near East comes from the island of Mochlos, which in Minoan times is thought to have been part of a peninsula. Detachment as an island here acted as a partial deterrent to post-Roman reoccupation or cultivation, thus protecting the tombs from discovery and looting. (Our other major source of evidence for overseas contact in the prepalatial period is Knossos, where the levelling of the hill, first perhaps before the construction of the Old Palace and again after the MMIIA destruction, scattered much of the evidence of earlier occupation.)

Third, the archaeological record tends in particular to preserve a deceptively small proportion of the metal in use at any time, since metal is always subject to melting and reuse. An illustration of the phenomenon is the contrast between the evidence for the existence of armour in the 11th century A.D. provided by the Bayeux tapestry on the one hand, and by the archaeological record on the other. In the tapestry, senior ranks on both sides wear iron-link tunics, but no Norman and only one Anglo-Saxon piece of the period survives (Wilson, D. M. 1985, 221). In the 17th century A.D., a silver brazier, or *brasero*, was a frequent item of equipment in upper class houses in Spain and France, but due probably to the large amount of silver these objects contained practically none have survived (Gruber 1982, 232). Similarly, Egyptian New Kingdom tomb paintings and temple reliefs depict a great number of copper ingots, but only one has ever been found in Egypt. The Annals of Tuthmosis III carved on his temple at Karnak record as booty 52 silver jars of Canaanite shape (Wrezinski 1923, Plates 33A and B, Item 100), but who has ever seen a Canaanite jar in silver? Few of the gold vessels depicted in the annals or in Egyptian tombs survive either (Lilyquist 1988, 39). The Kas ship-wreck disclosed ingots of tin and glass, otherwise unknown (except for some tin ingots from another shipwreck off Haifa), and an enormous number of copper ingots (Bass 1986). Near Eastern archives from Ebla, Mari and the Assyrian trading colony at Kültepe list great amounts of metal, practically none of which was found in the excavations. The paucity of bronze in LH-LMIIIB habitation sites and tombs led some scholars to suspect a IIIB bronze shortage, but the Pylos tablets suggest a total of about 400 bronzesmiths (Chadwick 1976, 141). The existence of this number of bronzesmiths in the territory of Pylos is surely of some significance, even if most receive only a small allotment of bronze and some none on the tablets in question.[1]

On balance, it would appear that the risk of underestimation of the amount and societal impact of long-distance trade in the Bronze Age is at least as great as the risk of over-estimation.

Snodgrass in his paper argues that trade by one definition - "movement of goods without knowledge of a further purchaser" - did not exist to any extent in the Aegean Bronze Age. Markets, he believes, were marginal and the concept of profit absent. Snodgrass envisages, instead, a process of ceremonial gift exchange between rulers involving high value, low bulk prestige items, accompanied by negotiated exchange of high bulk necessities and the systematic redistribution of these within Aegean communities. To this view certain objections may be raised. First, as Snodgrass notes, trade by any definition clearly flourished in the Near East in the Bronze Age. The principal function of the Assyrian trading colonies in Anatolia was the generation of profits for state institutions and private investors in Assyria. (See, *e.g.*, the papers by Garelli, Larsen and Veenhof in Hawkins (ed.), **Trade in the Ancient Near East** 1977; Adams 1974; and Veenhof 1972.) And the injunction contained in one letter -

"Sell at any price" - surely speaks the language of markets (Veenhof 1972, 88).

In any event, it is the effect of long-distance, cross-cultural trade that matters, rather than the purported intent. If, pursuant to a carefully negotiated agreement the Pharaoh sends a gift of a thousand Egyptian stone vases filled with unguents to the King of Babylon in exchange for other goods (Moran 1987, 99-100; Knudtzon 1915, 118), and some of the vases are distributed within Babylon while others are exchanged elsewhere, then the result in fact is trade. Conversely, a ceremonial gift exchange relationship between rulers, even one maintained despite the availability of equivalent supplies at lower cost elsewhere, need not necessarily constitute "archaic" non-profit-maximizing behaviour, when viewed in the long run. A rational purchaser may elect to maintain a long-term relationship with a higher-cost supplier in order to insure access to a critical resource (such as metal in the Bronze Age) while satisfying any increase in demand from a lower-cost source. It is appropriate at this point to recall the adage: "Markets [*i.e.*, prices] are made at the margin". It would be surprising if Minoan trading ventures did not seek out the lowest cost source of metals and other goods from time to time. Moreover, royal emissaries/merchants throughout history have traded on their own account in the course of their missions, as in the case of the merchant ambassadors of Zimri-Lim of Mari in the 18th century B.C., some of whom used the occasion of royal journeys to make private purchases for future sales (Sasson 1984, 248). As Adams observes, "The analytical separation between 'administered' and 'market' trade may, in other words, lack a cognitive or behavioural equivalent" (Adams 1974, 239).

While distinctions between "market" and "administered" trade, or between "trade" and "exchange", do not seem particularly fruitful, the question of the role of the state in comparison with the role of other entities and of individuals in long-distance, cross-cultural trade appears of critical importance for our understanding of the governance and economy of Crete and the development of Minoan civilization.[2]

Minoan Overseas Trade in the Old Palace Period

What, then, was the nature and structure of Minoan overseas trade in the Old Palace period? In a 1984 symposium Alexiou (1987), Kopcke (1987) and Wiener (1987) argued for a strong palatial role in this trade, the last named emphasizing the need of the palaces to insure access to supplies of copper and tin, or bronze. This paper expands on that discussion, then considers the current state of the evidence regarding the control of Crete in general (including overseas trade) in the Old Palace period, and ends with a brief postscript on the control of foreign trade during the New Palace period.

Bronze, of course, was of critical importance for weapons, for tools to build palaces and ships, and for prestige objects - that is to say, bronze was of critical importance to the security, economy and prestige of the palaces. Above all, the palaces would have wished to insure and control the supply of weapons in troubled times. (A discussion of evidence for warfare in protopalatial Crete appears below.) Accordingly it seems inconceivable that Minoan rulers would simply have waited passively, hoping for a Near Eastern merchantman to arrive with copper and tin. Rather, it seems likely that copper and tin would have been the object of intensive search, planning and investment by the controlling elite.

Middle Bronze IB to II was a time of intensive trade, including trade in metals, in the Near East. From the approximately 5% of the Karum Kanesh tablets published to

date, we know already of 110 donkey loads carrying 13,500 kilos, or almost 15 tons, of tin into Anatolia, enough to produce (assuming a 5%-7% tin content) 200 to 300 tons of bronze. Adams in his analysis of Near Eastern trade observes that the amount involved seems considerably in excess of local needs, and accordingly suggests that the tin was alloyed with copper in Anatolia and the resulting bronze shipped elsewhere (Adams 1974, 239). One tablet from the palace at Mari on the Euphrates records over 500 kg of tin in the palace inventory, or enough for 8 to 10.5 tons of bronze. The tablet shows that the tin came to Mari from the direction of Iran and went to many places including Aleppo, Hazor and Ugarit, where two resident and probably Mariote tin merchants are mentioned. If "Kaptara" was indeed Crete, as is generally believed, then the connection of Crete to this tin route is established by a reference in the same text to tin destined for a man from Kaptara and an interpreter resident in Ugarit (who is to be paid in tin for his services). Other Mari tablets refer to a Kaptarite inlaid metal weapon, and to Zimri-Lim of Mari sending goods from Kaptara to Hammurabi of Babylon - an example, perhaps, of "down the line palatial gift exchange" (Villard 1984, 528-529, number 556; Kupper 1973, 8-22; Malamat 1971, 31; Dossin 1952, 3, 37 [Letter 20] and 1970, 97).

The existence of an interpreter suggests regular contact, trade beyond the scope of sign language or a tourist shopping vocabulary, and an increased likelihood of exchange of significant knowl-edge and stimuli between Crete and the Near East during the Old Palace period. Judith Weingarten has recently argued that the first complex administrative system of Crete for which we have evidence, that of the palace at Phaistos in MMII, shares certain specific characteristics with the system in use at Karahöyük in Anatolia, such as the use of multiple sealings and seals which are extremely similar but not identical, as well as a few specific design motifs previously noted by Levi. Weingarten notes that Near Eastern specialists have only recently begun to study sealings with respect to their function in administrative systems, but believes on present evidence that the Minoan system was imported in its entirety from somewhere abroad, probably coincident with the foundation of the first palaces in Crete (Weingarten 1990, 105-106).

Ports along the coasts of Anatolia and Syria were obvious destinations for Middle Minoan voyagers seeking tin or bronze. Accordingly it is not surprising that Middle Minoan pottery (including open shapes which could not have served as containers for Minoan exports), much of it said to be MMII in date, has been found along an island chain including Kasos, Karpathos, Rhodes, Kos, Chalki, Kalymnos, Telos, Nisyros, Asty-palaea and Samos, and that Middle Minoan stone bowls have been found on Samos and Rhodes, with the latter producing evidence of local manufacture of stone bowls of Minoan type as well. MMII sherds are also known from the Anatolian coastal sites of Miletus, Iasos and Knidos (Wiener 1984, 17-25 and forthcoming). Conversely, pieces of obsid-ian, linked through trace element analysis to the Çiftlik source in southern Anatolia (near mines identified by Yener as potential sources of silver and other metals in the Bronze Age), have been found at Knossos (Renfrew, Cann & Dixon 1965, 225-247; Yener, Özbal, Minzoni-Deroche & Aksoy 1989, 477-494; Yener, Sayer, Özbal, Joel, Barnes & Brill, forthcoming). Cypriöt sherds have been recovered from a MMIB context at Kommos (Watrous 1985, 12), and Minoan pottery from the beginning of the Old Palace period has been found at Lapithos and Karmi on the north coast of Cyprus.

In the foregoing discussion emphasis is

placed on the necessity of obtaining bronze because of the active Minoan maritime role which such a need implies. Minoan imports were of course not limited to bronze. Gold, silver, ivory and various types of stone arrived, the last in the form of Egyptian vases which were then reworked into Minoan forms (Platon 1971, 137-138) and in the form of raw material. Yule (1981, 199) catalogued 135 seals made from six different Near Eastern stones found in Crete and belonging to the MMII-III horizon; Branigan (forthcoming) calculates that at least 15% of all known Cretan Old Palace seals were made from Near Eastern stones. Lead, probably from Laurion, was imported for rivets and plugs and for linings such as those used to waterproof the cists in the West Magazines of the Palace of Knossos. It is reasonable to assume a palatial interest and role in such imports.

Minoan exports, in addition to Kamares ware pottery, may have included wood, oil (possibly perfumed), woollen cloth and agricultural products (including wine and medicinal herbs). The annals of Tuthmosis III speak of ships of the Keftiu in Levantine ports laden with poles, masts and great trees destined for Egypt (Breasted 1962, 206). An Akkadian type of wood (thought to be poplar or willow) is called "Kaptura", a term believed to mean "Crete" or "Cretan" (Astour 1973, 22). Both elm and willow are recorded later in the Linear B tablets from Knossos (assuming no shift in the names of various woods between Linear B and Classical Greek) with willow mentioned frequently as the material of which chariot wheels are made (Ventris & Chadwick 1973, 370-373; I am grateful to T. Palaima for this reference.). In the 5th century B.C. Crete exported cypress wood; in the 16th century A.D. travellers reported the Samaria Gorge in western Crete was the chief source of cypress in the Venetian Empire (Nixon, Moody & Rackham 1988, 168-169). The proximity to forests may account in part for the location and significance of the Old Palace site of Monastiraki, considered below, and the New Palace site of Zominthos. An Egyptian tomb of the 18th Dynasty depicts Keftiu bearing folded cloth (Kantor 1947, 58). Linear A tablets from Ayia Triadha indicate that it was a centre of wool production in LMIB (Palaima 1990, 94-95). From the Knossian Linear B tablets we know that wool production was a major element of the Minoan economy at that time (Killen 1964, 1-15). A Mari tablet (ARMT 21 342:4-12) records clothing and a pair of leather shoes from Kaptara (Sasson 1985, 451). Egyptian texts of the early 18th dynasty refer to the importation of medicinal herbs and of lichens for embalming fluid from Keftiu, the Egyptian term generally thought to mean Crete (Sakellarakis 1984, 197-203). Egypt was no doubt a ready market for wood, olive oil and wine, all of which it lacked. (In the 18th century A.D. Crete exported wood, olive oil, woollen cloth, wine, herbs and currants to Europe [Cadogan 1976, 16]).

Long-distance trade with the eastern Mediterranean and Egypt would have required the following: first, ships suitable for long voyages, which could have served as well for attacking pirate lairs, together with ships' crews and provisions, plus shipyards and shipwrights; second, goods for exchange, in some cases of a kind sufficient to interest foreign rulers; third, establishment of relations with foreign courts and ports; and fourth, a chain of safe harbours, such as those noted, on the route to the metal sources. While there may have been periods of maritime security and partial suppression of piracy in the eastern Mediterranean, stemming perhaps from *entente* among the great powers during which maritime rights were respected (Sasson 1966, 138; Revere 1957, 38-63), when a single private merchantman carrying goods of high value

could have embarked on a long voyage, numerous Late Bronze Age Near Eastern and Egyptian texts indicate that naval attacks and piracy were endemic at times (Portugali & Knapp 1985, 66 and sources cited therein). There are numerous references also to fleets of ships in Egyptian and Near Eastern records.[3] While there is no reason to assume that long-distance overseas trade was the exclusive prerogative and domain of the palaces in Middle Minoan Crete, it seems highly probable that the palaces provided the critical incentive, investment and infra-structure required.

This view, however, has been challenged by Branigan, who argues that the frequent appearance in Cretan non-palatial contexts of Egyptian scarabs, Near Eastern cylinder seals, Syrian daggers, Egyptian stone bowls, and objects made of bronze strongly suggests a limited palatial role in the overseas trade of the Old Palace period (Branigan 1989, 65-71 and forthcoming).[4] The argument appears unpersuasive for the following reasons. (1) The scarabs may simply have been the tourist trinkets and trading tokens of mariners; the scarabs from the Kas shipwreck off the coast of Anatolia of about 1300 B.C. seem to be mostly bric-a-brac or heirlooms covering a period of over 200 years, and Phoenician and Classical scarabs have been found as far afield as Britain and Scandinavia. (2) Cylinder seals travel in a similar manner; specimens of Collon's Green Jasper Group have been found in a MMIII-LMI tomb in Crete, in a much later context at Kition, and even at Carthage (1986, 62-63). Moreover, there is no evidence that Near Eastern cylinders were ever used as seals in Crete. In any event, only three of the seven cylinder seals cited by Branigan come from non-palatial contexts, and those three come from tholos tombs in the Mesara. While it is conceivable that some members of the palatial elite may have elected to be buried in long-established family or clan tholoi, these Mesara tombs are not generally thought to be the burial places of the palatial elite, unlike Tholos B at Arkhanes which may well have held the remains of a palatial elite. What may be a royal burial enclosure at Chryso-lakkos was thoroughly looted, so we have no palatial analogue to the Mesara tholoi to indicate how many seals a royal tomb contained. (3) Three of the five Syrian daggers with tangs also come from Mesara tholoi as does one Syrian dagger of another type (Koumasa tholos); the other two come from sacred caves in the Lasithi Plain, where the rich deposits may have included palatial offerings. Finally, the tang from what may be a Syrian dagger was found at Knossos (Branigan 1970, 182 and personal communication. I am most grateful to K. Branigan for his comments and assistance, given generously notwithstanding our differing views on the question at issue.). (4) As to the Egyptian stone vases, of the twelve prepalatial examples six come from palatial contexts and five of the remaining six, listed as non-palatial by Branigan, come (as he notes) from a deposit immediately adjacent to the NW corner of the Palace at Knossos, an area within the outer enceinte wall of the Old Palace. (5) Branigan also notes 92 bronze objects appearing outside the palaces versus 14 within during MMI-II, but observes that these figures are difficult to assess accurately because of incomplete publication, variation in quantity of raw material used for individual objects, and other reasons. In addition to these caveats, we should note that different parties may be responsible for importing metals on the one hand and production of implements on the other; a smith in a town, for example, may receive copper and tin from a palace and manufacture implements for his locality and local cult as well as status objects for the palace and palatial shrines. Such extra-palatial issuance of metal is documented at the end of the Bronze Age in the Pylos tablets. Moreover, the comparison once again is between non-

palatial tombs and palatial habitation sites; bronze from the latter was of course usually recovered and reused. The frequent disappearance of metal from the archae-ological record was noted above. Our fortuitous knowledge of the great amounts of bronze present in Crete in the neopalatial period comes from (1) the LMIB destructions and (in some cases) abandonments, (2) the bronze hoards buried in evident anticipation of them (Georgiou 1979), (3) the Arkalochori Cave deposit, discovered as it was being looted, and (4) the Minoan bronze swords and vases preserved in the Shaft Graves of Mycenae. Equivalent information is lacking for the Old Palace period. Thus we are at risk of underestimating the amount of bronze available then, although the total amount was obviously less than in the New Palace period when Crete appears to have been extremely rich in bronze.

If we examine items of trade or trade-related gift exchange likely to have been of great interest to the palatial elite, including objects dependent upon imports of metal, a pattern of distribution different from that suggested by Branigan may be observed. For example, the palace at Malia contained great swords of likely MMII date. Sandars has described the largest of the swords as "a weapon of unsurpassed size and considerable magnificence", and noted that "the armourers of Egypt and the Levant could produce nothing to compare with them" (Sandars 1961, 17-29 and 1963, 117). While these swords were of course ceremonial, surely their manufacture was based upon a tradition of functional sword production. Such swords constituted a major advance in military technology, at least in their *in terrorem* aspect, and hence would have been of vital interest to the palaces. Branigan observes that the luxurious and exotic nature of the gold pommel of one of the Malia swords, which depicts a backward-bending acrobat with what Branigan describes as African hair, is indicative of a strong palatial interest in foreign trade. From an area at the northwest fringe of the palace of Malia came carved steatite molds for casting axes and blades, associated with a redeposited fill of MMI to II material. A metallurgical installation of the Old Palace period was discovered in the same area, adjacent to the northern wall of the later palace (Pelon 1987a, 269-271).[5] A controlling palatial role in metallurgy, and in sword production in particular, seems likely in view of the foregoing considerations. Indeed, the number of destructions (discussed below) probably attributable to warfare in MMII-IIIA suggests the possibility that an "arms race" may have been partly responsible for an intensive effort to acquire copper and tin, or bronze.

In addition to ships, shipyards and armed men at times to battle pirates, long-distance trade voyages to obtain metal and luxury items required that goods desired abroad be provided for exchange. If one accepts the equation of Kaptara and Crete, then the Mari texts concerning inlaid metal objects from Kaptara, and the Kaptarite (as well as Egyptian) origin sometimes ascribed to the god of crafts at Mari, suggest the palatial nature of some of the goods exchanged. (That rulers may have exchanged luxurious cere-monial and prestige objects as gifts, and that such exchanges facilitated trade relationships between states, does not necessarily imply, however, that trade consisted solely or largely of such exchanges.)

The creation of the first palaces in Crete sees the concentration of craft production, with palatial workshops combining various crafts (MacGillivray 1987, 277). Other workshops located near the palaces but outside their walls may also have been under palatial control. The concentration of agricultural surpluses in the Old Palaces is indicated by the textual evidence (Palaima 1990, 91-92)

and by the significant storage capacity of the koulouras (underground storage silos). At Knossos the three koulouras in the West Court alone could hold sufficient grain to feed 800 people for a year, and at Phaistos the West Court koulouras could feed 300 people for a year.[6] The concentration of administration in the early palaces is shown by the more than 6,500 nodules or seal impressions, plus tablets and other inscribed items, from one room at the palace at Phaistos. The recording of goods in and out was obviously of great interest to the palace.[7] It would be surprising in this context if the palaces did not also play a predominant role in the organization of long-distance trading ventures.[8]

The non-textual archaeological evidence for Minoan exports in the Old Palace period consists principally of stone bowls and Kamares ware vessels. There is evidence for stoneworking in basement rooms LI-LV of the Old Palace at Phaistos (Branigan, forthcoming). Fine palatial Kamares in Crete is found almost exclusively in the palaces and in peak sanctuaries and caves connected with the palaces, and it is largely this Kamares ware which appears abroad. The exception to this rule is the east Cretan ware which appears occasionally in Egypt, and whose presence abroad may be due to the role of Palaikastro as a port (MacGillivray & Driessen, forthcoming), as well as one jug found at Aswan which, if not from Palaikastro, may come from Malia (Cadogan 1983, 516). Of course the total number of Kamares ware sherds now known from the Near East and Egypt may represent no more than 50 vases, but other such sherds may await publication, as in the case noted. More significant in terms of control of foreign trade is the fact that palatial Kamares ware has not been found or imitated in the hinterlands of the Minoan palaces (Walberg 1987, 284) but appears frequently and is sufficiently known to be imitated locally at ports in east Crete, sites along the coast of mainland Greece, the Cyclades, the Near East (where it is copied in Ugarit and appears as far inland as Qatna in Syria) and in Egypt as far up the Nile as Abydos (Schaeffer 1939, 22, 54-56 and 1949, 51, Figure 109A and Plate 38; Saltz 1977, 51-70; Kantor 1947, 19; Betancourt 1984, 90-92; Cadogan 1983, 512-518; Kemp & Merrillees 1980, 1-3, Plate 1, 200-201, Figures 59-60, Colour Plate opposite 176; Wiener 1984, 18 and 1987, 262, Note 9).

Perhaps the metal prototypes on which Kamares ware appears based (Evans 1921, 242-245; Walberg 1976, 34-39), and which may have been made in the same palatial workshops (MacGillivray 1987, 277), were prized in the East. Tablets from Mari refer to bronze vessels and pincers from Kaptaru. In Quartier Mu at Malia a clay mould which had been formed over a metal bowl generally similar to the silver bowls from the Tôd Treasure has been recovered (Detournay, Poursat & Vandenabeele 1980, 89; Poursat 1984, 87). Of course if the silver bowls in the Tôd Treasure with their affinities in decoration to Kamares ware (Bisson de la Roque 1950; Warren & Hankey 1989, 131-135, 170, Notes 9 & 10, Plates 5-11) come from Crete, they are likely to have come from a palace, and the bronze boxes bearing the cartouche of Amenemhet II in which they were found in a temple in Egypt suggest that they may have been a gift to the temple from the pharaoh, again suggesting that palatial gift exchange played a prominent role in Middle Minoan overseas trade. Some of the palatial Kamares ware, on the other hand, was found in workmen's houses at Kahun. Poursat and S. Immerwahr have concluded on the basis of examination of the Egyptianising motifs of moulded clay reliefs from Malia and fragments of the earliest Minoan wall painting that Minoan artists travelled to Egypt in the Old Palace period (Poursat 1984, 86-87; Immerwahr 1984, 87). If so, it seems likely that they would have

accompanied a Minoan ambassadorial voyage.

The discovery at the Palace of Knossos of part of a diorite statue of an Egyptian Middle Kingdom official named User may be relevant to the question of the palatial role in Minoan-Egyptian trade in the Middle Bronze Age. Found in an unstratified context 70 cm below the pre-excavation surface of the palace, the object could have arrived as a piece of black diorite raw material rather than as a statue. (The excavation of Myrtos-Pyrgos produced a piece of Egyptian stone possibly reworked as a foot amulet [V. Hankey 1976, 213, Note 9]). The User fragment could also have come, however, from an Egyptian statue of a type known from the Middle East and thought to have been deposited in local shrines by Egyptian emissaries while abroad (Uphill 1984, 213). Uphill notes that these statues, which in Egypt were deposited in temples to receive offerings, have been found in the Near East in cult places either in or near ports or in important towns on main trade routes. While the unstratified and incomplete User statue can hardly be considered persuasive evidence of the presence of an Egyptian ambassador or resident agent at Knossos, it would also be unwise to ignore this possibility.

Could persons not directly connected to the palaces have amassed enough capital to play a significant role in long-distance overseas trade, perhaps by following in the wake of palace-directed trade? The Old Palace period appears to lack the number of luxurious, extra-palatial dwellings near the palaces and the number of prosperous towns and villas that are so marked a feature of neopalatial Crete, but we cannot exclude the possibility of an independent merchant class. After all, gold, tin, ivory and ostrich eggs were brought to Crete, as we have noted, before there were any palaces, or at least before there were any palaces as we subsequently know them. In the absence of texts, we cannot hope to know the nature of the relationship between the Old Palaces and Minoan ship captains. The remuneration of captains and crews may have taken the form of authority and license to trade on their own, as long as the palatial mission, including in particular the procurement of metal, was accomplished. A specialist group of traders could have emerged as a result of such voyages. A class of at least semi-private merchants, often connected in some way to palace or temple, developed in the Near East[9] where, however, long-distance overland trade is likely to have been more extensive than the sea trade between Crete and the Near East, as shown by the data on Near Eastern metal trade cited earlier.

In Crete, however, it was surely the palaces which provided the basic infrastructure for long-distance trade, including (1) ships in strength, (2) relations with foreign courts and ports, and (3) capital, including luxury and other products used in exchange. For example, the manufacture of the inlaid metal weapon from Kaptara to which a Mari document refers would have required access to precious and other metals and experience with a sophisticated pyrotechnology gained over time, which strongly suggests that the object was fashioned in a palatial workshop.

A trading expedition carrying valuable goods would have required either protection by naval military strength (as in the case of Viking trading expeditions), respect for the power behind the venture, previously established friendly relations with both the arrival area and any way stations en route, or some combination of these elements. Kopcke has put the proposition as follows: "The farther the distance, the more organized the forces one expected to encounter, the greater the gains, [then] the more thoroughgoing the preparations. 'States' were better equipped to

meet these challenges than individuals" (1987, 257).[10]

CONTROL, CONFLICT, COMPETITION AND/OR COOPERATION BETWEEN THE OLD PALACES AND THE EFFECT ON FOREIGN TRADE

Kopcke's reference to "states" raises the question of the number of polities involved in sponsoring long-distance trade, and perhaps establishing relations with foreign courts, in the Old Palace period. In the absence of texts we must again admit to great uncertainty. It appears likely that a poll of Minoan prehistorians would show a majority favouring the existence of at least three independent palaces in the Old Palace period, but (perhaps by a smaller majority), Knossian domination in the New Palace period.

The dividing line between the periods is generally taken to be a great earthquake which at least at Knossos (and perhaps simultaneously at Phaistos) marks the end of the Old Palaces and the construction of the New Palaces (Warren & Hankey 1989, 61-65). A problem arises, however, in attempting to describe a process by which an earthquake might lead to dramatic change of this nature in the governance of Crete or the control of its foreign trade. One possibility of course is that the destruction at Phaistos and in the surrounding area (probably including Kommos, where there is also some evidence of earthquake damage at this time) was greater than that at Knossos and its surrounding area (including Archanes and Anemospelia, where there is also evidence for earthquake damage perhaps at this time). The amount of damage implied at Knossos, however, by the remains of the House of the Fallen Blocks (and the uplift visible on the slopes of Juktas and Ailias, together with the fault lines in the Kairatos Valley, if attributable to this earthquake) is certainly considerable. Of course it is possible to imagine a great earthquake causing (1) delegitimizing damage to the authority of a ruler and/or hierarchy, religious or other-wise, and its replacement by a different elite with different dynastic ties and more inclined to aggression; (2) shortages of foodstuffs leading to aggression, or (3) a period of weakness leading to attacks on Knossian dynastic affiliates or allies if not on Knossos itself, followed by counterattack and con-quest. On the other hand one can imagine, perhaps more easily, that as a result of a devastating earthquake attention would for a time turn inward toward repairing the damage.[11] Accordingly a further consideration of the horizon in which Knossos may have taken the initial steps toward Cretan dominance, perhaps including dominance of foreign trade, seems in order.

The position as regards the Old Palace period has been stated emphatically by Cadogan, who after noting the existence of considerable regional diversity in the Middle Minoan period, particularly as reflected in pottery, writes ". . . **in no way** may we see Knossos as capital of Crete in Old Palace times, even though it was even then considerably larger than Phaistos or Malia -- let alone the possibility of its having a commanding position in the whole south Aegean" (1987, 72). On the other hand, a number of reasons have been advanced for the view that Crete was united under Knossos in the New Palace period. These include the secure and peaceful appearance of Crete as shown by the existence of unprotected "country houses", the expansion of Crete abroad, the spread of Knossian-inspired pottery styles throughout the island in place of the regional diversity of the Old Palace period, the possible economic control by Knossos implied by the distribution of sealings made by Knossian seals, and the nature of the site of Kato Zakros and the objects found there which suggest it may have served as a port for Knossos (Wiener 1987, 266 and works cited).

The separate ceramic zones of central, east

central and eastern Crete in MMII noted by Cadogan and others (Cadogan 1983, 507-518 and 1988, 95-99; Walberg 1983; Poursat 1987, 75-76; Andreou 1987) and the ceramic differences between the northern (Knossian) and southern (Phaistian) sectors in the central zone (Betancourt 1986, 284-292) are reinforced by what appears to be a special east central style of carpenter's tools (Poursat 1984, 75). The palatial Kamares pottery of Knossos and Phaistos, on the other hand, is very similar, as are the palaces in general in overall design, characteristics of construction (e.g., ashlar with orthostates, masons' marks) and cult areas and equipment. With regard to the possible implications of pottery zones, it is worth noting that the east-central, Malia-Pyrgos style does not appear in east Crete or the Cyclades, whereas Knossian Kamares appears in some quantity both at Palaikastro and Zakros (where it is also imitated) and in the Cyclades; and that conversely much east Cretan and Cycladic pottery has been identified in the Middle Minoan deposits from Knossos (MacGillivray 1987, 249, 276 & 278). By MMIII the regional differences in pottery have largely disappeared (Walberg 1983, 151). Accordingly the argument based on pottery and other cultural artifact zones for independent polities throughout the Old Palace period does not appear compelling.

Moreover, there is no reason why a Knossian assertion of sovereignty over certain parts of Crete in the Old Palace period should necessarily result in the closure of local pottery and other workshops or in their prompt adoption of Knossian styles or techniques, nor is there any reason why Knossian sovereignty would necessarily result in the rapid diminution of local exchange networks. Recent work in contexts where political relationships are known has shown that the circumstances under which political boundaries find clear expression in material culture are "highly variable and very complex" (Cherry 1986, 24, citing Hodder 1977; 1978, 199-269; 1982; and DeAtley & Findlow 1984). (Conversely the subsequent marked reduction of regionalism in the pottery of the neopalatial period, standing alone, could result from an internal "Versailles effect" reflecting the cultural prestige of the Palace of Knossos and the consequent stimulus to importation and emulation of its products by the rest of Crete, rather than from the putative Knossian neopalatial hegemony in Crete.)

Another argument for politically independent regions centred on palaces in Minoan Crete has been proposed by Cherry (1986) on the basis of cross-cultural studies indicating that many societies have passed through a stage of "peer polity interaction" en route to larger federations, and on the basis of the presumption that a polity comprising a Cretan palace and its hinterland constitutes a natural unit for the Bronze Age from the standpoint of political geography, as indicated by the example of Mycenaean Greece. Considering, however, that large and imposing structures appear in Crete in EMIIB (Branigan 1970, 43), together with indications, in the burials of Mochlos (Soles 1988), of a highly stratified society with access to foreign luxury products, and that the Old Palaces are in existence by MMIB-MMIIA, there seems a sufficient span of centuries to encompass a peer polity interaction phase prior to the earliest possible assertion of Knossian dominance in the Old Palace period. The existence of a direct link between control and topography is also open to doubt, as the later history of Crete and of the Aegean indicates. In the 5th century B.C., for example, the era of independent city-states was followed by an Athenian Empire which exercised control of Aegean trade, particularly in that basic commodity known as corn in the United Kingdom and wheat in the United States (Thucydides 2.38.2, 1.120.2; cf. 3.86.4; Rhodes 1985, 38). Cross-cultural comp-

arisons with Middle and Late Bronze Age societies in the Near East and Egypt with which Minoan palatial rulers would have been familiar disclose that Zimri-Lim of Mari had five palaces and spent a great deal of his time travelling between them (Sasson 1990; see Bottèro 1957) and that Amenhotep III had major palaces at Malkata and at Medinet Gurab at the entrance to the Fayum, and built a lake (presumably with an accompanying palace) at a site thought to be Akhmim, the home of his wife Ty, in middle Egypt (Wiener 1987, 266, Note 47).

Accordingly, it seems appropriate to ask whether there is evidence to suggest that Knossos may have taken the initial steps towards hegemony, at least as regards north-central and east Crete, in the Old Palace period.

The first body of evidence to consider is the chain of hilltop watchtowers or caravanserai, and perhaps in some cases forts, arranged in line of sight along roadways, perhaps most noticeable in east Crete but recognizable elsewhere as well. In east Crete alone over 40 have been identified, many of a seemingly canonical size of about 14 by 11 meters, and extending along roads leading inland out of sight of the sea in some cases, suggesting that the provision of internal rather than external security was their primary function.[12] Moreover, it is difficult to identify a foreign threat against which the road and watchtower system could have been directed, although the possibility of Anatolian or Syrian pirates cannot be totally discounted.

Chryssoulaki has now completed the excavation of Zakros Choiromandres, the largest and best preserved of the known east Cretan watchtowers, and has confirmed an MMII date for its construction (Tzedakis, Chryssoulaki, Boutsaki & Venieri 1989, 43-75). Chryssoulaki believes the visible remains of the road system watchtowers or caravanserai remaining to be excavated show signs of the employment of MMII building techniques, a judgement shared by MacGillivray (personal communications, for which I am most grateful). A viaduct near the watchtower/caravanserai at Zakros Choiromandres appears to be part of the road and tower system, and thus of the same general horizon as the viaduct constructed at Knossos in MMIIA; future excavation will test this hypothesis. (I am grateful to J. A. MacGillivray for informing me of the viaduct at Choiromandres.) Some of these structures and the associated road system were noted long ago by Evans, who referred to the structures as Minoan guard stations or "phrouria" (1928, 76). With J. L. Myres he was able to trace along a route through the Lasithi district to Siteia "the repeated occurrence of such guard- or watch-stations along the course of a Minoan built way, similar in all respects to that which traverses the central sector of the island" [footnote omitted]. Evans continues, "In view of these consistent phenomena it seems impossible not to admit the conclusion that the great Minoan road-system that radiated from Knossos over the whole of the central and eastern districts was also planned with a certain strategic control by the Minoan Priest-King" (1928, 78-79; Pendlebury, Eccles & Money-Coutts 1932-1933, 99). Evans collected MMII sherds from several of the watchtowers (Evans 1928, 78) and from the one at Ziros a signet with a hierographic inscription dated by Yule to MMII (1981, 85-88; Evans 1921, 275, Figure 204H; see also Pendlebury 1965, 147. Evans refers to the site as Sto Dhaso). Evans describes the road system and guard towers in numerous early publications (collected in Tzedakis, Chryssoulaki, Boutsaki & Venieri 1989); subsequent investigations have concluded that some of Evans' examples of Minoan roads were probably sections of medieval or Turkish kalderimi (W. McDonald, personal communication, for which I am most grateful). Pendlebury noted many

of these watchtowers/caravanserai in his travels (1965, 10, Note 1).[13] Pendlebury also noted that many of the remains observed by earlier travellers, such as the walls of Kisamos noted by Buondelmonte in 1422, had disappeared (1965, 16). The process continues today; Chryssoulaki reports that the remains of three of the 40 watchtowers noted by her team in the first season have been removed by local farmers (personal communication). Accordingly the number throughout Crete in the Bronze Age may have been far greater than is apparent today.

If the watchtowers/caravanserai and road system is in fact largely of MMII date, then on present evidence the system existed prior to significant habitation in the valleys behind the east Cretan coastline, a circumstance which suggests central, or at least regional, planning and administration rather than local defense to protect women and livestock against brigands; the farmsteads which later occupy these valleys seem to be neopalatial (MacGillivray and Chryssoulaki, personal communication). A large, imposing building surrounded by a wall with projecting towers excavated by Dr. Tsipopoulou at Ayia Photia on the eastern coast of MMI-II date may provide upon final publication important new information concerning the control and defense of east Crete.

Whether these roadways and the accompanying watchtowers, fairly uniform in appearance and ambitious in geographic scope, were built at the direction of various regional centres or centrally inspired from Knossos, and whether they were constructed cooperatively or competitively, will be difficult to determine. "Peer polity" competition (Renfrew and Cherry 1986) may exist with regard to roadworks as with other matters, particularly when the spur of military competition or necessity is added. Indeed, it is possible that in parts of Crete the roadway and watchtower system was directed against Knossos. Elsewhere in the Aegean, Phylakopi on Melos is rebuilt during MMIIA, to judge from the fine MMIIA jars and cups from Knossos which appear, and a fortification wall at the site may have its origin in this period, although the evidence as to date is unclear (Barber 1987, 67-68). Ayia Irini on Kea is also rebuilt and reoccupied, receives Knossian pottery, and sees a fortification wall built in this period (Barber 1987, 68; MacGillivray, forthcoming A). Again, these fortification walls may have been intended to encourage Minoan contacts through trade instead of raid.

It is worth noting in connection with the suggested construction of a roadway and watchtower network covering much of central and east Crete at this time that the MMIIA horizon sees a marked increase in level of ambition and deployment of labour at Knossos and Phaistos, as indicated, *inter alia,* by the erection of monumental buildings with complex pre-planned drainage systems, by the quarrying and transportation of large ashlar blocks for building and by the construction of the koulouras, Royal Road and viaduct at Knossos. (MacGillivray [1989 and forthcoming B] and Momigliano [1989] have advocated a MMIIA horizon for various developments which Evans placed in MMIB.) It is possible that the same general horizon saw monumental construction at Malia, as suggested by the results of recent excavation under the northwest quarter of the Late Minoan palace (Pelon 1987a, 271; 1987b, 189, 195).

We have already noted the appearance of great swords in MMII, and the developed tradition of metallurgy and weapon manufacture on which they depended. Moreover Minoan prowess in metal weapon production was not limited to the long sword, but included the short sword, the solid long dagger and the shoe-socketed and tube-socketed spearhead and arrowhead, all of which may

have made their first Aegean appearance in Crete (Hiller 1984, 27, 31).

Fire destructions of large areas of major sites occur in MMII, but it is of course always difficult to say whether such destructions are the result of warfare, earthquakes or even accidents setting off widespread conflagrations. Any of these could have caused the fire destructions around the end of MMIIA at Knossos and Phaistos. Some of the destr-uctions of major sites toward or at the end of MMIIB (or the beginning of MMIIIA -- MacGillivray, forthcoming B) may well have been caused by warfare. Phaistos at this time suffers a major destruction by fire sealed by a layer of *calcestruzzo* (cement rubble) after which large parts of the Old Palace are rebuilt. Nearby Kommos may have suffered a destruction also, but further excavation is required to determine its extent and precise horizon. What may have been an early palace at Monastiraki, lying midway on the natural route from Phaistos and the Mesara to Rethymnon on the north coast, and with sealings and pottery resembling those of Vano 25 at Phaistos (Ferioli & Fiandra 1990, 222, Note 4 and 224; Kanta 1988, 313), is completely destroyed and (perhaps more significantly) abandoned at the end of MMIIB. There is no way at present of determining whether the destruction and abandonment of Monastiraki was due to warfare involving Knossos, Phaistos or both, or to natural causes.

In the east central zone, at Malia a major administrative, storage and cult area, Quartier Mu, is also destroyed at the end of MMIIB (as defined at Malia) and never reoccupied; the excavators believe that the most likely cause of the destruction was deliberate human agency.[14] (Poursat believes this destruction may occur at the same general time as the destructions at Knossos and Phaistos at the end of the Old Palace period [1982, 677]). A major destruction of Pyrgos on the south coast to the east of Phaistos may be assignable to this general period as well. A tower, walls and a cistern had been built at Pyrgos prior to the destruction, possibly as a defensive measure (Cadogan 1977, 70-84; Walberg 1983, 151).

Of course hegemony need not result from warfare, warfare need not necessarily result in widespread destruction of sites, and destruction caused by fighting may be repaired and hence difficult to detect in the archaeological record. However, given the number of destructions of major sites, at least some in all likelihood resulting from warfare in MMII, it seems appropriate to note the possibility that MMII witnessed the initial steps towards the assertion of Knossian hegemony, at least as regards north-central and east Crete, together with some degree of control over long-distance trade.

Other areas of evidence bearing on the possibility of a single administration over major parts of Crete during parts of MMII-III may be noted. Olivier believes that the degree of uniformity in hieroglyphic inscr-iptions on seals and documents and in their use at the various sites where they appear probably denotes the existence "of a large power which extended over the whole of Crete for *at least* the last part of the protopalatial period" (1990, 18). The similarity at various sites of hieroglyphic and Linear A scripts, of seals, of religious depictions and cultic equipment, of finds at peak sanctuaries, and of the general design of at least the palaces at Knossos and Phaistos after MMIIA at the latest, together with the appearance of such specific architectural practices as the use of ashlar masonry, orthostates and masons' marks, indicate at least the existence of very close contact (Cherry 1986, 33-35), if not common direction.

Is there any direct evidence for Knossian dominance or primacy with respect to foreign trade? MacGillivray (while acknowledging the difficulty of distinguishing Knossian from Phaistian Kamares ware) believes that most of the Kamares sherds found abroad appear from illustrations to be Knossian, as in the case of the MMIIA type bridge-spouted jars and straight-sided cups found in Egypt, with their closest parallels from the Loomweight Basement/Early Olive Press and the north-west pit at Knossos, the MMII material from Ayia Irini, Phyla-kopi and Akrotiri (where the holes dug for the emplacement of the roof supports rev-ealed Kamares sherds of finest Knossian quality) and the MMIIB to IIIA wavy-line cups from Ugarit (1987, 273-279 and personal communication).[15] The black angular tempered wares so common at Phaistos, on the other hand, are seldom found abroad.[16] The occasional appearance abroad of the east Cretan variety of provincial Kam-ares ware, discussed above, may reflect the role of east Cretan ports in overseas trade.

There are also, however, some indications of contact during MMII between Malia and Egypt. The clay of a jug from Aswan resembles that of Malia Town group (though the decoration finds its closest parallel at Palaikastro) and the Minoanising pottery of Haregeh and Kahun resembles the crinkled-rimmed or lobed kantharoi from the same group (Cadogan 1983, 516), although such vessels are also found at Knossos and in the south of Crete, and all the kantharoi imitate metal prototypes with probable Anatolian origins (Davis, E.N. 1977, 89-90). The general similarity of the clay mould from Malia to the Tôd Treasure has already been noted. Lastly and more significantly, Egyptianising motifs (falcons, cats, palm trees, sphinx) appear on moulded-clay relief appliques for vases from Quartier Mu at Malia, which also produced an Egyptian stone vase (Poursat 1982, 677; 1984, 86-87). The questions of course remain whether the inspiration for the Egyptianising motifs came from the movement of Egyptian objects or Minoan artisans, and whether the contacts between Malia and Egypt indicated by the appliques and other material were direct or indirect, such as via Knossos-led gift exchange/trading ventures.

Of course the establishment of Knossian hegemony, whenever it occurred (if ever), need not have involved the direct use of force; some combination of manoeuvre and marriage, for example, might have been sufficient. Moreover, hegemony if achieved is unlikely to have been permanently maintained; rather the differing effects of war, drought, plague and malaria, the accidents of individual longevity affecting rule and succession, and the varying influence of dynastic intermarriage would probably have resulted (if the history of other civilizations is any guide) in shifting alliances and political boundaries and differing degrees of central authority over time. Complex societies throughout history have tended, in the words of Adams, to "dominate weaker neighbours, coalesce, suffer from varying forms and degrees of predation, develop and break off patterns of symbiosis -- all in dizzyingly abrupt shifts" (Adams 1974, 249).

Adams continues: "A concern for trade highlights these inter-reactions -- partly aggressive, partly symbiotic, at best only partly intelligible to the societies involved, at most times dangerously competitive" (Adams 1974, 249). While these observations were made in the context of Adams' work on trade in the ancient Near East, they appear relevant to Middle and Late Bronze Age Crete as well. Of course it is also possible that two or more palaces cooperated in major foreign ventures; the Old Testament describes a joint sea venture through the Red Sea by Solomon and Hiram, the Phoenician ruler of Tyre, to acquire luxury items such as gold, ivory,

spices and rare animals (I Kings 9, 26-28). Moreover, a Knossian hegemony need not have affected the trading relationships or activities of other palaces, any more than the creation of a Macedonian Empire in Hellenistic Greece affected the trading activities of the individual Greek poleis. But whether one, two or several palaces were primarily responsible for Minoan long-distance trade by the end of the Old Palace period, the case for a decisive palatial role in Minoan trade with the Near East and Egypt seems compelling.

A Postscript on Foreign Trade in the New Palace Period

The creation of the New Palaces has sometimes been seen as marking a change in the control of Cretan trade (for example by Branigan, who while doubting a significant palatial role in long-distance trade in the Old Palace period, accepts a directing palatial role for such trade in the neopalatial period [1982, 209; 1987, 245-249 and 333; 1989, 68; and forthcoming]).

It would appear, however, that the case for an independent maritime or merchant class with a significant role in long-distance trade actually becomes somewhat more plausible, if quite unproven, in the New Palace period. For it is with the new palaces that we find a large increase in population, particularly in settlements along the coasts, the growth of towns which in some cases surround mini-palaces, luxurious separate town houses at palatial and other sites, and fine country villas. Palaikastro, for example, with its main street running "straight and true, broad and well-surfaced, and flanked by impressive facades" (Branigan 1972, 754), could have provided homes for such merchant-mariners. The villa at Nirou Chani, a harbour on the north coast, was stacked with ritual equipment including 40-50 plastered stucco offering tables possibly destined for export, although religious use at the site or the existence there of a workshop are possible alternative explanations for so large a supply of offering tables and other ritual equipment.

Lead and stone weights are found, as Michailidou (forthcoming A and B) has observed, not only in the palaces and in houses around the palaces, but also in houses in non-palatial settlements, villas and tombs. Villas and houses at Ayia Triadha and Tylissos contained not only weights and loomweights, but also copper oxhide ingots and Linear A tablets, and both are rich in luxury products and bronze objects. It is possible, however, that by LMIB Ayia Triadha had become the administrative centre of the Mesara while Phaistos remained the religious centre, in which case the buildings in which most of the tablets and ingots were found would have been part of the palatial rather than the private sector.[17]

At Akrotiri on Thera, where the eruption preserved in one precise horizon so many of the materials of daily life, almost every house contained lead weights, but with a greater concentration in houses containing large numbers of loomweights, suggesting to Michailidou that the lead weights were used in weighing wool (Michailidou, forthcoming A and B). Seal impressions as well as weights appear in houses. The West House contained loomweights in a number to rival the Loomweight Basement at the Palace of Knossos, at least raising the question of possible private production of woollens for export. Whether the West House was indeed private is of course open to question, given the non-domestic nature of its pottery assemblage with its numbers of particular types of specialized vessels, such as incense burners on stands, together with numbers of specialized vessels from the Cyclades and mainland Greece;[18] the religious aspects of the building and its contents (N. Marinatos 1984, 34-51) and the "official" appearance of the fleet depicted on one of its walls. (A

green jasper seal found by Soles at Mochlos on the north coast of Crete in 1989 shows a ship closely resembling those in the Theran West House fresco [Soles and Davaras, forthcoming]. The case for regarding Thera at the time of the eruption in LMIA as part of a "Greater Minoa" is set forth in Wiener, forthcoming.)

Accordingly the possibility of a significant private role in long-distance trade may in fact be greater in the New Palace period than the Old, although hardly compelling in either. Indeed, it is far from clear whether the evidence for trade noted in houses at Akrotiri, Nirou Chani, Tylissos, Ayia Triadha and other places represents private ventures, or whether this activity was centrally controlled, either by regional centres or (directly or indirectly) by Knossos. At Zakros, for example, "palace" and "town" appear to function as an economic unit, with the palace shrine, storerooms and workshops containing all the luxury products and imports, including reworked Egyptian vases, ivory elephant tusks and oxhide ingots, and the town responsible for preparing and storing essential foodstuffs as indicated by the frequent appearance there of wine and olive presses (Chryssoulaki & Platon 1987, 77-84). Indeed, the town blocks on the flanking hills seem to tower over and encroach upon the palace. At the corner of the hill to the north, 50 meters from the palace and 300 meters from the sea at what may have been the landward entrance to the town, stood House A with its 525 nodules bearing 1,005 seal impressions stamped by 214 seal types, some showing contact with parchment or hides (Weingarten 1983, 38-42. Subsequent research by Weingarten may provide additions to these figures). It seems likely that House A was a control point for goods coming in and out of Zakros. It would be difficult to find at Zakros any demarcation between the domains of palace and town, public and private.[19]

While it may be true in general that "Aegean life was essentially and always concerned with agriculture and stockraising" (Warren & Hankey 1989, 4), surely the wealth of sites like Zakros and Akrotiri can only be the result of their role in a Minoan trade network, zealously maintained by the palatial rulers. The West House at Akrotiri provides, in addition to the lead weights and loomweights cited earlier, a dramatic depiction in the Miniature Fresco of fleets, armed warriors and fighting, a useful reminder that the palaces must have played a critical role in providing the infrastructure for long-distance trade in the New Palace period as in the Old. Neopalatial Crete is extremely rich in bronze, but very poor in sources of copper and of course totally lacking in sources of tin. Obtaining bronze or its constituents through long-distance trade must have been of vital interest to the New as well as the Old Palaces. In the Late as well as the Middle Minoan period, it was surely the palaces which determined, and provided, the basic structure and infrastructure of Minoan long-distance trade.

ACKNOWLEDGEMENTS

In the preparation of this paper I have received much critical advice and commentary from D. and D. Arnold, P. Betancourt, K. Branigan, S. Chryssoulaki, O. Dickinson, S. Hood, J. A. MacGillivray, J. Rutter, A. Snodgrass and V. Watrous. I have also received much helpful information and advice from D. Collon, J. Crouwel, E. Davis, J. Davis, V. Hankey, S. Iakovidis, A. Lewis, C. Lilyquist, J. and P. Muhly, T. Palaima, J. Sasson, P. Warren, J. Weinstein and J. Younger. To them I here express my heartfelt thanks.

FOOTNOTES

1. The number of bronzesmiths is surely much in excess of that required by the internal needs of the palace, and implies that the palace controlled the

distribution of bronze throughout its realm. (The role of the Cretan palaces in controlling the distribution of bronze, at least as regards weapons, is considered below and in Wiener 1987.)

2. Indeed this seems the main thrust and point of Snodgrass' argument, with which I am in full agreement.

3. For example, an Egyptian text from the time of Snefru, the first ruler of the 4th Dynasty, refers to 40 ships bringing cedars from the Levant (Schafer 1902, 30); a Hittite text speaks of 100 ships bringing grain (Heltzer 1977, 210; Klengel 1974, 171-174); a tablet found at Ugarit asked the ruler to equip an additional 150 ships (Sasson 1966, 133 cites *UT*:2062:4-5; Fensham 1967, 221 citing C. Virolleaud, *PRU*, Volume 5, 88 ff and especially lines 3-4) and Egyptian temples and tombs depict flotillas of ships, such as the Punt fleet of Hapshepsut at Deir el Bahari (Sãve-Sõderbergh 1946, 14) and the numbers of Syrian merchantmen shown on the walls of the tomb of Kenamun (Davies & Faulkner 1947, 40-46). (I am grateful to Dr. Dieter Arnold for providing the Egyptian references.)

4. Branigan 1989, 66-67 writes: "It seems unlikely therefore that Minoan commercial relations with the Aegean in the Old Palace period were controlled by the Palaces, and for the most part trading relations appear to be undirected free-lance activity"; and "There is therefore no reason to think that the palaces played any significant role in the promotion and control of trade relations with the Near East in the Old Palace period."

5. Whether there was a palace at Malia in MMII similar to those at Knossos and Phaistos is uncertain but there was at least a major MMII structure, at the site of the Late Minoan palace, as indicated by the walls obsevable under Quartier III and IV. In addition there were major administrative and cult buildings at Quartier Mu nearby (Pelon 1987b, 187-201).

6. Branigan 1987, 248, speaks of four koulouras at Knossos holding grain for 1,000 people, but the earliest of the four was probably covered over by the construction of the Theatral Area at the time the others were built in MMIIA (Evans 1935, 53 and Figure 30). I am grateful to S. Hood and J. A. MacGillivray for drawing my attention to the sequence of use of the koulouras.

7. A lead weight from Quartier Mu at Malia weighing 14.4 grams suggests the possibility that the metrological system of neopalatial Crete and the Cyclades, probably based on a unit of about 60 grams, may already have been in existence in MMII (Poursat, forthcoming), but of course not much weight should be placed on a single example.

8. This view was at one point shared by Branigan. "[T]he building of the palaces coincides with a remarkable impetus in the commercial activities of the Minoans overseas... and it is unlikely that the palatial monarches failed to foster and control this new activity. The organization and building of a fleet of ships sufficient to carry out the venture was itself a task of such magnitude that only an administration of palatial proportions could have undertaken it" (1969, 4).

9. See generally the papers in the volume, **Trade in the Ancient Near East**, edited by J. D. Hawkins, and especially the papers of P. Garelli, K. R. Veenhof, M. T. Larsen, S. Dalley, C. Zaggacnini, M. Heltzer and E. Lipinski. See also Sasson 1966.

10. Kopcke's formulation reflects the existence of highly organized states in the Near East and Egypt in the Middle and Late Bronze Age. Greek merchant mariners in the Archaic and Classical periods faced a somewhat different environment, particularly in the West.

11. Worth noting, however, is the possibility of major damage at other sites in the same general time horizon, for which there is no evidence of earthquake (Moody & Lukermann 1985, 65, 71).

12. I am greatly indebted to Dr. Stella Chryssoulaki, who has investigated these buildings, and to Prof. J. A. MacGillivray for showing me some of these structures and discussing them with me.

13. Pendlebury referred to them as forts, but preferred to think of the structures as caravanserai, noting of one, at a site called locally *stas Tavernaes*,that "it would be more in keeping with the peaceful character of Minoan civilization and with convivial Cretan habits if we could take a clue from this name and call them 'taverns' rather than 'forts'".

14. Evans believed that Knossos itself suffered a great MMIIB destruction by earthquake, but MacGillivray, who has recently restudied the pottery, would place this destruction in MMIIIA (forthcoming B).

15. At Ayia Irini on Kea in Period IV (which is largely contemporary with MMIIA, though it may begin earlier and end a little later) Minoan pottery including Knossian Kamares appears in limited quantity at first, but then increases rapidly so that by the end of Period IV Minoan pottery constitutes a

substantial proportion of the ceramic inventory. The quantity of fragments from different vases suggests that "the number of vases brought in was immense" (J. Overbeck 1989, 12).

16. An early export, the MMIB-MMIIA cup from Karmi on the northwest coast of Cyprus (Grace 1940, 10-52), is of a kind well known both from Knossos and from Phaistos and other sites in the south and a fragment of a MMIIA globular rhyton from Phylakopi has its best parallel at Phaistos (Koehl, personal communication). Scientific studies now underway may provide a means of distinguishing more readily between Knossian and Phaistian Kamares.

17. Warren's excavation on the Acropolis hill of Knossos revealed numerous fragments of Egyptian alabaster vases outside the architectural limits of the palace (this volume, above), but the significance of this material with respect to the question of private participation in neopalatial trade is unclear given the following considerations:

(1) the possible special nature of the area excavated, with its "dancing floors", (three circular structures, unique in Crete, built from reused ashlar blocks), and its North House containing children's bones which in the judgement of the excavator bear marks indicating human sacrifice and cannibalism (Wall, Musgrave & Warren 1986, 333-388).

(2) the possibility of palatial involvement with other areas where alabaster vases or vase fragments have been recovered such as the Royal Road, the Little Palace/Unexplored Mansion complex (Warren, this volume), the Warrior Graves north of the palace and Evans' "Isopata Royal Tomb" which contained 12 complete Egyptian alabaster vases, as well as two lapis lazuli Egyptian ape amulets and an Egyptian faience frog amulet (Evans 1906, 141-161; Warren 1969, 105, 112-113; Cline, forthcoming).

(3) the possibility that nearly all of the fragments are LMII and hence not indicative of the structure of Minoan neopalatial trade since, as Warren notes, the North House produced a single fragment from the LMIB destruction level, while the fragments from the area of the dancing floors came from an LMII-LMIIIA1 context, as did those from the Little Palace/Unexplored Mansion and the twelve whole vases from the Isopata Tomb.

(4) the problem inherent in estimating by extrapolation the total number of Egyptian vases reaching a site from the number of fragments found in a given area, a task which requires at the least the inclusion of data concerning areas which did not produce vase fragments as well as areas which did.

As to whether the vases arrived as a consequence of state or private activity, it is worth noting that a later Amarna tablet (EA 14 lines 34-46) reports the Pharaoh making a gift to the ruler of Babylon of over a thousand stone vases filled with five kinds of oil (Moran 1987, 99-100; Knudtzon 1915, 118). (I thank P. Warren who, with typical generosity, brought the existence of this tablet, which runs contra to his thesis, to my attention; and also D. Collon and C. Lilyquist, who provided information regarding the specific tablet.) The "Admonitions of Ipuwer" (Papyrus Leiden 344, Recto), an Egyptian text of uncertain date, contains a phrase which has been translated "nobles are embalmed with their oil as far as Crete" (Lichtheim 1976, 152).

18. I thank P. Betancourt for bringing the nature of the pottery assemblage to my attention.

19. Textual evidence listing large quantities of foodstuffs found together with agricultural implements and large pithoi (Palaima 1990, 95 and Notes 42-43) may require a reconsideration of the doubts expressed in Warren 1985, 101, and Wiener 1987, 265, concerning the adequacy of the hinterland at Zakros to provide a sufficient agricultural surplus to support a major independent palace.

CHAPTER 1

Tyre before Tyre: The Early Bronze Age Foundation

María Eugenia Aubet

I would like to express herewith my friendship as well as my personal and scientific admiration for Michal Artzy.

1 The Origins of the Settlement in the Archaeological Record

1.1 *Introduction*

Until 2010 the Tyre Project had focused exclusively on the excavation of the Iron Age Phoenician necropolis at al-Bass (Aubet 2010; Aubet, Núñez, and Trellisó 2014, 2016). In 2014, the Direction Générale des Antiquités du Liban (DGA) charged us with opening a new excavation area in the central part of the ancient island (Fig. 1.1a), with the goal of exposing a significant segment of the Phoenician city.[1]

Within the boundaries of Tyre's archaeological park, located in the middle of the ancient island, the density of monumental remains from Ottoman,

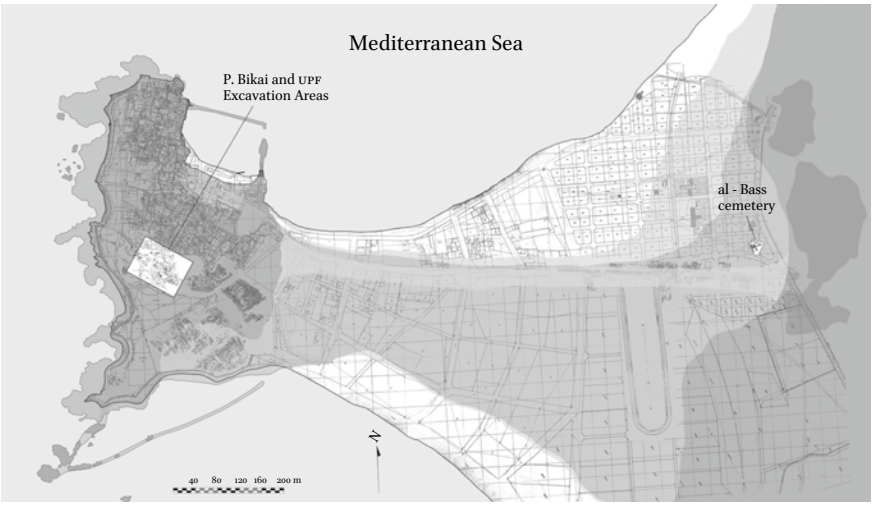

FIGURE 1.1A Map of Tyre with location of the excavation areas

1 The excavations were directed by Francisco J. Núñez, Ali Badawi, and the present author.

medieval, Byzantine, Roman, and Hellenistic times make it extraordinarily difficult to access the pre-Roman occupational strata. For this reason, in 2014 we decided to open a large excavation area of 30 × 10 m (Area A) (Figs. 1.1b and 1.2) in the vicinity of the deep sounding that Patricia Bikai made in 1973–1974, adjacent to a modern road that rings the island. Area A was situated in one of the few places where the archaeological remains uncovered by Bikai all but guaranteed the presence of Iron Age occupational levels close to the surface. We followed the same north–south oriented grid used during the 1973–1974 excavations and, although the density of structures from various periods made it difficult to identify the exact location of the earlier excavations, the area we selected turned out to be close to the mark. During the 2016 campaign, upon enlarging Area A to the north into Areas 1–4, we encountered an area briefly excavated by Maurice Chéhab, in which the original 4 × 4 m squares grid system was still visible (Figs. 1.1b and 1.2).

The 2014 excavations in Area A were located in one of the central and most elevated parts of the ancient island—at 5.92 m above sea level—which we called the Acropolis. Area A is also about 100 m to the west of the medieval enclosure of the Crusader Cathedral. Among the structures identified in 2014, of particular interest were the remains of an Ottoman house (still inhabited in the eighteenth and nineteenth centuries) and a partly-preserved monumental ashlar structure of Persian or Hellenistic date.

1.2 *Chéhab's Sounding* (*Area 1*)

During the months of May and June in 2014, the limits of Area A were expanded to the north of the Ottoman structure mentioned above, in keeping with the goal of obtaining wide exposure. Upon clearing away the brush from the area, however, we found the remains of a large stratigraphic sounding measuring 8 × 8 m, which is not mentioned in the literature (Fig. 1.2: Chéhab's sounding). Signs of it can be seen in aerial photographs taken in the 1960s by Emir Maurice Chéhab (Jidejian 1969; Chéhab 1972), indicating that the sounding was carried out before Bikai's excavations. Some witnesses suggest the possibility

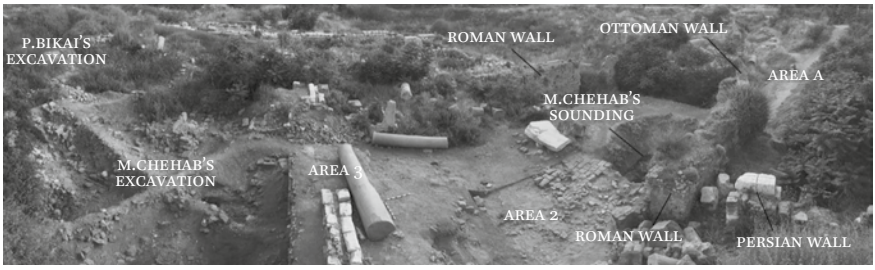

FIGURE 1.1B The excavation areas in 2014–2016

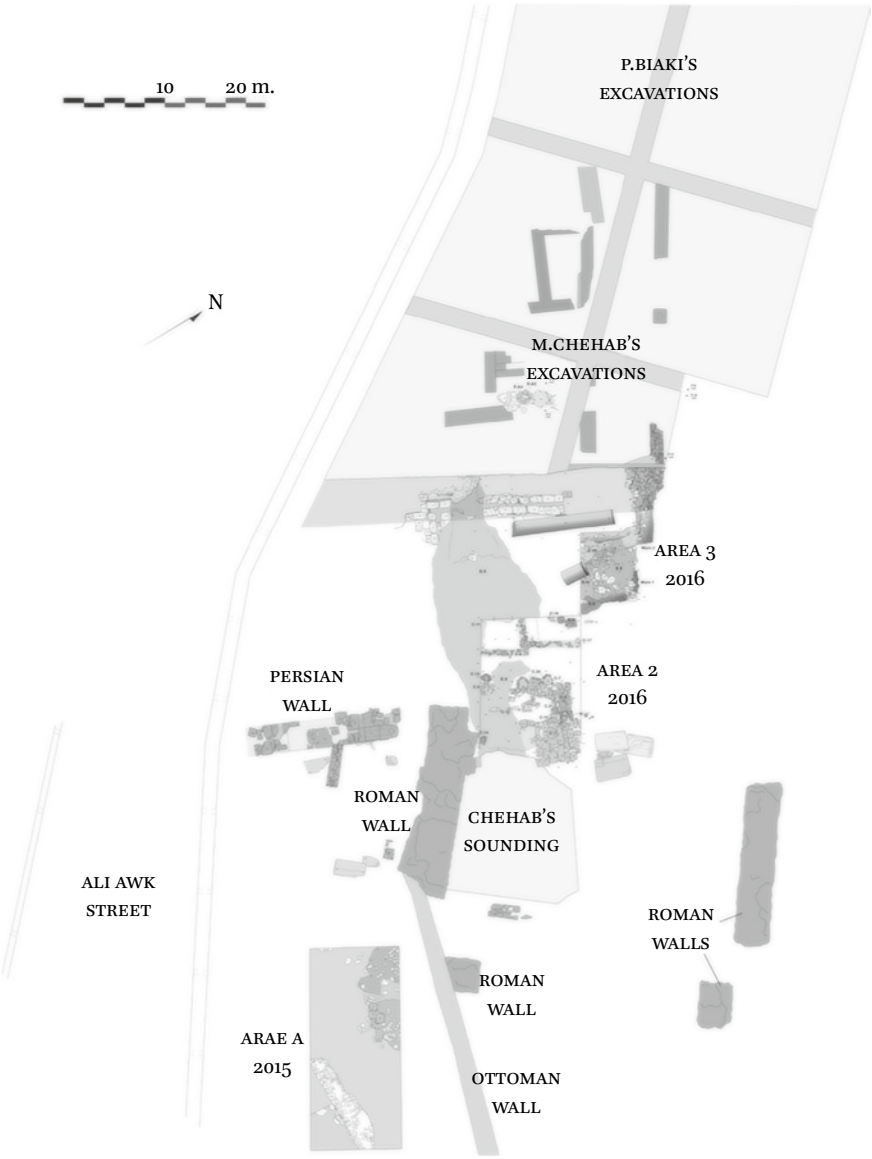

FIGURE 1.2 Plan of the excavation areas in 2014–2016

that this sounding was made in 1967–68 by Chéhab himself or by Michel Chami, Chéhab's assistant at the DGA. Either way, it is clear that the findings from this sounding served as a reference when, in 1972, Chéhab entrusted Bikai with the nearby excavations.

Despite the fact that the sounding was very poorly preserved and obstructed by collapses and recent disturbances—it had served as a dump and weapons cache during the civil war (1975–1990)—it was possible to reconstruct its outer limits and original north–south orientation. Given the sounding's characteristics, which clearly indicate the supervision of a professional archaeologist, it seemed judicious, in the context of our first campaign of excavations on the island, to obtain a partial record of the sounding's stratigraphic sequence from the surface (4.98 m above sea level), taking advantage of the window opened by a preceding excavation.[2]

A careful cleaning of the sounding's western section revealed interesting vertical stratigraphy, some 3.23 m high, which spans occupational layers dating from the origins of the city all the way to the late Iron Age (Fig. 1.3). In other words, the western section of the Chéhab sounding reveals the complete stratigraphy for pre-classical Tyre. A small quantity of ceramic and organic

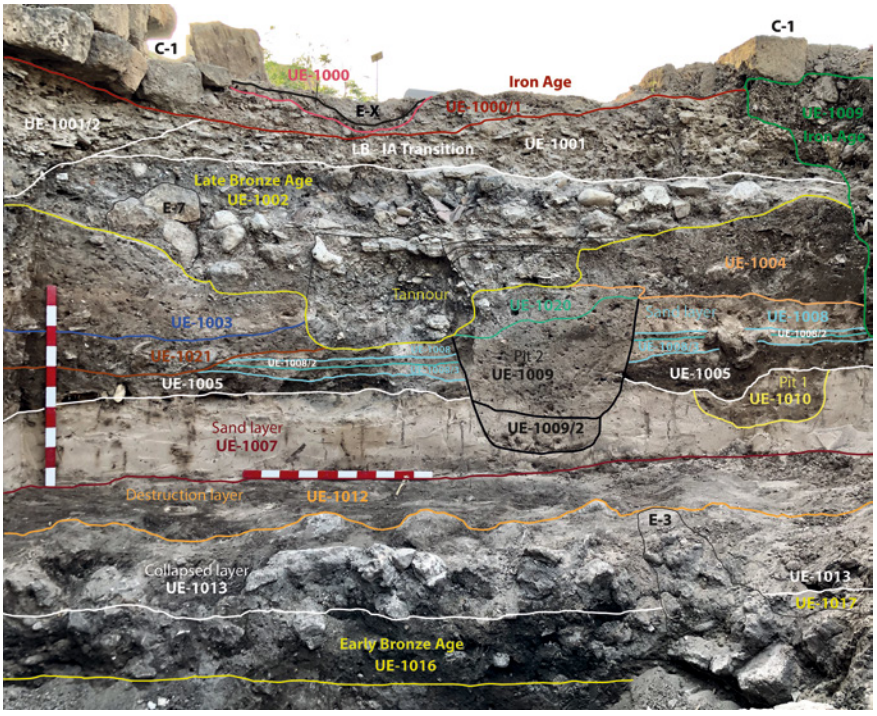

FIGURE 1.3 Chéhab's sounding, 2014; western section

2 The team members in the 2014 season were Antonio Esteban, Michal Krueger, Isabel Muntalt, Mohamed El Mhassani, Barbara Mura, and Ida Oggiano.

samples was collected from each stratum during cleaning, revealing a very complex occupational sequence. The following comments focus exclusively on the deepest levels of the old sounding from the 1960s and on a preliminary interpretation of the finds mentioned above. These observations are limited, of course, by the fact that they are based on a small archaeological sample that was not obtained through systematic excavation.

Overall, the structure and features of Chéhab's sounding provide yet another confirmation of the rigor and clarity of Bikai's assessment of Tyre's stratigraphy.

1.3 *The First Tyre*

Given the limitations of space and the risk of collapse, the cleaning of the sounding's section did not proceed all the way to bedrock, although it did reach a depth of 1.75 m above sea level. The deepest stratum exposed, about half a meter in thickness, contained abundant ashes, charcoal bits, and large, loose stones, in addition to a fine layer of sand. These features suggest an identification as Bikai's Stratum XX (1978: 6–7), which is a destruction horizon following the important occupational horizon of Stratum XXI. Over this lay a thicker layer (0.5–0.7 m) consisting of a collapse of large stones, wall fragments, ashes, and charcoal, which yielded comb-incised ware as well as abundant stone tools (Fig. 1.4). Given the morphology of the artifacts and the features of the layer itself, this level can be confidently identified as Bikai's Stratum XIX.

Immediately above these alternating unequal early layers attesting human frequentation, destruction, and abandonment, there is a substantial accumulation of sterile sand of eolic origin nearly 1 m thick—spanning 3.39 to 2.63 m above sea level (= Bikai's Stratum XVIII). It corresponds to an extended period of abandonment of the island, which appears to span the totality of the Middle Bronze Age (ca. 2000–1600 BCE). Over this we find the first Late Bronze Age levels (Strata XVII–XVI), which represent the first permanent settlement of the island (Bikai 1978: 64–65).

The lowest levels identified in the western section of Chéhab's sounding thus correspond to Strata XX and XIX in the 1973–1974 sequence, dated to the Early Bronze Age IV (ca. 2500–2000 BCE) (Bikai 1978: 6–7). These deposits are significant because the same levels were discovered also in the 1970s excavations, lying over a considerable ash destruction layer (Strata XXII–XXI), some 0.15 m thick, which sealed the remains of a large rectangular structure, of which one corner was exposed (Fig. 1.4). This structure was built very close to bedrock on the highest point of the reef, and was found to have thick stone walls nearly 1 m wide, a plaster floor, and, as in Byblos, stone pillar bases presumably meant to support wooden columns. Bikai estimated that this exceptional building,

FIGURE 1.4 Early Bronze Age building, 1973–1974
PHOTO COURTESY OF P.M. BIKAI

which she dated to the end of the Early Bronze Age III, a little before the mid-third millennium BCE, might have reached a length of 15 m (Bikai 1978: 5; 1992: 67; Bikai and Bikai 1987: 74–75).

Based on stratigraphic and architectural evidence, Bikai subdivided the Early Bronze Age strata in Tyre into three subphases: (a) a first occupational phase just above bedrock (Strata XXVII–XXIII); (b) the aforementioned structure (Strata XXII–XXI); and (c) a period following the abandonment of the structure (Strata XX–XIX). Following this, the second major period at the site is the occupational break attested by the sterile sand layer of Stratum XVIII (Middle Bronze Age) (Bikai 1978: 14).

Clearly, our section in Chéhab's sounding only reaches the third subphase of the Early Bronze Age, in which the large Strata XXII–XXI building was abandoned, as well as the upper part of the levels associated with the structure's construction.

As expected from a superficial section cleaning, the archaeological materials collected were not abundant, although they are significant. Among the finds, the lithic finds stand out—including a number of very fine blanks and a flint core (Fig. 1.5e)—as do bowls (Fig. 1.5d), juglets and a stone vessel of Egyptian origin (Fig. 1.5c). Of chronological relevance are large two-handled jars with combed incised decoration (Fig. 1.5a, b), typical of Tyre's Strata

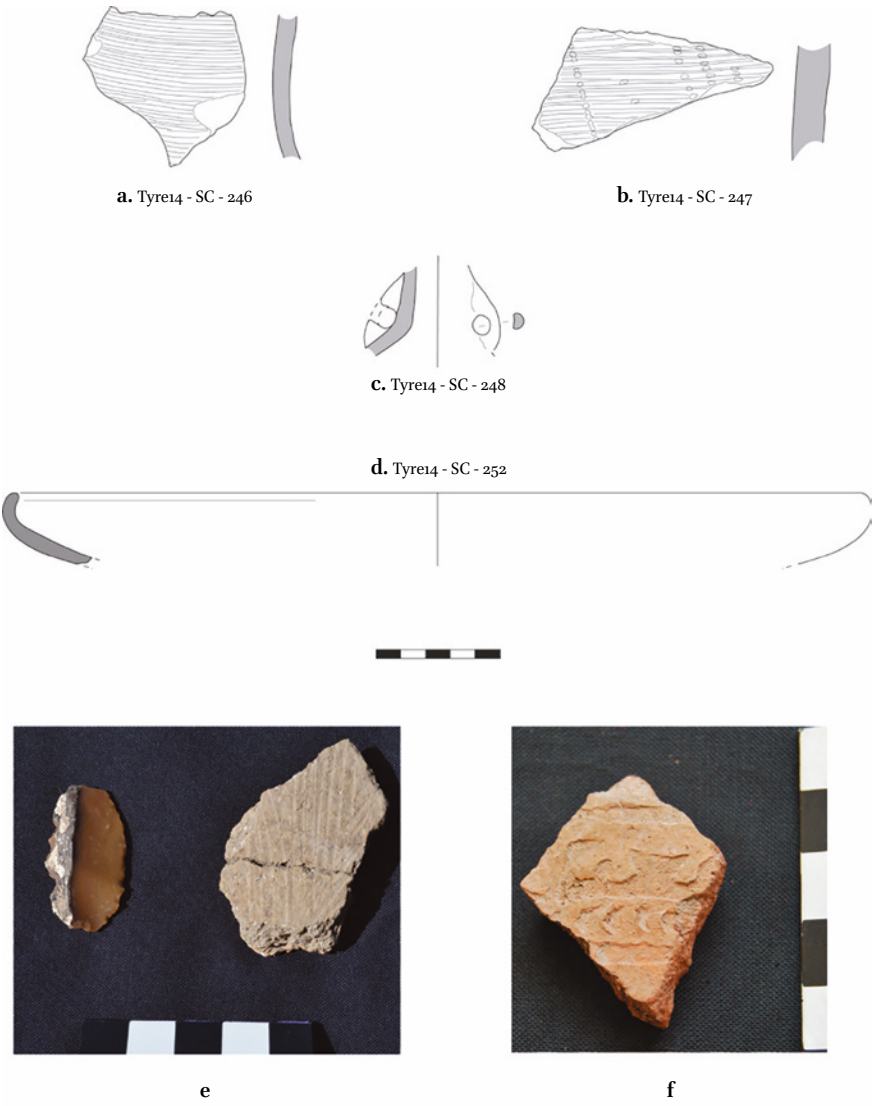

FIGURE 1.5 Early Bronze Age pottery and flint from the 2014 excavations

XXVII–XXI (Bikai 1978: 69, pls. LVI.22, LVII.69), and also attested at Sidon (Doumet-Serhal 2006a: 40–41; 2006b: 10, pl. 14) and in Levels 17–16 at Tell Arqa ("céramique peignée"), belonging to the late EB III (Phase R) and EB IV (Phase P), c. 2700–2000 BCE (Thalmann 2006: 17–28, pl. 46, 50–53). At Tell Arqa this pottery style is found in association with a lithic assemblage very similar to ours. In general, the combed wares at Tyre are slightly later than those at

Byblos or Tell Arqa, where they are especially abundant in the earliest Level 17 (2700–2500/2450 cal BCE).

One exceptional find associated with these materials is a sherd with a partially preserved impressed frieze featuring an animal, probably a lion (Fig. 1.5f). The piece belongs to a category of vessels characteristic of the EB III and IV, called cylinder-seal-impressed ware and represented, for example, by large jars in the Early Bronze levels at Ebla (Palace G), Hama, Tell Fadous-Kfarabida, and Sidon (Genz 2014: 300, fig. 21.4; 2015: 102, fig. 9; 2017: 77, fig. 4.3; Doumet-Serhal 2006a: 259–270). In large urban centers of this period, this ware appears associated with public structures or administrative activities, like commercial transactions and record keeping.

The first human occupation on the island of Tyre occurred during a period in which urban centers with public structures and fortifications were thriving on the northern Lebanese coast at Tell Arqa, Byblos, and Tell Fadous-Kfarabida (Dunand 1952; Saghieh 1983; Thalmann 2006; Genz 2014). In contrast to these centers on the northern coast, however, the Early Bronze Age has usually been understood to be a period of marked decline on the southern coast, a process reaching its peak with the occupational break at Tyre during the Middle Bronze Age. Compared with the great northern centers, understood to be incipient territorial states, the only EB IV site known in the south—the island of Tyre—would constitute little more than an "ephemeral campsite" (Genz 2015: 105; 2017: 76).

The great building of Strata XXII–XXI, dating to the mid-third millennium at Tyre, however, suggests a deliberate choice toward permanence on a small rocky islet, probably related to the construction of a temple—what we might understand as a symbolic appropriation of coastal reefs to serve as an outpost for a nearby center on the mainland. The discovery of cylinder-seal-impressed pottery implies that a range of commercial and administrative activities was taking place in the vicinity of the Tyre stone structure, since this ceramic style is associated with similar activities and notably with the use of weight systems in the northern urban centers. The discovery in 1973–1974 of an Early Dynastic Egyptian inscribed quartz cylinder seal in Stratum XIX (Ward 1978: 84) carries with it the additional implication of incipient interregional trade. The number of combed sherds—some handmade—related to large storage jars also suggests transport and trade activities in this period.

It is reasonable to assume that the population that first occupied the Tyre reef came from the nearby mainland. In my opinion, there is only one possible candidate: given its characteristics, the amplitude of its stratified deposits, and its location in a fertile plain, all signs point to the tell at Al Rashidiyeh, located on the coast just 4 km southeast of the island of Tyre, close to the important

freshwater springs at Ras el-ʿAyn. It has not yet been possible to carry out excavations on Tell Al Rashidiya, due to the presence of a dense Palestinian refugee camp at the site; however, future research at this site may well yield surprises, especially as concerns the periodization of the Bronze Age on the southern Lebanese coast.

Without more details concerning this coastal tell, situated in an area bearing evidence of human occupation stretching back to the Neolithic, it is premature to speak of periods of decline, occupation, and abandonment on the southern Lebanese coast, based exclusively on the stratigraphy at Tyre, which was a settlement of little relevance before the Late Bronze and Iron Ages. We are informed about this by a reference to a "ruler (king) of Tyre" in an Egyptian Execration Text (ca. 1880 BCE), during the Middle Bronze Age, when the island of Tyre was deserted (Katzenstein 1973: 19; cf. Bikai 1978: 72). It seems clear that the Egyptian text is referring to a different Tyre, the "continental" one.

Later documentary sources also refer to this continental Tyre, calling it *Ushu*. In the Amarna period (fourteenth century BCE), Ushu supplied water to the island, was a faithful ally to Egypt, and was the capital of a monarchy. Much later, the Assyrian Annals mention that Ushu was the bridgehead for the assault on the island, and in the time of Alexander the Great, it was still the site of an old temple to the god Melqart (Katzenstein 1973: 14, 29). The classical geographers knew Ushu by the names *Palaityros* or *Palaetyros* (Old Tyre)—a late appellation that is first attested in Strabo (16.224)—as well as *Tirus vetus* (Just. *Epit.* 11.10–11).

1.4 *Tyre, "The Rock"*

As a whole, the remains discovered in 2014 and especially those from 1973–1974 reveal that the island of Tyre was occupied for the first time around 2700 BCE by small groups from the mainland, perhaps fishermen. Rather than "occupation," perhaps it would be more accurate to speak of the occasional or seasonal presence on the reef of a community otherwise residing at a nearby mainland center.

The reef could not have been very attractive for its first occupants. It was probably made up of two parallel sandstone islets, the largest of which did not rise much higher than 1 m above sea level (Fig. 1.6), offering only minimal space poorly suited to the establishment of a long-term settlement.[3] The original name of the islet was *Ṣur*, meaning "rock" or "outcrop"—a name that the city

3 Recent geophysical research suggests that from 6000 to 4000 BCE, that is, during the Neolithic and Chalcolithic periods, sea level was lower than it is currently, such that the exposed

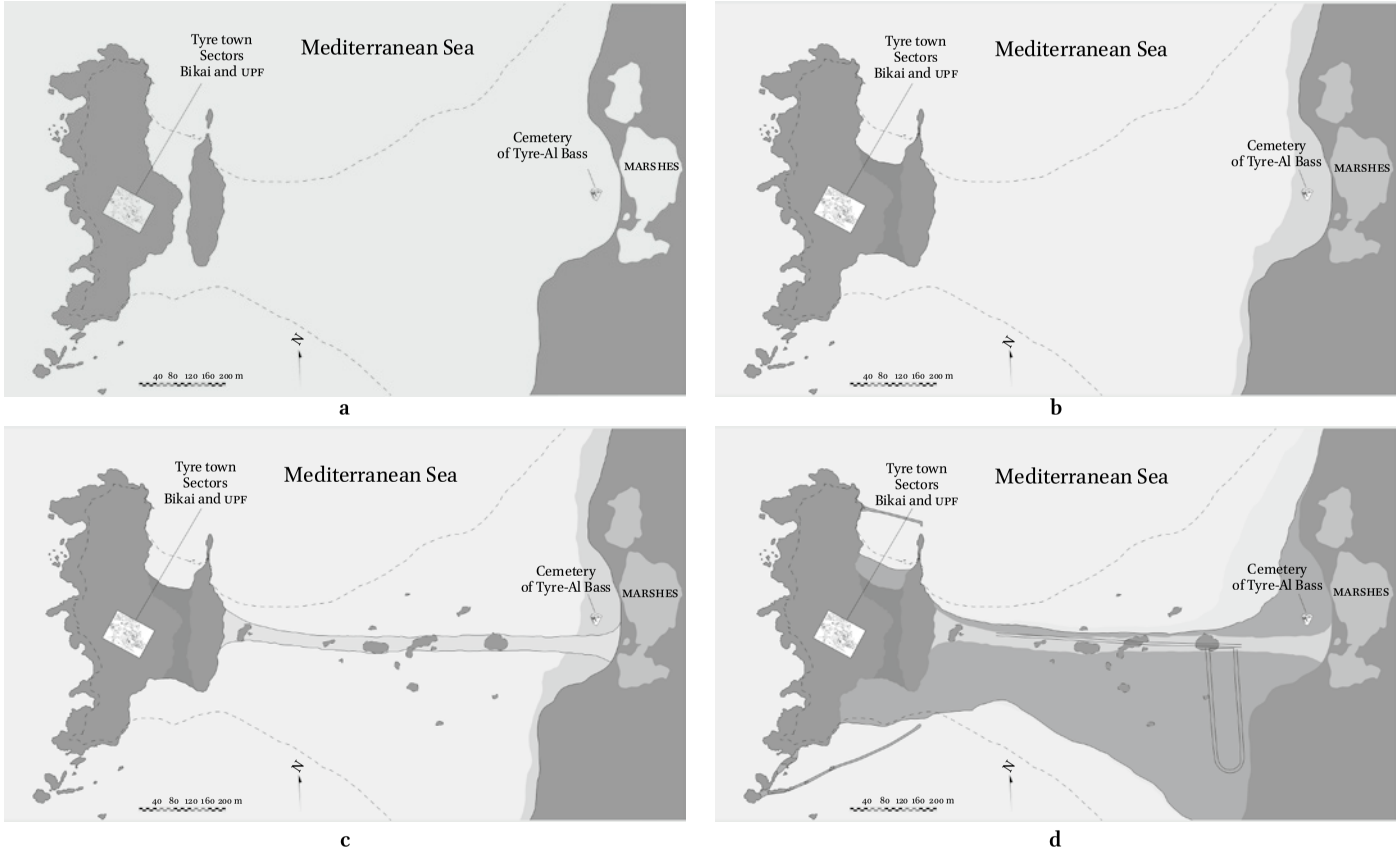

FIGURE 1.6 Reconstruction of the evolution of Tyre
BASED ON P.M. BIKAI 1992

has kept to this day, and from which the Greek transcription *Tyros* derives (Katzenstein 1973: 9).

The first evidence for deliberate, permanent occupation on the islet—a proper "foundation"—is the construction of the large structure of Strata XXII–XXI, ca. 2700/2500 BCE, which was set on one of the highest points of the reef, at a short distance to the west of the Crusader Cathedral (Bikai 1992: 74–75, pl. 13).

It is nevertheless surprising to read Herodotus's famous passage (Hdt. 2.44) describing his visit to insular Tyre in the mid-fifth century BCE in order to learn more about its famous sanctuary to Herakles (= Melqart). Herodotus describes the sanctuary and its famous stelae and, speaking with the temple's priests, the Greek historian asks them how much time has passed since the temple's foundation. The priests tell their visitor that the god's sanctuary was founded at the same time as Tyre itself, 2300 years ago (Katzenstein 1973: 18; Bikai 1978: 72; Bondì 1990: 258). Herodotus's reckoning, which was probably based on the temple's archives, yields a date of roughly 2750 BCE for Tyre's first "foundation." This reckoning is in broad agreement with the chronology attributed to the Early Bronze Age materials described above.

There are hardly any descriptions of "The Rock" before the Iron Age. The most famous account refers to Hiram I of Tyre, who, according to a local tradition reported by Flavius Josephus (*Ap.* 1.113), united the two reef islands in the tenth century BCE in order to found a new capital. In the tenth and ninth centuries, the city is already represented with impressive walls in the bronze gates of Balawat, and referred to as "the fortress" (2 Samuel 24:6–7). In the early sixth century BCE, Tyre is described as being "in the midst of the sea" (Ezekiel 27:32). But that is a later Tyre, the capital of a powerful kingdom and the metropolis of a colonial-commercial diaspora that sent its citizens and merchants across the Mediterranean and to the Atlantic. As has happened many times with other great metropoleis, like Rome, there is a temptation to judge Tyre's early days and prehistory in light of its future greatness. Before the Iron Age, the island of Tyre would have been a mere extension of the continental Tyre, Ushu. In the Middle and Late Bronze Ages, when the contemporary written sources do mention Tyre, they are referring above all to the city of Ushu, not to the island.

Thus, while the Early Bronze Age marks the foundation of Tyre's first insular settlement, the second and more definitive foundation belongs to King Hiram I in the tenth century BCE, this time the result of an explicitly political decision marking the creation of a great capital.

---

area of the Tyrian reef may have been considerably greater (Marriner 2008: 68–99; Marriner, Morhange, and Carayon 2008).

2 The Legends about Tyre's Origins

A discussion of the earliest Tyre attested archeologically is also an opportunity to review the textual data at hand regarding the site's beginnings. In the absence of direct written sources relating to Tyre's history, which are now lost, we are left with the translations of Phoenician works—for example, those of Menander of Ephesus (via Flavius Josephus) and Sanchuniathon (via Philo of Byblos)—as well as with various, often quite late, pseudo-historical sources that tend to conflate myth and real history.

As a starting point, a noteworthy source is the work of Flavius Josephus (37–100 CE), who states in *Contra Apionem* (1.107) and *Antiquitates Judaicae* (8.55) that he transcribed entire passages from the Hellenistic writers Menander of Ephesus (*The History of Tyre*, third–second centuries BCE) and Dius (*The History of the Phoenicians*), a Hellenistic historian cited by Josephus (*Ap*. 1.116). These, in turn, claimed to have translated into Greek the *Annals of Tyre* that were kept among the city's archives and official records (Katzenstein 1973: 77–79).

Josephus says (*Ap.* 1.113) that Tyre was originally formed from two islands, one larger than the other, and that in the tenth century BCE, King Hiram I united them in order to increase the city's size and erect the capital's primary public and religious structures.

Another description of Tyre's origins is related by Philo of Byblos, a grammarian from the time of Nero and the author of an eight-volume *Phoenician History*, part of which was transcribed in Eusebius of Caesarea's *Praeparatio evangelica* (1.10.9–11) in the third–fourth centuries CE. Philo's work was, in turn, a translation into Greek of the writings of a certain Sanchuniathon, who claimed to have lived at the time of the Trojan War. Philo prided himself in recovering ancient Phoenician traditions, and interpreted myths as memories of ancient events that actually occurred (Attridge and Oden 1981: 43; Baumgarten 1981: 159–165; Ribichini 1985: 20–22). According to this legend, Tyre's origins are connected with two rival, founding brothers: Samemrumos, also called Hypsuranios, and Ousoos. Hypsuranios lived in Tyre and clashed with his brother Ousoos, the first human sailor. One day, as a storm hit the coast and started forest fires near Tyre, Ousoos, a great hunter who wore animal skins, built a canoe and set out to sea. Then he consecrated two stelae to the fire and the wind—the divine forces that had helped him—founded the city, and offered sacrifices to these stelae in the form of blood libations from the animals he had hunted. For the first time the symbol of the two stelae or columns appears connected to a foundation myth, an allegory of the "twin cities"—the insular and continental Tyre (Ousoos, Usoos = Ushu?)—which is also communicated

through the two eponymous heroes or mythical ancestors (Grotanelli 1972: 52–53).

Classical mythology preserves another foundation myth, although this time we are dealing with very late sources. In this one, Tyre was founded on two rocks connected by the roots of a sacred olive tree (Nonnus, *Dion.* 40.468). The *Dionysiaca* is a text in verse by Nonnus of Panopolis, written in the fifth century CE, which describes the visit of Dionysus or Bacchus to the city of Tyre (*Dion.* 40.300–500). Fascinated as he beholds the temple of Herakles Astrochiton, he pays homage to the Tyrian god, who then invites Dionysus to his table, where they share a banquet of ambrosia—the elixir of immortality and drink of the gods—nectar, and wine (line 420). Later Dionysus asks Herakles about the origin of the city and who set the "rocks" in the sea. Herakles tells him that he himself did, using an oracle of dreams to instruct the first inhabitants of the region—the first men on earth or "sons of the earth"—in the art of navigation, of shipbuilding, and to set out at sea until they reached the appointed location. There they found two rocks drifting in the sea—the floating islands—that were named "Ambrosians" or immortals (lines 467–469). Herakles proceeds with the description: On one of these rocks a sacred olive tree was growing, as old as the islands themselves, permanently enveloped in flames without burning up. On the tree were a bird and a cup, and a snake was wrapped around its trunk. The men who were sent to the island had to capture the eagle and sacrifice it to Zeus, making a libation of its blood, which they were to pour over the Ambrosian Rocks in order to cement them together, fix them to the ocean floor, and found the two islands (lines 499–505). The eagle offered itself as a sacrifice, and, through this self-immolation and the blood sacrifice, the islands stopped wandering. Then the god ordered the construction of the city "by the sea of Tyre." "The place of the eagle sacrifice indicates where Tyre should be founded and the image of the island that emerges from the sea from two wandering rocks will remain as a metaphor for creation, the sacred birth, and the etymology of the original Phoenician name of the city" (Katzenstein 1973: 9; see Naster 1986: 361–363). Throughout this story, the protagonist is clearly Herakles-Melqart, the principal god of Tyre—the *Baal Ṣur*, "Lord of Tyre"—who, in turn, would also immolate himself in fire in order to achieve immortality.[4]

It is difficult to date the origin of these legends, which seem to have been set down in writing quite late, since they do not appear before the fourth or fifth

4 The bibliography on Melqart and his Greek and Latin equivalents (Herakles and Hercules) is infinite, particularly regarding foundation myths and the well-known sanctuaries in Tyre and Gadir.

century CE.[5] The two versions of the myth, the one of Philo of Byblos and the one of Nonnus, contain early features that are clearly oriental and probably emerged from the same original tradition. Indeed, despite their differences, the myths encapsulate a number of common elements: the flaming olive tree, the blood sacrifice, the two rocks, the close relationship between the fire and the olive tree, etc.[6]

Earlier, in the third century CE, the legends passed on by Nonnus and Philo of Byblos had enjoyed tremendous popularity in the city of Tyre. Indeed, the motif of the Ambrosian Rocks and the flaming olive tree appear on bronze coins from the Tyrian mint even before they show up in Nonnus's erudite writings. Between the reigns of Elagabalus (218–222) and Gallienus (253–268) the Ambrosian Rocks appear on Tyrian coins accompanied by the Greek or Latin legend AMBROSIE PETRE or PETRAI (Cook 1940: 975–1015; Naster 1986: 364–368; Bijovsky 2005). The rocks are depicted as round objects on a joint pedestal, flanking a flaming olive tree (Fig. 1.7) and are sometimes accompanied by other motifs connected to Tyrian legends, such as the dog and the murex. Indeed, alongside the symbols explicitly related to the foundation myths, other legendary Tyrian figures are common on Roman coins from Tyre—the hero Cadmus, the bull representing Zeus in the myth of the abduction of

FIGURE 1.7
Bronze coin of Elagabalus (218–222 CE)
PHOTO COURTESY OF G. BIJOVSKY

5 Another author from this period, Achilles Tatius (fourth century CE), alludes to the same symbols: in his *Leucippe and Clitophon* (2.14), Tatius mentions the sacred precinct of Herakles in Tyre, where there was a burning olive tree.

6 Evidence dating to the beginning of the Roman Empire gives us an even earlier attestation of the myth. A small limestone relief, found in Tyre and now housed at the Museum of the American University of Beirut, depicts a strange scene, featuring a large tree with burning branches, an eagle sitting on it, a serpent wrapped around its trunk, and a deer (Will 1950–1951; Zanovello 1981). The Beirut relief is presently the earliest known representation of the legend about Tyre's origins.

Europa, the eagle, the murex, dolphins, Herakles-Melqart, Pygmalion, the two stelae, the palm tree, and a flaming altar. On the coins of Gordian III (238–244) there also appear two brief legends in Phoenician script (*lṣr*, "of Tyre") (Naster 1986: 364; Bijovsky 2000: 326).

Of course, there is some confusion surrounding the symbolic significance of these Tyrian coinages and regarding the possibility that the Ambrosian Rocks depicted on them represent the two islands, mountains, stelae, betyls, or even the famous Pillars of Herakles (Bijovsky 2005: 831; Butcher 2016: 236).

Whatever the case, in my opinion, the crucial question is not whether the iconography of the coins or the late texts of Philo of Byblos, Nonnus, or Achilles Tatius demonstrate the persistence into Roman times of a remote and ancient myth—one whose origin cannot even be dated today. Rather, the question is why such a remote past is being invoked—and with it the ancient Tyrian heritage, its foundation myths, and its heroes—in coinages and erudite texts within the heavily Hellenized context of the Eastern Roman Empire, in a sort of "renaissance" of early Tyrian heritage, a glorification of the past, with the goal of underscoring the unique nature of the cults and traditions of Roman Tyre (Bijovsky 2000: 326; Butcher 2016: 236, 252). The idea of using the remote, albeit reinvented, past as a means of promoting present greatness would seem to be typical of the elite culture of the second–third-centuries Eastern Roman Empire, which would have found in the supposed, or probable, antiquity of its foundational myths a measure of legitimacy for its political ambitions.

Thus, there were several versions of a legend surrounding the origins of Tyre, which was deformed and adapted to suit to present interests and circumstances. Poets and thinkers told myths designed to create a unifying referent that would cement the community around the idea that the foundation of a city is always a unique event, auspiciously ordained by the gods. Out of all these legends, collective memory latched onto the image of two islands, the flaming olive tree, and the "king of the city" in the divine origins of Tyre.

Acknowledgments

I would like to thank Patricia Bikai for her goodwill and collaboration throughout all our years working in Tyre, since the late 1990s. Likewise, I am grateful to her for the authorization to reproduce images from her excavations. Moreover, I would like to express my thanks to the various colleagues who have contributed their advice and assistance to the production of this article: Manuel Alvarez, Ali Badawi, Amelie Beyhum, Gabriela Bijovsky, Philip Johnston, Francisco Núñez and José M. López-Garí.

CHAPTER 14

Lévi-Strauss and the Royal Ancestor Cult in the Bronze Age Levant

Marisa Ruiz-Gálvez

Michal Artzy is, for me, one of most admired Ladies of Mediterranean Archaeology. I am in wonderment of her brilliant ideas, her ability to join the pieces of the archeological record, to offer an appealing, well-formed interpretation, and her gift of captivating her audience and readers; but especially enviable are her energy and vibrant character. I hope that my contribution does justice to her merits.

1 Introduction

In one of the two essays comprising his book *The Way of the Masks*, C. Lévi-Strauss developed a model of a cognatic, bilateral kinship that he called *société á Maison*, "House society," following a formula adopted from medieval Europe. Lévi-Strauss considered the "House" a general kinship category, defining it as follows:

> "A moral person, holder of a property, made at the same time of material and immaterial goods, which is perpetuated by the transmission of its name, its fortune and titles through a lineage, either real or fictional, considered legitimate, on condition that such continuity could be" expressed either in the language of kinship or of the alliance, or in both.
>
> LÉVI-STRAUSS 1981: 150

The House society model was first applied in the 1990s to the Maya social organization to explain the evolution from weak to strong states (Gillespie 2000; Joyce 2000). Since then, the model has been used to define seemingly very different societies as the Kwakiult and Yurok (Lévi-Strauss 1981), the Early Bronze Age Levantine societies (Chesson 2003), the Minoans (Driessen 2010, 2012), and the late Iron Age Gallaecians (González-Ruibal 2006). More recently, this model was also employed for defining societies of the Bronze and Iron Age

© KONINKLIJKE BRILL NV, LEIDEN, 2020 | DOI:10.1163/9789004430112_016

Levant, as well as Mycenaean, Villanovan, Etruscans, and Nuragic societies (González and Ruiz-Gálvez 2016).

The application of the House society model to seemingly diverse social groups is possible due to the flexibility of the "House," as it uses many different strategies to recruit its members, and because these strategies can be deployed as much by the common people as by the elite (Gillespie 2007: 38). Also, as the House is a highly competitive system, the model helps to explain dynamics of emergence and collapse of sociopolitical entities, as it is the House, and not its members, that has rights and duties (Lévi-Strauss 1981). Thus, we recently defined House societies as heterarchical systems, more complex than chiefdoms, but where power is still performed in a corporate way, where the ruler is only a *primus inter pares* as the assemblies of elders or high-ranking families constrain his power (González-Ruibal and Ruiz-Gálvez 2016).

As Lévi-Strauss (1981) pointed out when examining the Kwakiult and Yurok kinship systems, House societies are neither patrilineal nor matrilineal, but cognatic or bilateral, as both the father's and the mother's patrilineages are equally relevant, since rights to the House's name and property could be transferred through both lineages.

House societies emerge in complex agricultural systems (i.e., irrigation, plow agriculture, or specialized herding), where available soil is scarce and/or population densities, high, so that land control and land ownership become critical. In that sense, House societies comply with Goody's (1976) model of complex agrarian systems connected with the dowry institution and with monogamous and endogamous marriage. As Goody explains, complex agricultural systems allow the concentration of the best soils in few hands. Since irrigation, plow agriculture, and specialized herding all relied on male labor, estate and property are transmitted through the patrilineage, while women from wealthy families are dowered and used as pawns in a strategy of homogamous or hypergamous marriages geared toward the preservation and enlargement of the House's patrimony. This is due to the fact that, although women did not inherit property, they did transmit property rights to their offspring in the absence of a male heir in the family. In this way, Ávalos (1995: 619, 626) cites Numbers 27:1–11, where Yahweh orders Moses to allow females to inherit in absence of males and, though infrequent, there are references in the Bible to the *bet 'em*, "House of the mother" (Genesis 24:28). Institutions as the dowry, levirate, sororate, birthright, and forced bachelorhood of the junior sons as well as of those daughters who cannot be dowered, so that the inheritance is not split up, are all characteristics of these systems (Goody 1976). As these institutions are intended to enlarge and improve the patrimony and prestige of the House,

rather to than to enrich the head of the household (or less so), the system described by Goody corresponds to Lévi-Strauss's house society.

Following Lévi-Strauss, many scholars outlined the physical features that define a kinship group as a House society (Macdonald 1987; Carsten and Hugh-Jones 1995; Joyce and Gillespie 2000; Beck 2007).

The Houses are economic and social entities within which there is unequal access to property and prestige, and whose wealth and perdurability is conveyed through their elaborate architecture, as much as in the use of emblems, or through the song or recitation of their myths and exploits (Lévi-Strauss 1981: 152; González-Ruibal 2006: 163).

The agglomerated pattern of urbanism, shaping whole neighborhoods, has also been pointed out as the expression of corporate structures, where lesser members and affines group around the main House (Schloen 2001: 150–151, 302; Chesson 2003: 90–94; Driessen 2010: 50–57), as seen in the third-millennium Middle Euphrates towns and cities, where the Sumerian term KÁ referred to both the city gate and the people who lived in its vicinity (Ristvet 2011: 5; 2015: 57).

The ancestor cult was expressed in elaborate rituals performed by the head of the House, by the construction of an intramural pantheon, or by both, and also by the use of heirlooms and exotics as objects with biography (Kopytoff 1986; Whitley 2002), which help to preserve the memory of the family's heroic past.

González-Ruibal and I (2016) have recently demonstrated that the Levantine societies of the late third to the first millennium BCE all possess these characteristics. But how and when did all these features appear?

2 From Collective to Individual Rule

Based on the settlement pattern analysis of different Early Bronze Age Levantine sites, Chesson (2003: 86) suggested that the emergence of competitive Houses was governed by a corporate civic council. Notwithstanding, many scholars, including Chesson herself (2003: 94), Peltenburg (2007–2008), and Morandi Bonacossi (2014: 426ff.), perceived significant social changes that occurred during the Early–Middle Bronze Age transition. The mortuary record of Bab edh-Dhra' shows the emergence of a House identity from Early Bronze (EB) II–III onward (Chesson 2003: 95–97; de Miroschedji 2009: 105). Other authors (Porter 2002; Peltenburg 2007–2008: 224ff.; Schwartz 2012, 2013: 505–517) demonstrate how mortuary patterns in the Middle Euphrates Valley reflect

ideological changes that occurred in the area, with burial plots devoted to restricted kinship.

It seems that the corporate structures of authority, typical of tribal institutions (Fig. 14.1), began to evolve into other structures, based on a more restricted kinship affiliation. Nevertheless, some collective structures survived when the state arose, and the early second-millennium Mesopotamian city-states enjoyed a heterarchical system of government. The existence of assemblies of elders as well as other institutions that shared governing responsibilities with the king, to some extent, is well known (Blanton and Fargher 2007; Ristvet 2011: 7). According to Sanders (2012: 198), the West Semitic lexicography of the second millennium reveals the strong weight of the tribe still underlying the state institutions. Thus, in Mari, as well as in Emar, the component *lim* (people/tribe) appears in names of kings or divinized individuals. On

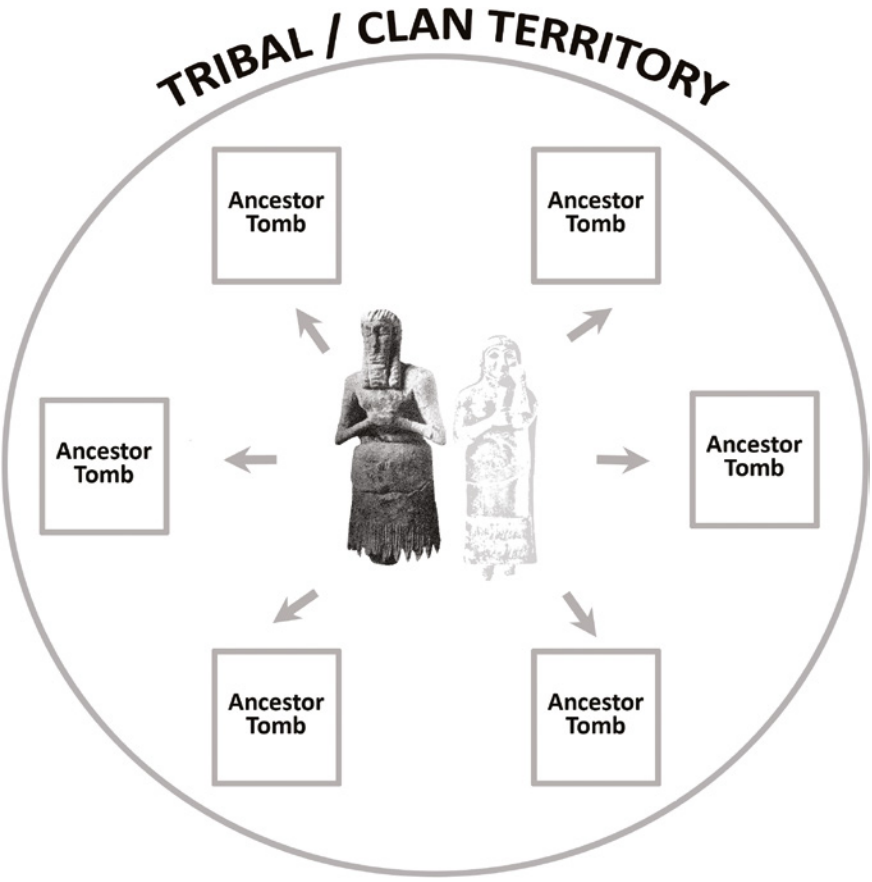

FIGURE 14.1 Collective source of rule; the king shares power with his clan representatives

the other hand, the coastal city-states as Ugarit, evolved into typical Syrian detribalized monarchies, albeit preserving a terminology associated with people as political actors and council institutions (Ávalos 1995: 622; Sanders 2012: 206). Assemblies of elders pervaded also the first-millennium kingdoms of Phoenicia and Israel (Ávalos 1995: 622).

Sites as extensively investigated as Ebla may provide textual and archaeological clues about the appearance of individual lineages emerging from the collective ethics.

The Ebla marriage and coronation texts offer us an insight into the roots of power and authority in Ebla (Biga 1998, 2007–2008: 256; Biga and Capomacchia 2012; Servadio 2009: 36ff.; Ristvet 2011: 8ff.; 2015: 40ff.; Archi 2013: 223; Matthiae 2015: 112ff.). The ARET 11 series includes two texts referring to the wedding and coronation ceremonies of the last two kings of Early Bronze Ebla (2400–2350 BCE). One of these texts includes the rite of incorporation of the bride, King Išar-Damu's cousin, whose father was a brother of the late King Irkab-Damu. On the night before the ritual begins, the bride-to-be camps outside the city; at dawn she crosses Kura's Gate, named for the protector god of the city, and ascends to Kura's Temple, where she takes off her clothes and dresses as a bride. She then brings offerings to Kura and the other gods of Ebla from her father's house, and proceeds to the palace where the wedding ceremonies are performed. The gestures of crossing Kura's Gate, undressing, and putting on new clothes are part of a rite of incorporation (van Gennep 1986).

Even more interesting is the pilgrimage from Ebla to Binaš that the royal couple embarks on after their wedding, visiting the royal pantheon accompanied by their retinue and the statues of the city gods, Kura and Barama. This four-day pilgrimage includes six sojourns in different cities in which the couple makes offerings and performs ceremonies in the tombs of other heroic ancestors. During these ceremonies, the royal couple is transformed into a divine couple.

ARET 7.150 describes another pilgrimage to a more distant city called Darib, with the offering of ten rams to the gods and to the last ten deified kings of Ebla (Biga 2007–2008: 267; Ristvet 2011: 12; 2015: 68–69; Matthiae 2015: 112ff.). As several scholars have suggested (Ristvet 2011: 9; Archi 2013: 232; Matthiae 2015: 116), the towns included in the pilgrimage are all close to Ebla and could have demarcated the ancestral territory of the dynasty. Thus, as the reading of another text, Tablet 74.120, suggests, some of the ancient rulers of third-millennium BCE Ebla were seminomads of the Syrian steppe (Bonechi 2001: 62).

Several aspects of these rituals are meaningful for my argument:

1) At least in one case, ARET 11.2, the bride, Tabur-Damu, and the groom, Išar-Damu, are cousins (Biga 1998: 84), and as part of her rite of incorporation, Tabur-Damu brings offerings to the city's god from her father's

House. Archi (2013: 228) emphasizes that the ceremony was perceived as the wedding of the queen. These aspects recall Goody's (1976) dowry marriage system and Schloen's (2001: 258) patrimonial kingdoms, where every household emulates the structure of the kingdom. Both, as explained above, are specific features of a House society.

2) The pilgrimage to the royal couple's ancestral territory was a mnemonic device to maintain the memory of the dynastic origins, but it also suggests that the power of the ruler was still deeply entangled in extensive kinship or clan ties.

Nevertheless, things seem to have changed at the time of Išar-Damu, the last king of Ebla recorded in the archives, if Matthiae (2015: 114ff.) is correct in identifying him as the king for whom the hypogeum excavated under Royal Palace G was built. The tomb was found empty and, although it may have been plundered, Matthiae thinks that it was meant to be the dynastic pantheon of Išar-Damu and his descendants, but was never used because the city of Ebla was abruptly destroyed. As the aforementioned author points out (ibid.: 116), this fact marks a profound change from extended to restricted affiliation, which Peltenburg (2007–2008: 237) describes as a "privatization of the ancestors."

Other important changes conducive to the deification of Ebla's queens seem to have been undertaken by Išar-Damu (Pinnock 2015: 140). Matthiae (2015: 116) interpreted the standard with two female figures that was discovered in a store of Palace G, as Queen Tabur-Damu mourning in front of a deified queen's statue, identified as Dusigu. Dusigu was Išar-Damu's mother and one of King Irkab-Damu's harem ladies, who, after the king's death, managed to set her son on the throne and become a regent when he was young (Biga 2003: 355–358; Matthiae 2015: 116). Pinnock (2015: 139–140) notes that the Ebla archives of the EB IV allude to kings who were deified in the past but not to queens, and that it was only during Išar-Damu's reign that queens were first deified too.

It was at the very beginning of the Middle Bronze Age that the tendency toward an intramural location of the royal pantheon seems to have become prevalent. This is the case for Palace G in Ebla (Matthiae 2015), for Qatna (Pälzner 2007, 2015), Tuttul, the small palace of Mari (Peltenburg 2007–2008: 232), and possibly for other palaces such as Alalakh—although the chamber tomb there was already plundered when Woolley found it (Woolley 1953: 75–76)—Jericho, and Byblos (Nigro 2009a, 2009b).

These changes into a restricted affiliation of the ruling dynasty could also explain the placing of almost life-size king and queen statues at the entrance of the administrative area of Palace G in Ebla. According to Pinnock (2015: 135), more than they were royal portraits, they may have represented archetypes of the monarchy. Thus, and following my point, it is from that point on that the

palace complex emerged as a seat of the administrative and cultic functions of the dynasty represented by the hypogeum under Palace G. This is the kind of entity that we could more accurately call a house, or better yet, a royal House.

Burials within the urban area are not infrequent in many Syrian cities from the late third millennium BCE, the time of the Ebla archives (Biga 2007–2008: 254–255). Nevertheless, they became even more frequent during the Middle Bronze Age. It was then that subterranean tombs were built beneath the main palaces at Megiddo, Jericho, Tel Ta'anach, Kamid el-Loz, Alalakh, and Byblos (Nigro 2009a: 368–374, n. 12). It is also then that three interconnected royal hypogea were dug beneath the throne room of the Western Palace at Ebla. At least one of them could be identified as the tomb of Immeya, King of Ebla. Among its lavish grave goods, a bone talisman stands out, thanks to the scene carved on it and interpreted as the deification banquet of a deceased king (Matthiae 2015: 117). Interestingly, the character is portrayed holding a shepherd's crook,[1] a symbol connected to the House ideology in the ancient Near East from the end of the third millennium BCE on (González-Ruibal and Ruiz-Gálvez 2016: 401). But, especially significant is the fact that the hypogea were located in the Western Palace, for several reasons: This cardinal point is symbolically connected with the sunset and the underworld and was therefore the seat of the crown Prince, who was in charge of the royal funerals; it was also located next to the temple of Rashap, Lord of the Underworld, where the deified kings were worshipped (Matthiae 2015: 144ff.) A central room with a continuous bench running along three of its four walls and two rooms at the rear of the complex, for food processing, suggest its use for Kispû/Marzeâh meals. The location of royal tombs under the palace's floor connects the palace with the Mesopotamian concept of a cosmic center, the seat of the gods and of the deified monarchs and, therefore, a meeting point between the heavenly world, the world of the living, and the underworld. In a similar way, Schwartz (2013: 505) interprets the Middle Bronze elite burial area at Umm el-Marra—a circular enclosure on the top of the site—as a cosmic center (Fig. 14.2)

The Mari palace is an example of such a cosmic center, with the cultic areas devoted to Ištar and other gods and goddesses, and kispû rituals regularly performed in the throne room. In Pfälzner's words, "the palace of Mari was a place of the gods as well as that of the kings" (Pfälzner 2015: 421; see, also, Charpin 2012).

In Mari as much as in Ugarit, Qatna, and other second-millennium Syrian kingdoms, the Amorite kings made use of the divinization of deceased kings to support claims for rule, based on the divine source of kingship. And, as the

1 I thank Isabel Muntalt (Pompeu Fabra University, Barcelona) for calling my attention to this detail.

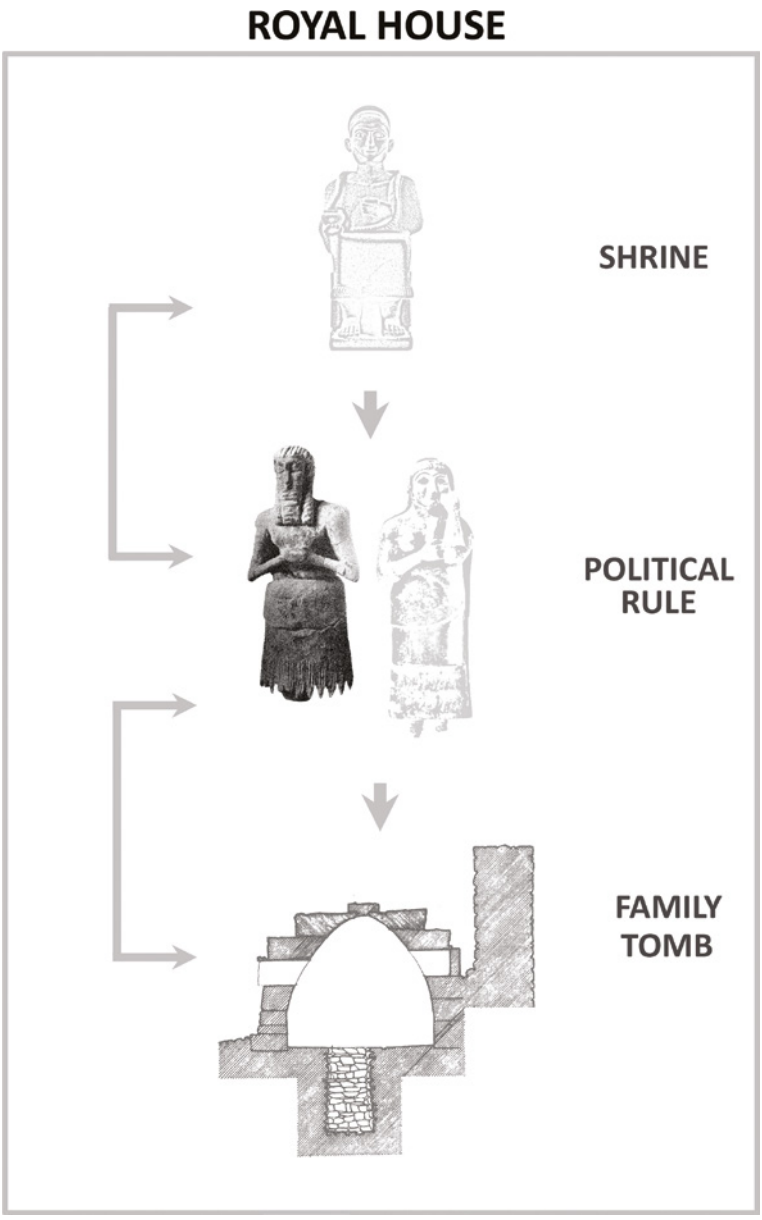

FIGURE 14.2 Individual source of rule based on the royal house as a cosmic center

divine royal ancestors also resided in the palace, the palace itself became a sacred building from which the king's ancestors continued to rule and provide prosperity for their people (del Olmo 2006, 2012; Pfälzner 2015).

The following features may be considered criteria to identify palaces and royal dynasties as House societies:

- Bilaterality: This explains the divinization not only of dead kings but, in some cases, also of dead queens, as in the case of Dusigu (González-Ruibal and Ruiz-Gálvez 2016: 387).
- Houses functioning as shrines or temples and the investment in the material wealth of the house.
- A concern with the past: The Middle Bronze palace of Qatna was built above a previous Early Bronze burial area, and some of the burials were integrated into its foundations (Pfälzner 2015: 433); the Old Babylonian palace of Mari rested on a cultic area (Charpin 2012), and the MB I royal tombs lay below the MB II Royal Palace (Nigro 2009b); Jericho, Ugarit, Qatna, Megiddo, and Kamid el-Loz, among other Middle Bronze palaces, accommodated royal hypogea beneath them (Nigro 2009a; Pfälzner 2015).

Moreover, the House society model is mimicked by the affluent families of the kingdom. A well-preserved MB II neighborhood in the southwestern sector of the Lower Town of Ebla provides us with a good insight of the kinship structure of the time (Ascalone, Peyronel, and Spreafico 2014). Houses are agglomerated; though they share dividing walls, they differ in size and plan and only some of them have a first floor apart from a ground floor. Houses were constantly refitted, enlarged, or partitioned, according to the family growth and other social or hierarchical changes within it. Many of the houses, such as the northeastern house in the central insula, stored a great amount of food, which suggests that the families that lived in them owned agricultural plots close to the city. This could be confirmed by finds recovered in three houses: a tablet, a cylinder seal, and three scale weights connected, perhaps, to the administration of the landed patrimony.

All these features also correspond with the definition of Houses as economic and social entities, with the agglomerated pattern of urbanism as a blueprint of a system of extended kinship, with lesser members and affines occupying small buildings around the main House, as described in Schloen's "House of the father" model (2001: 105–107, 336–337; see, also, Ur 2010: 412).

A further clue for the emergence of a House society system in northern Mesopotamia and the Levant is provided by the erection of family pantheons belonging to aristocratic families inside the urban precinct, below or next to their houses. This is the case of a chamber tomb discovered under Street L in Ebla, used for several generations and dated to MB II, the time of the Royal Pantheon of the Western Palace. Some evidence suggests that funerary banquets were held during the burials, emulating, perhaps, the royal rituals (Moglianzza and Polcaro 2010). Familial tombs with an entrance from the street are also known in

Middle Bronze Ugarit (Marchegay 2008:107), and van der Toorn (1996: Chapter 3) describes an ancestor cult practiced by families and burials under the house floor beginning in the Old Babylonian period.

3 Epilogue: Why Did House Societies Emerge in the Early–Middle Bronze Age Transition?

There is probably not a single answer for this question as many factors must have contributed to this development. One of them may have been instability resulting from the 4.2 ka BP climatic event with its ensuing draught and soil degradation. These, in turn, probably brought about changes in resources management, resulting in a higher concern for the control of landed property and growing contacts between urban populations and seminomadic groups. The latter may have contributed to the formation of what Porter (2007) and Burke (2014, 2017) call the Amorite koine or the Amorite identity.

Among the cultural features described above, the patrimonial model and the concept of the ruler as a shepherd of his people (Schloen 2001: 120–121) could certainly have a relevant role. From the days of Sargon I onward, the Akkadian kings were given the epithet of shepherd, and the Ugaritic god Hilal was also called "Lord of the shepherd crook." This epithet seems to be connected to the idea that the gods were the real owners of the kingdom and the kings were the shepherds appointed to watch over the gods' patrimony (Schloen 2001: 120–121; González-Ruibal and Ruiz-Gálvez 2016: 400–401).

The harsh climatic conditions, including a drastic decline in rainfall regime caused by the 4.2 ka BP climatic event, impacted dry farming systems that were practiced together with pastoralism and trade by the Amorites, who, according to the texts, were settled in northern Mesopotamia and the Levant at the end of the third millennium BCE (Porter 2007: 108; Burke 2017: 267–270). Paleoclimatic records show increased human control of aquifers in both regions in the Early–Middle Bronze Age transition as a result of the interplay of climate- and man-induced environmental changes (Pustovoytov and Riehl 2016). Although in Burke's view (2014: 358) the formation process of the Amorite cultural and social koine had begun earlier, many of its features—strategies aimed to avoid splitting the landed patrimony; the ancestor cult; and the stress on endogamous, bilateral, patriarchal, and patrilocal kinship systems—might have been fueled or strengthened by the need to control critical resources, resulting in deep structural changes.[2]

2 My deep gratitude goes to my colleague Eduardo Galán for helping me with the illustrations.

4 Summary

In the present paper I contend that the Kingdom of Ebla, as many other kingdoms in the Levant and northern Mesopotamia, had evolved from a tribal to a more restricted system of affiliation, compatible with Schloen's (2001) model of patrimonial kingdom or Lévi-Strauss's (1981) House society system. Key facts can be summarized as follows:

- House societies are heterarchical systems, more complex than chiefdoms but less complex than states, which are hierarchical and class-based systems. This is due to the fact that House societies, as relics of their tribal roots, are corporate systems in which an elders or city assembly shares and counterbalances the king's power.
- House societies emerge where resources are scarce or critical for subsistence and controlling them becomes a power-wielding strategy, such as rights on salmon fishing in Yurok and Kwakiult societies, or rights on good arable land, in semiarid regions as those of the Mediterranean and the Near East.
- Although there is no unique reason that explains the emergence of a House society system during the Early–Middle Bronze Age transition in northern Mesopotamia and the Levant, it seems reasonable to assume that stress put on dry farming systems by severe droughts and reduced rainfall that were a consequence of the 4.2 ka. BP climatic event, may have triggered underlying processes of profound social and affiliation changes.
- Marriage in EB IV, as typical in societies with complex agricultural systems, was already based on a dowry system (Goody 1976) and endogamous alliances among close relatives, to reinforce allegiances of the kin group. This is demonstrated in the marriage and coronation texts from Ebla. Nevertheless, the pilgrimage to the royal couple's ancestral territory proves that kingship was still rooted in broad tribal ties.
- From the Early–Middle Bronze Age transition on, the northern Mesopotamian and Levantine kingdoms can be called Houses. The house of the king becomes an archetype of kingship, a kind of axis mundi, or meeting point between heaven, earth, and the underworld, in the sense that it was the seat of political rule (the throne room), cult (ancestor cult) and dynastic rights to govern (mausoleum of deified kings).

Affluent Houses emulate the "House of the king" model (Schloen 2001: 120–121, 331). In this way, agglomerated houses with a common dividing wall in MB II Ebla suggest that extended families lived together in a neighborhood. The fact that only one of the houses seems to have been larger and equipped with a second floor, suggests a model similar to Schloen's (2001: 336–337) for Ugarit or Late Bronze Canaan/Iron Age Israel, among many others (Brody 2009; Faust 2012;

Gilboa, Sharon, and Zorn 2014). The erection of family tombs inside the Ebla precinct, next to or below the houses, can be understood in the same way, because House societies are competitive and unstable systems, within which affluent Houses compete with each other and with the royal House to seize prestige and power.

CHAPTER 15

Phoenicians and Corinth

Susan Sherratt

This paper is written for Michal Artzy, whom I first met almost 30 years ago, and who has been the kindest of friends and a constant source of inspiration ever since. As I (and others) are well aware, and as many of her publications make clear, Michal knows far more about ancient maritime matters and ships and their representations than I am ever likely to (see, e.g., Artzy 2003), but I hope she will like the Phoenician trading ship that I venture to identify at Corinth in this tribute.

1 Introduction

I have been thinking recently about the relationship between Phoenician mariners and Corinth because, although it seems clear that Phoenician ships were using the long open sea route via southern Crete (particularly Kommos) to the far west of the Mediterranean from the end of the tenth century BCE onward, it seems inconceivable to me that they did not also make use of the route via the Isthmus of Corinth, probably already from the ninth century, but certainly in the eighth and subsequent centuries. Here I find myself fighting against a long-standing prejudice on the part of much classical scholarship, which, for much of the twentieth century, denied the possibility of Phoenician activity in the Aegean until at least the end of the eighth century, and, until relatively recently, of Phoenician precedence over Greek activity in the central and western Mediterranean. Things, however, have gradually been changing, and, as Martin Frederiksen noted as many as 40 years ago, "the Phoenicians are on the way back" (Frederiksen 1976–1977: 43; cf. Ridgway 1994: 38–40). While this observation was made specifically in relation to the evidence for physical Phoenician presence on Pithecusae (Ischia) and in Etruria, it also referred more generally to a resurgent interest in Phoenicians, particularly in the central and western Mediterranean. Since then, Phoenicians have continued to make their way back to southwestern Spain from the beginning of the ninth century onward (González de Canales, Serrano, and Llompart 2006; Nijboer and van der Plicht 2006; and various papers in Celestino, Rafel, and Armada 2008), to Sardinia (Oggiano 2000; Ridgway 2006: 244–249), to Euboea in the later eleventh

© KONINKLIJKE BRILL NV, LEIDEN, 2020 | DOI:10.1163/9789004430112_017

to ninth centuries (Papadopoulos 1997, 2011; Theurillat 2007), to Crete from at least the tenth century (Shaw 1989; Stampolidis and Kotsonas 2006) and even, if perhaps not much before the eighth century, to the northern Aegean (Kasseri 2012; though, see, also, Papadopoulos 2005: 588–592). Moreover, the idea that Greeks, particularly "enterprising Euboeans," were solely responsible for bringing oriental objects into the Aegean and for distributing their own pottery around the Mediterranean in the early Iron Age (e.g., Popham 1994; Boardman 1996) now begins to seem increasingly implausible (González de Canales, Serrano, and Llompart 2006: 25–26 ; Ridgway 2006: 247; Kourou 2012).

2 Phoenicians, Corinth, and Pottery

My interest in the Phoenicians and Corinth has been sparked by a number of stimuli over the years. In the first place, there is the well-known association between Phoenician and Corinthian ceramic and other material in the central Mediterranean, not least at eighth-century Pithecusae (Ridgway 1992: 111–118), so far seemingly the earliest Greek settlement in the central Mediterranean (Buchner 1966) and, according to Strabo (5.4.9), founded by Chalcidians and Eretrians from Euboea; and it occurred to me to wonder about the routes by which these different types of pottery got there. A breakdown of imported pottery from the Valle di San Montano cemetery (Ridgway 1992: 72–82, figs. 18–20, tables 3–5)—although the absolute numbers are small—suggests that, while its majority (63.8% of a total of 285 pots) came from Corinth,[1] the remainder (some 36%) came from beyond the isthmus—from Rhodes, the Levant, and Euboea, in that order.[2] Given that pottery is a commodity that is typically

1 The "Argive monochrome" lekythoi found in the cemetery have been counted as coming from Corinth, since it seems possible that at least some of these may have been made in or around Corinth (Stillwell and Benson 1984: 14; Kourou 1987). For these pots and their possible contents, see Kourou 1988.

2 If these numbers are broken down into two consecutive periods (Late Geometric I [ca. 750–725 BCE] and Late Geometric II [ca .725–700 BCE]; see Ridgway 1992: 69), it can be seen that in the earlier period, although the overall number of imported pots (27) is much smaller and the dominance of Corinthian pottery (17) continues, a somewhat larger number proportionally (7) starts its journey in the Levant and outnumbers Euboean imports (3). In the later period (a total of 258 imported pots) aryballoi from Rhodes are second in frequency to Corinthian pots, followed by Euboean and Levantine products (see Ridgway 1992: figs. 12, 18, 30, tables 4, 5, pl. 5). It is perhaps worth noting that the imported pots from the Valle di San Montano cemetery that had traveled furthest were often ones that traveled for the sake of their contents, rather than simply as pots: for example, the Rhodian "Kreis-und-Wellenband" aryballoi and Levantine flasks, both of which can be assumed to have contained perfumed

subject to seaborne tramping trade, picked up where it is available and disposed of as soon as a ready market is reached, it seems likely that at least a number of the ships that brought pottery to Pithecusae started in the southeastern Aegean, or even further east, and arrived in Pithecusae via the Isthmus of Corinth. In pre-Diolkos days this could well have involved ships of up to 16 m or so in length being hauled over the isthmus with the help of rollers,[3] but, in any case, it seems quite clear that the isthmus route was quite extensively used in even earlier periods, including the later thirteenth–eleventh centuries, when increases in settlement activity around the Corinthian and Saronic Gulfs and in the Ionian Islands, together with the distribution of amber and "Urnfield" and Cypriot bronze types suggest this (Harding and Hughes-Brock 1974: fig. 3; Mederos and Harrison 1996: fig. 5; Sherratt 2001: 235–236; 2000, fig. 5.1). The growth of Corinth, which can be traced from at least the late tenth century (Salmon 1996: 390) and of the Isthmian sanctuary from the eleventh century (Morgan 1999: 373) seem, at any rate, unthinkable without the isthmus.

Once we get rid of the idea, quite common until recently in classical circles, that only traders from a particular center could transport that center's pottery (see on this, e.g., Papadopoulos 1997: 193–194; Morris and Papadopoulos 1998: 254–258), it seems reasonable to suppose that eastern ships traveling via the Isthmus of Corinth may have conveyed at least some of the Corinthian pottery that pervades the central and western Mediterranean in the eighth and seventh centuries.[4] Corinthian pottery is by far the most frequent Greek pottery

---

oils (cf. Coldstream 1977: 228). In the settlement areas, however, imported pots that cannot have traveled with anything in them predominate among the fine pottery. In order of frequency these consist chiefly of Corinthian, Euboean, and Phoenician Red Slip, in addition to those of local manufacture (Ridgway 1992: 89).

3 The Diolkos—the trackway constructed so that ships could be hauled on wheeled trolleys over the isthmus—was probably built during the reign of the tyrant Periander ca. 600 BCE (Lewis 2001: 11–15), which in itself is a good indication that a sufficient number of ships had been using the isthmus for enough time for the need for it to be felt. A length of up to 16 m for a clinker-built ship being hauled on rollers has been suggested as feasible for the much later Varangian portage routes, which often included much longer haulage distances (Stalsberg 2001: 370). A couple of wrecks of eighth-century Phoenician merchant ships loaded with hundreds of wine amphorae and located in deep water off the southern end of the Levantine coast were ca. 14 m long (Ballard et al. 2002: 157) and, therefore, probably capable of being hauled across the isthmus without the Diolkos. See, also, Herodotus 7.24, where he remarks that Xerxes' men could have drawn their warships across the isthmus of the Athos peninsula without trouble, but that he chose instead to construct a canal as a means of displaying his power.

4 Cf. also van der Brugge 2016: 328. This must almost certainly be so in the case of the eighth-century Corinthian Geometric kotylai found together with Phoenician Red Slip juglets and an alabastron in Tomb 19 of the Laurita necropolis at Almuñécar on the Málaga coast of

found in the West and on the North African coast in this period, and also finds its way eastward into most parts of the Aegean (Salmon 1984: 101–109). That, indeed, easterners may have had a hand in positively developing the Corinthian pottery industry for export has been argued by Sarah Morris and John Papadopoulos (1998), who point out that the development of proto-Corinthian pottery, toward the end of the eighth century, owes much to oriental influence.[5] This can be seen in the prominence of shapes such as the globular aryballos[6] and the alabastron, which, along with contemporary lekythoi and Rhodian aryballoi, share the flat mushroom lip (and very probably the contents)[7] of earlier and contemporary Phoenician flasks and other small container shapes (cf., e.g., Ridgway 1992: figs. 8: 16–19; 12; 14: 8–13; 30; pls. 5, 7, 8). But it is evident also in the decorative style (first found on aryballoi), which includes oriental animals and the use of incision for outlines and details, and seems particularly evocative of engraved metalwork as represented, for example, by the Phoenician bronze and silver bowls that become increasingly widespread in the Mediterranean from the ninth century onward (Markoe 1985, 1996: 50–54; 2000: 148–150; Morris and Papadopoulos 1998: 252–254). Morris and Papadopoulos go on to discuss other possible indications of a Phoenician involvement with Corinth, which include the cult of Aphrodite Ourania (who might well be thought of as a goddess of navigation) as official protectress of the city.[8] It has been suggested by Charles Williams (1986) that this cult came directly from Phoenicia, and, indeed, Herodotus (1.105) tells us that the temple of Aphrodite Ourania at Ashkelon was the oldest of all temples of this goddess. Williams (1981) has also drawn attention to the existence of a number of stelae

---

southeastern Spain (Aubet 2001: 292). For other types of Greek pottery carried west by Phoenicians even earlier than this, see further below; and see Pseudo-Scylax's *Periplous* 112c [Lipiński 2004: 462–464] for Phoenician merchants selling Attic pottery at Kerne on the northwestern coast of Africa.

5 As a corollary to this, it is perhaps no coincidence that the possibly locally made Late Geometric pottery from the precinct of Tanit at Carthage seems to have affinities with the pottery of Corinth (Coldstream 1968: 386–387; cf. now Docter 2014).

6 The globular aryballos with a wide flat disc lip already appears in Corinthian pottery in the late ninth or early eighth century (see, e.g., Weinberg 1943: 18 no. 63, pl. x; cf. Coldstream 1968: 94–95, pl. 17: c), but it is only toward the end of the eighth century that it first acquires "Orientalizing" decoration.

7 For Corinth's fame in the distant past as a producer of iris-scented unguent, see the first-century writer Pliny (*NH* 13.2).

8 Perhaps the equivalent of the Phoenician Tanit, or one of those other versatile Levantine goddesses associated with marine navigation and the protection of seafarers, who have a tendency to run effortlessly into one another. On the question of temple prostitution in the temple of Aphrodite Ourania at Corinth, see Fauth 1988: 38.

shrines of sixth–fifth-centuries date, including one in the Potters' Quarter, some of them not dissimilar in general to stelae or cippi found on early Iron Age Crete and in the Punic West (Morris and Papadopoulos 1998: 258, pl. 21; cf. Stampolidis 1990; Moscati 2001), or to elements of the Phoenician shrine at Kommos (Shaw 1989: fig. 10). Morris and Papadopoulos (1998: 259–261) also consider various elements in the foundation and other mythology of Corinth, which could be construed as suggesting some close Phoenician connections (cf. West 1997: 58). Other hints at Phoenician involvement in the life and religious practices of Corinth are listed by Eckert (2016: 127, 129–133).

3 Phoenicians, Corinth, and Euboean and Attic Pottery

Before I go on to discuss another small piece of archaeological evidence that may indicate a close Phoenician relationship with Corinth, it is perhaps worth considering some of the Euboean and Attic pottery that was arguably carried westward on Phoenician ships. As González de Canales, Serrano, and Llompart (2006: 25) have pointed out, it seems unthinkable that the Euboean pendent semicircle skyphoi and the 15 pendent semicircle plates of the ninth or very early eighth century (which are rare in the Aegean, but relatively common at Tyre) that turn up at Huelva (González de Canales, Serrano, and Llompart 2006: 19, figs. 21–24) were carried all that way by Euboean Greeks. The same has been argued for a similar skyphos from Sant'Imbenia on Sardinia, which, like the Huelva material, was found in a thoroughly Phoenician context (Ridgway 2006: 244–247; Naso 2014: 171).[9] How, then, did these get there? Did they first go to Tyre (as a considerable number of such skyphoi and an impressive number of such plates did [Coldstream and Bikai 1988]), and were then transported westward via Kommos on southern Crete, along the southern open sea route, to the far west? This is certainly possible, but one problem is that, although there are a few Euboean pendent semicircle skyphoi on Crete, particularly at Knossos (Popham 1983: 281; Coldstream 1996: 403), there is no sign of any of the plates on that island, and even the skyphoi are absent from Kommos (Callaghan and Johnston 2000). One could probably argue that the inhabitants of Crete had little use for such plates, since the shape is a regular feature of eastern Mediterranean ceramic and metal repertoires rather than Aegean ones. But one could perhaps ask alternatively whether the plates that reached Huelva might have

9 For other examples of pendent semicircle skyphoi from the central Mediterranean, some almost as early as the Sant'Imbenia one and none of them later than the mid-eighth century, see Naso 2014.

traveled west over the Isthmus of Corinth. Although, against this, there are no Euboean pendent semicircle plates or skyphoi known from Corinth or the Isthmian sanctuary, in support of it we might cite the two plates from the Kerameikos cemetery in Athens (Kraiker and Kübler 1939: 130, pl. 52; Kübler 1943: 46, pl. 34), tucked in well to the west of the eastern entrance to the Saronic Gulf. These are accompanied by a few pendent semicircle skyphoi in Athens, and to the west of the Isthmus at Delphi (Lemos 2002: 46), which suggests that this may have provided a route westward. Together with these may have traveled the examples of late ninth/early eighth century Attic pottery, which also reached Huelva and other sites with close associations with Phoenicians in the western and central Mediterranean (González de Canales, Serrano, and Llompart 2006: 19, figs. 17–20; Kourou in press 2020). Later, from the mid-eighth century, early versions of Attic and Euboean "SOS" amphorae can also be seen to extend in their distribution from Huelva in the far west to the Levant (including Tyre) in the far east (Pratt 2015: figs. 11–14); and Pratt (2015: 231–232) is surely justified in finding further support for the suggestion, first put forward by Shefton (1982), that Phoenicians were heavily involved in distributing these around the Mediterranean. The association of later versions with Early Corinthian aryballoi, especially in the western Mediterranean, suggests that at least some of them traveled westward over the Isthmus of Corinth.

4 A Phoenician Ship at Corinth?

Finally, returning more narrowly to the question of Phoenicians and Corinth, I would like to draw attention to part of a ceramic plaque excavated at Penteskouphia, close to ancient Corinth, in 1879, among over 1,000 other plaques probably from a sanctuary of Poseidon, many of which show scenes of potters at work with potters' wheels and kilns. This particular plaque, now in Berlin (Furtwängler 1885: 90 no. 831; Fraenkel 1886: 3 pl. 8 no. 3a; Rayet and Collignon 1888: xv fig. 6; Basch 1987: 235, 237 no. 494; Casson 1995: fig. 98), has been dated by reason of its style to the seventh or sixth century. One side of the plaque shows a male figure identified by Furtwängler as Poseidon, with a human-headed bird flying behind him, and beneath this a man in a cave or hole digging something (perhaps clay) with a pickax (Fraenkel 1886: pl. 8: 3b) (Fig. 15.1). The other side shows the stern end of a ship with furled sail and brail rig, which Casson (1995: 69) has compared to the rigging of both Phoenician and Greek ships. Above the rigging, on either side of the mast, hangs a row of seven or more jugs of some material, while on top of the curved stern is a curious symbol consisting of a circular shape on top of a vertical pole, and above that a horizontal line. Behind

FIGURE 15.1
Terracotta plaque from the sanctuary of Poseidon at Penteskouphia, Corinth; Berlin Altes Museum, Antikensammlung no. 831 [P. 303] (other side of Fig. 15.2)
FRAENKEL 1886: PL. 8: 3B

this symbol is a row of three emblems that look like two-barred crosses, but could, given the difficulty of painting at this relatively small and crude scale, possibly be caducei (Fig. 15.2).

The main symbol on the stern of the ship has also been interpreted as a caduceus, or kerykeion, the short staff entwined by two serpents, and frequently shown in classical iconography as carried by heralds and often associated with the god Hermes or with Iris, the messenger of the gods—which, in some ways, might seem appropriate for a ship carrying goods or messages swiftly across the waves; however, by the seventh–sixth centuries, we would expect to be able to recognize a Greek caduceus without too much difficulty, and this symbol is clearly not one. Rather, it bears a much closer resemblance to the symbol found on the sterns of war galleys portrayed on Phoenician coins dating from the fifth century and later (Basch 1987: 320–325 nos. 675–682, 687; cf. Brody 2005: 179) than anything found in Greek iconography. This symbol consists of a crescent moon surmounting a sun disc, a motif that is often associated with the "sign of Tanit" on funerary and other stelae in the Punic West (Moscati 2001), and which can be related to an ancient Canaanite symbol (Tubb 1998: 146).[10]

10 For the association of the disc and crescent moon with Tanit, see Brody 2005: 179; 2008: 3. This symbol can also be found on funerary stelae from the eleventh–sixth centuries

FIGURE 15.2
Terracotta plaque from the sanctuary of Poseidon at Penteskouphia, Corinth; Berlin Altes Museum, Antikensammlung no. 831 [P. 303]; showing stern end of a ship (other side of Fig. 15.1)
FRAENKEL 1886: PL. 8: 3A

I would suggest that the main symbol on the stern is intended to indicate that this is a Phoenician ship. The symbol, which is recognizable from the portrayal of ships on Phoenician coins (see above) and from Phoenician and Punic funerary stelae, does not seem to appear on other contemporary Greek

al-Bass cemetery at Tyre (Sader 2005: 36–40, 52–53, figs. 17, 20, 34). The crescent on these and on the ships on Sidonian coins, as well as on stelae in the west, can point either upward or downward.

Some later Punic stelae combine the disc and crescent moon and the "sign of Tanit" with what we would recognize from Graeco-Roman iconography as caducei (e.g., British Museum ANE125117: a second–first centuries BCE stele with a dedication to Baal from the Tophet of Carthage, which also has a disc and crescent moon combination at the top of the stele [Tubb 1998: 140, fig. 98]; British Museum 1857,1218.30: fourth–second centuries, also from Carthage, and also with a disc and crescent moon at the top [Davis 1863: pl. 1: 2]; Quinn 2017: figs. 5.5, 5.6, from the Carthage Tophet). Much ink has been spilled for over more than a century on the question of whether the caduceus was originally a Greek or eastern symbol. For differing views on this, see, e.g., Frothingham 1916; Boetzkes 1967; Cross 1997, 31 n. 108. I would merely point out that it may well be in some way relatable to the image of a snake-legged goddess on a Canaanite gold pendant found by Michal Artzy at Tel Nami on the Carmel Coast and datable to the thirteenth century BCE (Artzy 1994: 125, fig. 4). This image, in turn, can be compared with those on a Mitannian seal impression on a letter in the Amarna archive and on some earlier Mitannian cylinder seals (Porada 1974–1977: 141–142, figs. 1b, 6–7), which Buchanan (1971) has associated with the underworld. That images like these (or at least their derivative, the caduceus) eventually become associated with Tanit seems likely (Brody 2005: 179).

representations of ships, including other plaques from Penteskouphia. Since almost half of the ship is missing, it is impossible to say what the other end looked like, but the shape of the stern, at least, seems similar to those of both Greek and Phoenician cargo and fighting ships in representations of the mid-first millennium (Basch 1987: 236–238 nos. 490, 493, 498; 321 nos. 675–678).[11] Was the plaque dedicated at a sanctuary of the god of the sea and protector of sailors by a Corinthian potter desirous of ensuring a safe journey for the Phoenician ship that carried his wares overseas, or was it dedicated by a Phoenician shipowner or captain, either based in Corinth or en route across the isthmus? The jugs suspended above the ship have been assumed to be Corinthian ceramic products (Rayet and Collignon 1888: xv), and they could perhaps be seen as somewhat crude and elongated representations of some examples of Corinthian trefoil-mouthed oenochoae (e.g., Amyx and Lawrence 1975: pls. 46–51), even though the jugs on the plaque appear to have taller conical feet. Their close similarity to jugs shown lying in a kiln on another plaque (Fraenkel 1886: 4, pl. 8 no. 19b; Rayet and Collignon 1888: xiv fig. 5) would suggest that they are local products, as does the possibility that clay is shown being dug up on the other side of our plaque, as well as the frequent associations between potters and plaques from the Penteskouphia sanctuary in general. On the other hand, jugs that could equally be seen to match these representations were being produced over a wide area of the Mediterranean world, including Greece, the Levant, and Etruria, in a variety of materials, including glass and metal as well as ceramics.

5 Concluding Remarks

There is not a great deal more that it is possible to say about this image, given the incomplete state of the plaque and the relative crudeness of the painting. Nevertheless, speculative though it may be, it perhaps adds yet another small fragment of evidence to those outlined earlier for Phoenicians operating at, or passing through, Corinth in the Archaic and preceding periods. If so, it probably should not surprise us. We have arguably become accustomed, until relatively recently, to thinking within our own specialized, and often protectionist, disciplines and geographical areas. Classical Greek archaeologists dealt only with Greeks in Greece and in lands (and at times) recorded as having been inhabited by Greeks; and Phoenicians (the province of Levantine archaeologists) threatened an alien intrusion into an otherwise ideologically self-contained world. As long as

11 For the belief that it is a merchant ship, see Chatzidimitriou 2010: 10–11.

separate archaeological disciplines did not regularly interact and intermingle, it was forgotten that people from different parts of the ancient world (ideally distinguishable archaeologically by their quite different material cultures) did, and just how mobile and cosmopolitan that world could be, even in the early centuries of the Iron Age. As Michal Artzy has shown for the Late Bronze Age, it takes excavation of a single harborside, as at Tell Abu Hawam, to show just how varied the origins of ships that called in there could be (Artzy 2006: 55).

Despite our archaeological obsessions with pottery, we need not worry (as some do) that Phoenician pottery is missing from Corinth in the early Iron Age and Archaic periods. Phoenicians were perfectly happy to use and/or reproduce other people's pottery, as the Cypro-Geometric and Euboean Subprotogeometric pots from sites such as Dor and Tyre, and the locally made "Greek" pottery from Carthage show (Coldstream and Bikai 1988; Gilboa 1999; Docter 2014); and, as long as these were available, they were content to use tableware and even small packaging vessels made elsewhere, in some cases—as the pendent semicircle plates reveal—made specially for them and designed to fit into their own repertoires (Coldstream and Bikai 1988: 39). The main goods for maritime trade that they produced in their home cities were other types of manufactures: fine textiles, glass and faience, elaborate carved ivories, and fancy metalwork. Trade in the pottery of others (including pottery as containers for other people's wine or unguents) was, to some extent, opportunistic—picked up because they were passing anyway and knew they could find a market (cf. Artzy 1985)—or, to a greater extent, because they were traders and designed their routes accordingly.

This brings us to the question of sea routes, which have only relatively recently been systematically considered, most recently of all (and occasionally rather mechanically) in the context of "network" approaches (Knappett, Evans, and Rivers 2008). Routes that link places purely by sea are one thing, but isthmuses and portages have always been just as important in long-distance seafaring and trading (Sherratt 2006), and, like mountain passes, act as funnels to attract sea travelers and thus provide stimuli to the local production of manufactured goods for maritime export by whoever is passing that way in either direction. The 5 km wide Isthmus of Corinth is undoubtedly the most famous and one of the shortest examples in the ancient world, and the ancients themselves were in no doubt that Corinth owed its prosperity as a commercial emporium to its situation on it (Thuc. 1.13), even if twentieth-century scholars of earlier generations might perversely have taken another view and, in Weberian fashion, argued that the city's wealth was built on its rich agricultural land rather than its location or even its commerce (Will 1955; Salmon 1984). It is my belief that Thucydides was right, and that Corinth would never have become

so wealthy in the first half of the first millennium BCE had it not been for its isthmus. This linked the Aegean and eastern Mediterranean with the central and western Mediterranean, and I have tried to suggest that ships of many different origins, including Phoenician ones, traveled across it.

Trade and power in the fifth and fourth millennia BC: new evidence from northern Mesopotamia

Joan Oates

Introduction

The formation of the earliest known cities (generally attributed to Late Uruk Mesopotamia, c. 3500 cal. BC) was accompanied by the foundation of 'colonies' and smaller 'outposts' in Syria, Anatolia and Iran, established apparently to secure various raw materials lacking in the Mesopotamian homeland. The growth in Sumer of organization(s) capable of constructing and administering such distant 'colonies' both reflected and contributed to increasing levels of social and economic complexity. The scale of the colony settlements, both in terms of size and distance, raises again the question of the role of long-distance trade in early state formation. The colony data are new, and derive largely from twenty years intensive 'rescue' archaeology along the Euphrates, both in the area of the Tabqa and now the Tishrin dams in Syria and of a series of dams in south-east Anatolia (Fig. 1). Since the discovery and excavation of Late Uruk Habuba-Süd/Qannas (Strommenger 1980) and Jebel Aruda (van Driel 1979) on the Upper Euphrates in north-western Syria, some 1,200km from the Mesopotamian heartland and the eponymous site, the role of these and other Uruk-related sites has received much attention (*inter alia*, Palmieri 1985; Sürenhagen 1986; Schwartz 1988; Algaze 1989). These new investigations have greatly expanded our knowledge of fourth-millennium BC contacts not only between Syro-Anatolia and southern Mesopotamia (and probably Elam) but also across northern Mesopotamia, represented archaeologically by the widespread distribution of identical, indigenous northern materials from beyond the Taurus in the west to the foothills of the Zagros in northern Iraq.

Two views have been widely accepted. 1) That the south Mesopotamian (Late Uruk) presence in Syria and Anatolia was of relatively short duration, and 2) that the motive for this cultural intrusion was the acquisition of raw materials such as metals, good timber, stone and other exotic items lacking in the environment of southern Mesopotamia. Existing data seemed to support the view that the Uruk network in the north-west collapsed at the end of the Late Uruk period (Eanna archaic IV, perhaps c. 3300 cal. BC, Behm-Blancke 1985: 94). At approximately the same time the monumental Eanna precinct at Uruk itself was demolished in preparation for a comprehensive rebuilding (Eanna archaic III) (Finkbeiner 1986), an event which has been interpreted as evidence of

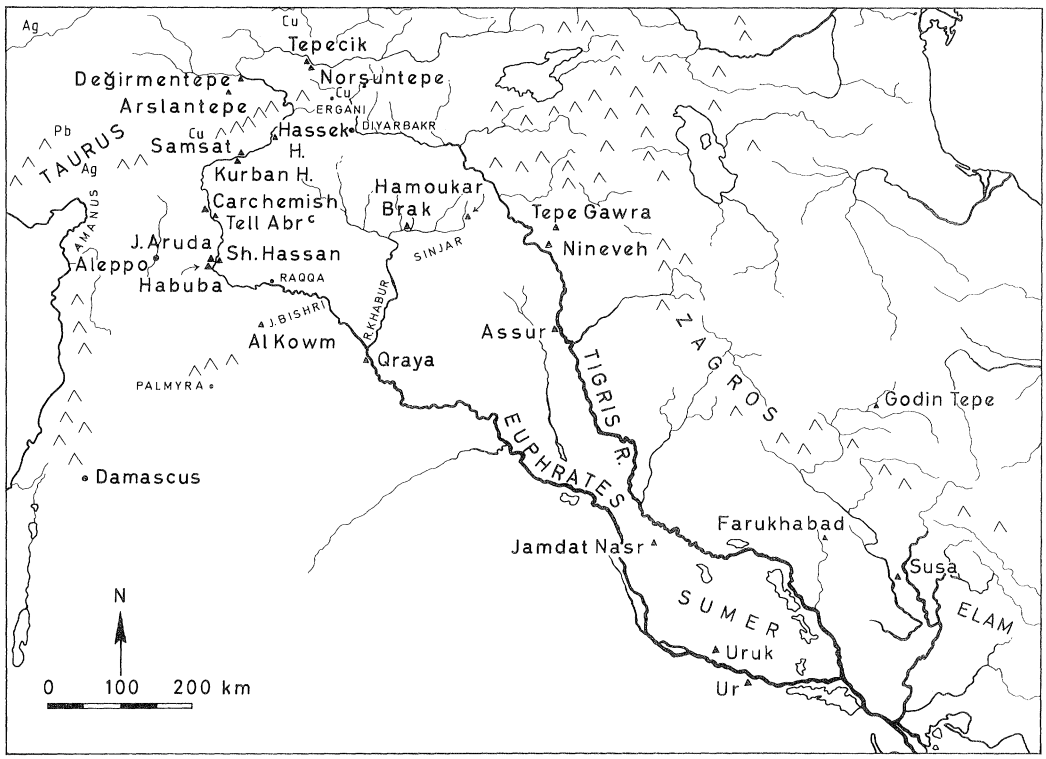

Figure 1 Map showing major sites mentioned in text. For discussion of routes, cf. Grant 1937; D. Oates 1968; 1977: 236; Palmieri 1985: 207; Algaze 1989: 579.

a major social or political upheaval, possibly to be identified with some conceptual shift and apparently coinciding with the loss of the northern 'colonies'. The presence of polychrome Jamdat Nasr pottery (= Uruk archaic III, though note the reservation expressed in Finkbeiner 1986: 33–4) in Oman (D. T. Potts 1986) and the widespread evidence of an eastern network based on Susa (Amiet 1986; T. F. Potts, this volume) seemed to emphasize both the loss of Anatolian raw material resources and some reorganizational need in Sumer itself at this time. Much emphasis has also been placed on apparent changes in settlement patterns (Adams 1981; Postgate 1986); at the same time the question whether the 'Jamdat Nasr horizon' had any separate, distinct, archaeologically identifiable reality was the subject of debate (Finkbeiner and Röllig 1986).

The site of Uruk/Warka provides the basic fourth-millennium BC Mesopotamian sequence. Indeed, with the exception of Nippur at which early Uruk materials have not so far been recovered, it remains the only Sumerian site at which extensive fourth-millennium levels have been examined. Yet up to now Uruk has yielded virtually no prime contexts. This fact has been much discussed with reference to the origins of writing (Nissen 1986); it affects equally the attribution of other types of artefact and has been responsible, *inter alia*, for disagreements as to the relative date of the 'Late Uruk' contact with Syro-Anatolia (e.g. Sürenhagen 1986: 32).

The decision to devote this issue of *World Archaeology* to 'Ancient Trade: new

perspectives' was taken over two years ago. At that time it was not the editor's intention to contribute. However, discoveries made this past spring at Tell Brak in north-eastern Syria have provided a 'new perspective' of some importance and the *raison d'être* for this brief commentary. These new materials *are* well-stratified and bear on the interpretation of Late Uruk expansion and its demise. They come from Brak Area TW (Oates and Oates 1989: fig. 1), where in 1991 we excavated some nine building phases consisting of small houses with walls of an unusual, square-section, oblong brick type (*riemchen*), characteristic of Late Uruk southern Mesopotamia. These houses yielded a very distinctive ceramic assemblage which immediately pre-dates the third-millennium BC (northern) Ninevite 5 (Oates and Oates 1991: 138–43). In the lower part of this sequence were buildings with grill

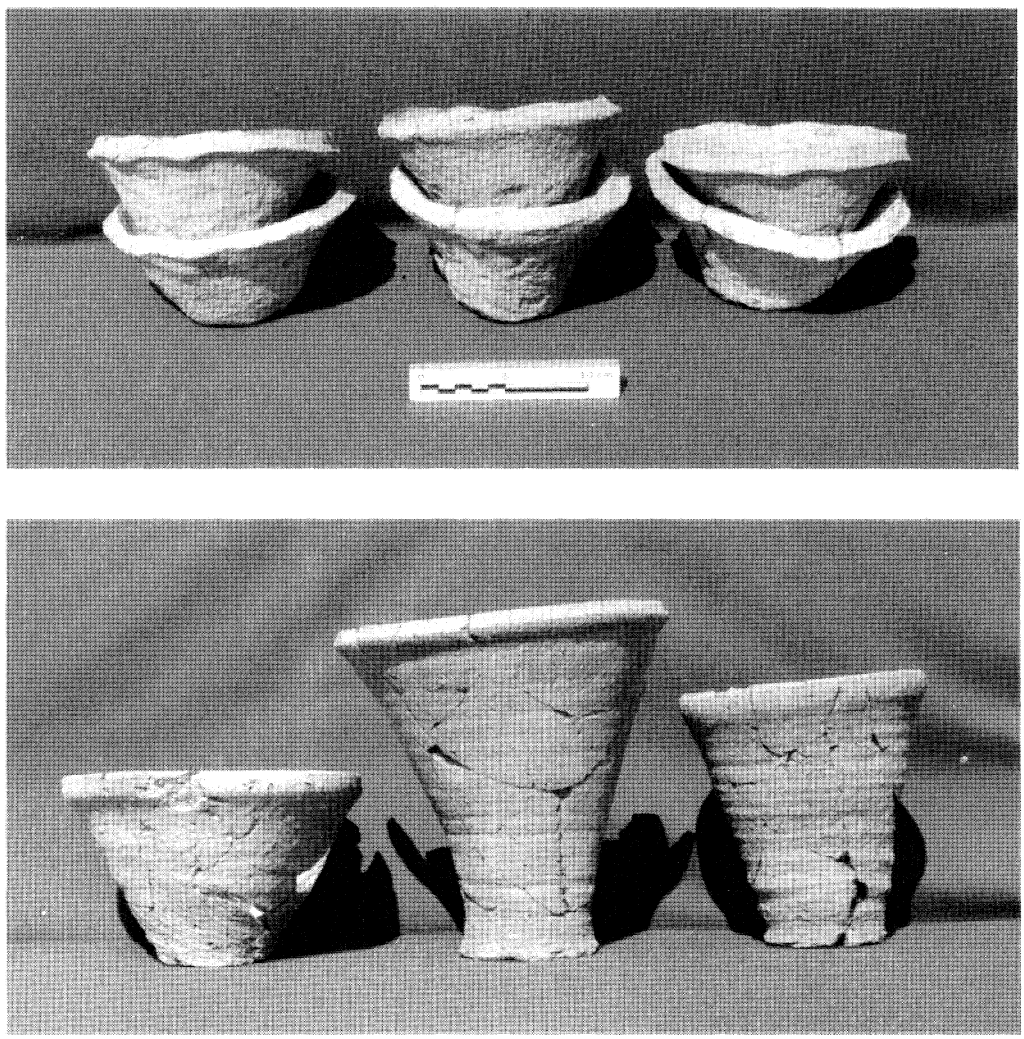

Plate 1 Mass-produced pottery types from the Area TW Jamdat Nasr and Late Uruk levels at Tell Brak. Above, bevelled rim bowls; below, Jamdat Nasr 'coarse flower pots', height of tallest 25cm (cf. Nissen 1970; Sürenhagen 1974/5; Matthews 1989; Pollack 1990).

foundations, a type known elsewhere at this time (Tell Karrāna 3, Fales et al. 1987; Hassek Höyük, Behm-Blancke 1985: fig. 1), below which lay the 1992 season's most significant discoveries. First, a level containing a number of ceramic types identical with those from the site of Jamdat Nasr, including two polychrome sherds (cf. Matthews 1992: figs 3, 4), the first discovery of such ceramics in the north. In addition to the familiar range of mass-produced vessels, a large number of unusually tall 'coarse flower pots' were recovered, a type not as yet attested elsewhere (Plate 1). Equally interesting was the large building which lay below the 'Jamdat Nasr' level, from which we recovered a wide range of complete vessels of Habuba/southern Uruk type (Plates 2, 3). This building would seem to be contemporary with, or perhaps just later than, the Tell Brak Area CH level 9–10 structures excavated in 1984, which contained largely indigenous northern Uruk material, also in situ (Oates 1986). This northern Uruk repertoire has a very wide distribution from the Upper Euphrates (e.g. Kurban Höyük, Algaze 1986; Karatut Mevkii, Schwartz 1988) to the northern Jazira in Iraq (Tell al Hawa, Nineveh).

The Jamdat Nasr ceramics, at present unique to Brak, extend the period of southern contact well into Eanna archaic III, and confirm Mallowan's earlier identification of Jamdat Nasr material at the site, in particular the famous Eye Temple (1947: 32, 60ff.; also Lebeau 1990: 253ff.). Other new information of major significance comes from Shaikh Hassan, across the Euphrates from Jebel Aruda, which has also yielded southern Uruk ceramics but of a date earlier than Habuba/Aruda (Boese 1986–7; Sürenhagen, pers. comm.). Together, these new data generate a very different picture of Uruk expansion

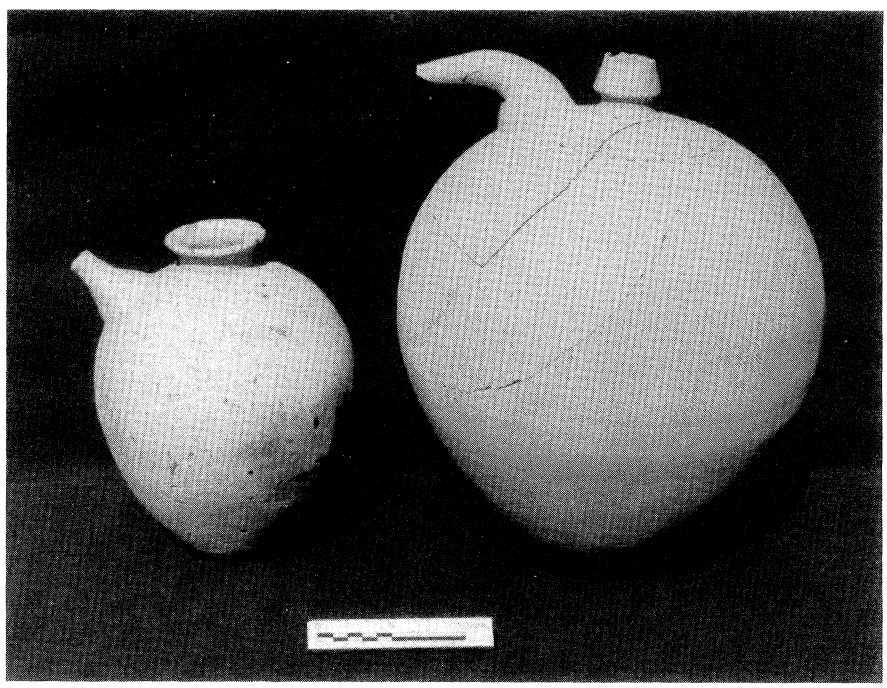

Plate 2 Late Uruk spouted vessels from Tell Brak, Area TW level 12. The drooping spouted jar bears both jab-incised and reserved slip decoration (cf. Sürenhagen 1974/5: pl. 12: 76).

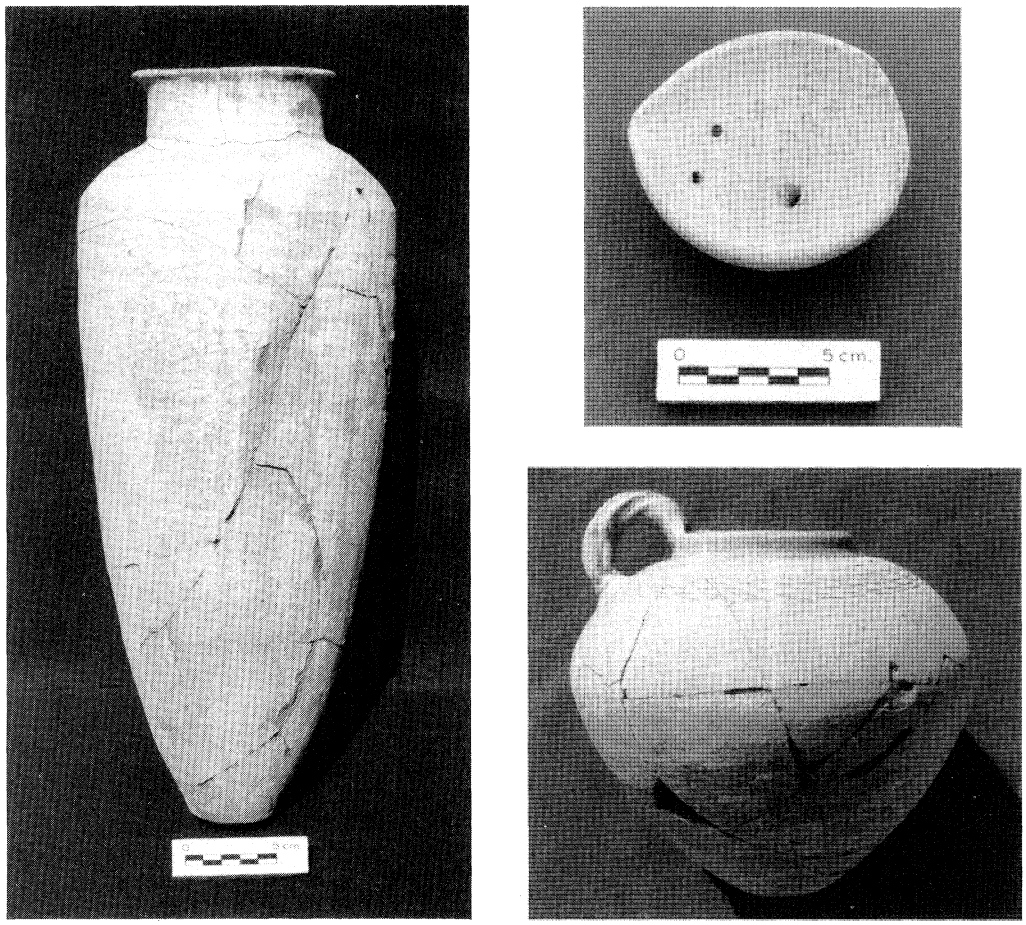

Plate 3 Late Uruk pottery, Tell Brak Area TW. Parallels for the small ladle can be found in Matthews 1992: fig. 2: 15, 16; Behm-Blancke et al. 1981: pl. 26; Sürenhagen 1974/5: pl. 19, 158.

from the 'short-lived foray' model (Algaze 1989: 571). It is the purpose of this paper to re-examine the evidence for long-distance trade in the fourth millennium BC, in the light of this and other new evidence.

Background

It is often asserted that Mesopotamia is wholly lacking in raw materials and that the necessity to organize the long-distance acquisition of such resources was a major factor in the early development there of complex political and economic forms. The development of extensive exchange networks is seen as important in rising social complexity, and especially in the growth of the bureaucratic controls that were developed to record, regulate and redistribute both local production and goods and raw materials from elsewhere. A contrary view is expressed in Wright 1981: 277–8.

Certainly the south Mesopotamian alluvium was lacking in metal, timber and exotic stone resources, but often it goes unrecognized that such items were far from necessities in any subsistence or survival sense. Moreover, some stone *is* locally available, including nodules of flint in the western desert, gypsum and a local alabaster (*Admiralty Handbook* 1918, 1944); and it has recently been shown that the limestone used in monumental buildings and elaborately carved vases at Late Uruk Warka came from a quarry only some 50km to the south-west (Boehmer 1984). The most crucial south Mesopotamian resource was of course the life-giving water of its two great rivers. The ubiquitous alluvial silts provided not only rich soils but also the elaborate ceramics found at the earliest settlements in Sumer and the mud-brick with which these settlements were built. Roofing materials suitable for ordinary (but not monumental) household structures derived from riverside trees such as poplar and reeds or reed matting, another certainly indigenous product. Grazing was widely available (Oates and Oates 1976: 120), and the ubiquitous occurrence of spindle whorls in the earliest villages attests an extensive textile production. Wheat and barley must have been introduced from elsewhere, but once irrigation farming was well-established (at least as early as the seventh millennium cal. BC), sizeable farming villages were a viable proposition without recourse to outside resources. Specifically and significantly missing among the local resources, however, are the types of raw material from which items of elite status normally derive, though these themselves are of course socially defined and we know from later sources that special kinds of textiles, for example, may have served such a function. In later periods quality textiles are well attested among Mesopotamia's many 'invisible exports' (Crawford 1973; Larsen 1987).

Thus the raw materials which are lacking in the south Mesopotamian environment are not those essential to everyday survival but those by which positions of power and elite status are acquired, expressed and reinforced. Moreover, already in the Mesopotamian neolithic (seventh millennium BC) such visible expressions of status were not uncommon, in the copper and lead trinkets of sites like Tell es-Sawwan and Yarim Tepe and in the widespread occurrence of semi-precious stone (*inter alia*, turquoise at Sawwan, Plate 4). In the absence of informative evidence we tend to assume that such small-scale objects were acquired via simple group to group exchange, but by the ᶜUbaid period there is a visible change in both organization and acquisitional behaviour which is significant in understanding the nature of early inter-regional exchange in Western Asia.

In the ᶜUbaid period there is evidence attesting increasing centralization and new forms of symbolic validation of social and economic relations: this can be seen in larger settlement size (ᶜUqair), the first identifiable monumental buildings (Eridu, Gawra), the first occurrence of large numbers of clay door and container sealings (Gawra, cf. Tobler 1950; Rothman 1988), a major administrative innovation with implications not only for the increasing receipt and despatch of portable goods, but also of the growth of 'authority' and perhaps even some form of central collection and redistribution. Comparable evidence has not yet been discovered in the south, but there we are poorly informed of this important stage in Mesopotamia's prehistory, owing largely to the difficulty of investigating early levels on major, long-occupied sites. There can be little doubt, however, about the increase in both overall settlement size and organization (Oates 1984; Henrickson and Thuesen 1989). Moreover, it is in this period that we see the first foreshadowing of the Uruk expansion, in the spread of southern ᶜUbaid material culture over the whole of

Plate 4 Alabaster figurine with turquoise necklace, from neolithic cemetery at Tell es-Sawwan, Iraq. Height c. 10cm, c. 6000 cal. BC.

Mesopotamia, an apparent cultural unity best exemplified at Gawra with its southern temples and ceramics, the latter largely locally made (Davidson and McKerrell 1980).

Most important in the context of this paper is new evidence from sites on the Upper Euphrates which seems to confirm the presence as far north as Malatya, across the Taurus, of at least one settlement which can best be interpreted as an ᶜUbaid 'outpost' (early fifth millennium cal. BC). Değirmentepe, now flooded by the Karakaya dam, lies some 27km north of Malatya, en route to Anatolian sources of both copper and silver (Esin 1983; 1985; 1989). By contrast with the local chalcolithic assemblage, both the house type (Esin 1988: fig. 2) and the painted pottery closely parallel contemporary examples from Mesopotamia. Moreover, material from the site includes the earliest and largest collection of stamp seals and clay sealings of this date from Anatolia; these are said to include door sealings, presumably from either private or public storehouses. ᶜUbaid pottery is also reported from the site of Arslantepe (Esin 1983: 187), and (rarely) at sites even further north in the Altınova plain. A major ᶜUbaid site has also recently been identified at Tell Abrᶜ, also on the Euphrates just south of Carchemish (Hammadeh and Koike, n.d.). Such sites confirm the Mesopotamian interest in Syro-Anatolia at this early date, but their precise social and economic relationship with the contemporary indigenous chalcolithic, and the 'Sumerian' south, remains to be ascertained.

Another ᶜUbaid expansion, often referred to in terms of 'trade', presents a very different picture. This is signified by the appearance of ᶜUbaid ceramics along the Arabian Gulf (Oates 1976; Frifelt 1989). By contrast with Anatolia these ᶜUbaid sites are ephemeral with few if any permanent structures. With the exception of a single group of sites in the area of Hofuf in the Eastern Province of Saudi Arabia they occur along the coast. Neutron activation, electron microprobe and thin section analysis of the painted pottery by which these sites are identified show an exclusive relationship with Sumer (Oates et al. 1977). None of the painted pottery clays resembles that of the local coarse ware, nor does pottery *per se* survive the ᶜUbaid presence. These ᶜUbaid ceramics cover a considerable period of time, and up to now none has been shown to be local. With the exception of the Hofuf sites, the pottery is not found inland, i.e. it does not appear within any local exchange network. Nor does it appear to have been copied. It would seem that these pots travelled with their owners, either for their contents or for their utilitarian value. There is no evidence that they were 'exchanged', and these Gulf data certainly do not support the view that 'maritime trade and transportation developed in the Persian Gulf as far as Bahrain since at least ᶜUbaid times' (Alden 1982: 624). At present they are most reasonably seen as representing seasonal exploitation, over a long period of time, by groups from southern Mesopotamia who presumably sailed down the Gulf (models of sailing boats were found in the Eridu cemetery, Lloyd and Safar 1948: pl. 5) and returned when weather and winds permitted. Whether the desired resources were types of fish and other marine life not found in the rivers of Mesopotamia, perhaps dried and carried back to Sumer (this could account for the different types of flints found associated with such sites, Frifelt 1989: 415), or more exotic items such as pearls, cannot be ascertained. What *is* clear is that this phenomenon does not parallel the ᶜUbaid expansion into Anatolia, and that 'exchange' is an unlikely interpretation. Unfortunately, as in all such studies, interpretation is constrained by the lack of non-perishable goods, likely to have constituted our most important evidence for exchange relations.

Thus in immediately pre-Uruk times two different kinds of evidence suggest the likelihood of deliberate 'outposts', either involved in local exchange networks or perhaps more directly in the production or acquisition of such elite commodities as copper, lead and possibly silver (gold is also reported by Woolley from a contemporary context at Ur (1931: 344); a context confirmed by the late Sir Max Mallowan), and of short-term sea-borne expeditions for the direct acquisition of marine commodities. At the same time in Mesopotamia itself social and economic developments clearly signal the beginnings of what was to culminate a millennium or so later in the Sumerian state.

Following the ᶜUbaid period there seems to have been a significant retraction from the widespread ᶜUbaid interactions, at least with respect to southern Mesopotamia. Many scholars have seen the later history of Mesopotamia as a recurrent cycle of centralization, expansion and collapse, and the visible contraction of southern material culture in the early Uruk phase may possibly represent the first such retraction. Within historic times periods of expansion are accompanied by increasing centralization and administrative reorganization (Akkadian, Late Assyrian), an observation perhaps pertinent also to the ᶜUbaid south. In the north, however, the contemporary late chalcolithic picture is not as circumscribed as the apparent loss of contact with the south might be thought to imply. The widespread distribution of certain quite distinctive ceramic types from the Altınova plain

(Norşuntepe) to Brak to Hamoukar to Gawra indicates a very extensive region of interaction (Hauptmann 1976: pls 49, 50: 1, 2; Tobler 1950: pls LXXIX, LXXXa, CXLV; Oates 1986: pl. 7; 1987: fig. 3: 6, 7; the cultivated fields and small tells just to the south-east of Hamoukar produce identical surface material, including unusually large channel rim vessels, found also at Brak and Gawra (pl. CXLV, 405, 406)). Indeed, at the end of this 'early Uruk' phase the cemetery at Gawra (level X) reveals some of the most persuasive evidence for social hierarchies known from this time. Moreover, clay sealings from sites like Gawra and Norşuntepe, now found largely in what appear to have been private houses, suggest the possibility not only of centrally administered but also more privately organized economic relationships. Later, shared symbolism is seen in the alabaster 'spectacle idols' of Brak (Oates 1985: pl. XXV), Hassek (Behm-Blancke et al. 1981: pl. 12: 5), el Kowm (Cauvin and Stordeur 1985: fig. 8: 1) and Sheikh Hassan (Boese 1989–90: 329).

Uruk expansion

Few archaeological discoveries in recent years have made more impact than the sites of Habuba Kabira Süd/Qannas and Jebel Aruda. At both sites not only the material culture – pottery, seals, sealings – but also the individual residential units are indistinguishable from those of southern Mesopotamia and in particular at the site of Uruk, previously our major source for the fourth millennium. The identity of material culture, ideology, accounting practices, use of space and building techniques render inconceivable any interpretation other than that the settlements at both Habuba and Jebel Aruda were built and lived in by south Mesopotamians. Both settlements were short-lived (100–150 years at most, perhaps considerably less); both were abruptly abandoned. The presence of monumental temples at Jebel Aruda and the essentially secular structure of Habuba suggest a difference of function for the two sites, which is reinforced by differences in the bureaucratic paraphernalia, including the clay tokens, bullae, other sealings, and the seals themselves (Strommenger 1980; van Driel 1983). No agricultural tools were found, and food was apparently acquired from local farmers (attested by the large storage jars said to constitute the only local pottery present). The construction of a massive wall in the second building phase suggests that local relations may not have been entirely peaceful, though it is possible that the wall served only to protect the valuable commodities, the collection of which is likely to have been the site's basic purpose – or that it may have been entirely symbolic. The presence of an earlier walled settlement at nearby Tell Sheikh Hassan (below) remains equally unexplained; there is little evidence for 'conflict' either here or in Sumer at this time (Fig. 2).

Since the discovery of Habuba Süd and Jebel Aruda, a number of contemporary sites have been identified in both Syria and Anatolia, which display various degrees of relationship with the Uruk south (or with Habuba/Aruda?). Some have been excavated, some identified solely by their surface remains. Such sites have been classified as 'colonies' or 'enclaves', 'outposts', i.e. smaller sites that show a close correlation with Uruk, and Uruk-related sites (Algaze 1989; Sürenhagen 1986), many of the latter solely on the dubious basis of the presence of bevelled rim bowls (Plate 1), the earliest of the

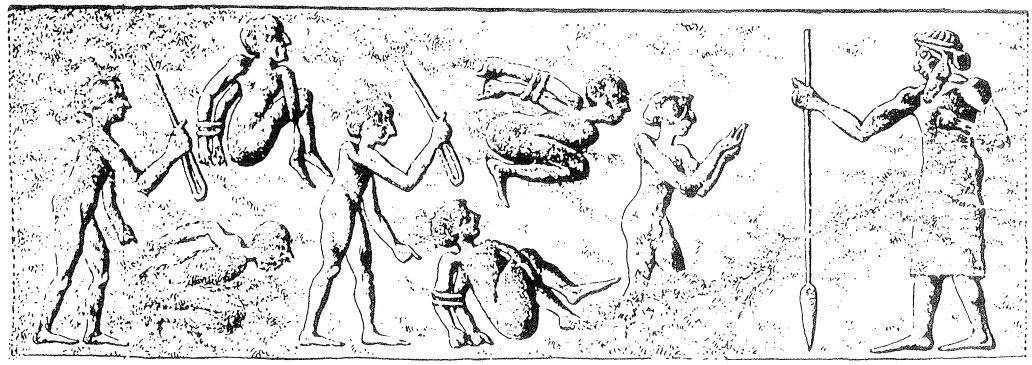

Figure 2 Evidence for conflict is rare in Late Uruk Mesopotamia, and seen largely in a small group of seal impressions from Warka which illustrate the taking (? or torture) of prisoners (cf. Brandes 1979: pls 1–13). In Sumer known city walls are of Early Dynastic date (but see now Pollack et al. 1991: 63). (After Brandes 1979: plate 1.)

'mass-produced types' widely used at this time, the purpose of which continues to elude us. Whether they were ration bowls, associated with a centralized administration, or (most recently) containers for baking bread (Millard 1988; Chazan and Lehner 1990), remains an unresolved question, but their presence *alone* does not signify more than contact with what had by then become a widespread system or technique. Nor do they necessarily signify a Late Uruk date (Oates and Oates 1991). At Tell Sheikh Hassan such vessels were found set into fireplaces (Boese 1986–7: 74). Of the 'outpost' sites undoubtedly the most informative is Hassek Höyük, an isolated small settlement some 260km beyond Habuba, at an important Euphrates ford which provided access to the Taurus some 20km beyond (Behm-Blancke et al. 1981, 1984). The major building and its contents are of southern Uruk types; even the use of cone mosaic wall decoration is attested (Behm-Blancke 1989).

This Uruk expansion has been seen in terms of a variety of models, most recently and comprehensively in terms of 'centre and periphery' (Algaze 1989). The acquisition of raw materials remains the common sense motive, but it must be emphasized that no single shred of evidence attests any form of 'trade'. The evidence for bureaucratic organization is overwhelming; what is less clear is what was being organized. Moreover, evidence for industrial activity associated with the essentially 'Uruk' sites (e.g. Canaanean blade production at both Hassek and Brak, Plate 5) illustrates the production of tools for which there is no evidence whatsoever in the south. Evidence for metalworking is found at sites beyond the Taurus, at Değirmentepe as early as the ᶜUbaid levels (Esin 1989: 137) and at Tepecik and Norşuntepe, close to the Ergani mines (Hauptmann 1982: 60–1), and includes silver and possibly iron (?ore) (Brandt apud van Loon 1978: 61–2). But there is neither overwhelming evidence for the acquisition of metals at Uruk-related sites in the north nor for the consumption of large quantities of metal status objects in the south. This statement must, of course, be qualified by two facts, that metals can be melted down and reused, and that we have failed to find the major cemeteries of fourth millennium BC Sumer, where one would expect to find large repositories of such elite items. Certainly there was a developed, technically advanced, local metallurgy in Anatolia, its products including

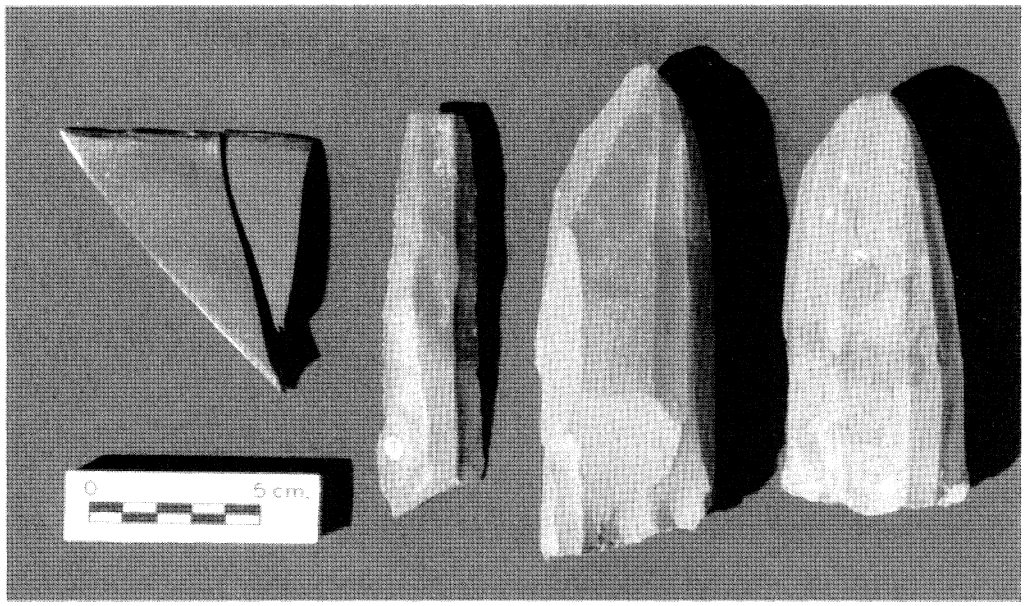

Plate 5 Late Uruk tabular flint, Canaanean blade and flint cores from Tell Brak, Area TW level 12. An obsidian core weighing over 2kg was found with these objects (cf. Behm-Blancke et al. 1981: pl. 14; 1984: pl. 5: 3; Strommenger 1980: fig. 45).

silver-inlaid daggers, and an increase in the quantity of copper/bronze found on sites in Sumer (Moorey 1985; Adams 1981: 80; Palmieri 1981; 1985). What we lack is actual evidence that one purpose of sites like Habuba was to acquire such objects or raw materials for southern consumption. Yet the notion persists, and indeed on the geography of settlement distribution seems overwhelmingly persuasive, that the pursuit of metals must have played a major role in the Uruk presence in these distant areas. Habuba may also have served as a transshipment centre for timber from the Amanus, an historically attested source. Nor should we forget that the wealth of the Syrian steppe even today lies in its flocks and herds, and that wool was the basis of later Ebla's prosperity, 'an empire built on the backs of simple shepherds' (Gelb 1986: 158).

The impressive 'administrative' evidence from sites like Habuba and Jebel Aruda, and indeed from indigenous sites like Arslantepe (Frangipane and Palmieri 1988), a type of activity attested in the north as early as the ᶜUbaid period, suggests a high level of organization but not necessarily regional centralization even in Sumer. Though in the Arslantepe levels attributed by the excavators to the Late Uruk phase the thousands of sealings seem to have derived from public buildings. Uruk is often seen as a, if not the, major central place, but this is an assumption based on the fact that most of the evidence comes from Uruk and is much influenced by that city's extraordinary monumental precincts and the fact that it remains the sole source of early writing. We are for the most part uninformed of the nature of contemporary Sumerian sites.

To this Syro-Anatolian reconstruction, currently seen in terms of a short-lived phenomenon the collapse of which accelerated a structural shift in Sumer, can be added the new evidence from Tell Brak, summarized above (p. 406), and from the site of Tell

Sheikh Hassan. At the latter site seventeen levels of southern materials have been excavated, now dated earlier (?Middle Uruk) than Habuba and the Late Uruk phase at Brak. Crucial to this earlier dating are certain very characteristic and distinctive ceramic types which do not occur at Habuba, *inter alia* long-handled ladles (Boese 1986–7: fig. 34) and conical cups with pouring lips (Sürenhagen 1986: 31–2; 1978). Similar pottery is reported from sites such as Qraya, well south of Habuba near the Euphrates-Khabur junction, and at Kowm 2-Caracol, situated on the steppe/caravan route at the western end of Jebel Bishri, south of Raqqa (Sürenhagen 1986; Cauvin and Stordeur 1985: fig. 6: 2). Also important at Sheikh Hassan is evidence for the use of bullae and tokens, and cylinder seals, which must significantly pre-date their present earliest attributions in the south (level 10, Boese 1986–7: 77, figs 36–9). Sadly, the earliest levels of this important site are now lost beneath the waters of Lake Assad (Boese 1987–8: 159).

Comment

Whatever interpretations are placed on these widespread cultural interactions, present evidence indicates that the pattern began at least as early as the ᶜUbaid period. Curtin's 'trade diaspora' (1984), the establishment of communities specifically for the purpose of mediating exchange relations between areas of different resource potential, offers one possible model (see Algaze 1989). According to Curtin 'trading settlements' tend to be directly involved in the exploitation of local resources, and therefore widely dispersed, when the local networks are relatively underdeveloped, a pattern with which Değirmentepe seems to conform (across the Taurus and near the actual ore sources). Present data are inadequate for any assessment of the degree to which such settlements were in direct relationship with the south, though one must suspect that major northern ᶜUbaid sites like Brak and Samsat or Carchemish may have played important mediating roles. Indeed it is in this context that the persistence after the apparent ᶜUbaid 'collapse' of a northern interaction zone should be seen (Norşuntepe – Brak – Hamoukar – Gawra).

For ᶜUbaid Mesopotamia itself present evidence suggests different kinds of exchange phenomena and the necessity of a variety of models, geographically differentiated. In the Gulf, for example, trading 'outposts' of Değirmentepe type are lacking; a different mode of direct resource exploitation seems to have been involved, based on intermittent and impermanent Sumer-based intrusions, perhaps more a factor of environmental than organizational conditions. The widespread identity of ᶜUbaid cultural material throughout northern Mesopotamia, and as far west as the Euphrates (Tell Abrᶜ) remains to be satisfactorily explained. Flannery's emulation model, as applied to Olmec–Oaxacan relations, provides many insights, in particular that Olmec influence was probably strongest in those areas that were already most developed and that already had status systems into which Olmec concepts could profitably be fitted. Emulation of Mesopotamian administration and religion makes sense only if local elites derived increased status, and thereby power, from their role as mediators in this contact. Indeed the adoption of southern public institutions (the temples at Gawra) has been seen as a northern assimilation of a southern means of consolidating restricted access to the means of production (Forest 1983). Purely demographic models have also been proposed, but the

simple fact is that our data are inadequate for more than speculative assessments. It seems clear, however, that the northern ᶜUbaid 'acculturation' is of a different degree from that of any other period in Mesopotamian history. (Without written documentation, evidence of the Akkadian Empire at Brak, one of its provincial administrative centres, would be attested solely in the iconography of a few clay sealings!)

To return to Curtin's model, it would seem that trading settlements are more likely to be established at focal transport nodes in situations where local polities already control developed networks (the latter perhaps to be seen in the post-ᶜUbaid, indigenous, northern, interregional contacts). Late Uruk locations, e.g. Habuba/Qannas, dominating – as did Meskene in later times – the traditional Euphrates terminus for access to the Mediterranean [and note the increasing evidence for contact with Egypt, perhaps via this route, Sürenhagen 1986: fig. 24; Moorey 1987; 1990; von der Way 1987], and Hassek Höyük, sited where the Euphrates route crosses the Taurus, may perhaps be interpreted in this context. Brak and Hamoukar control alternate routes northwards from the Tigris Valley and the Mesopotamian Jazirah, but these are not colony sites. Both were indigenous sites of urban proportion, and controlled prime agricultural land. At 90ha Hamoukar bevelled rim bowls have been found, but no other southern Uruk pottery has yet been reported. The local, largely chaff-tempered, late chalcolithic ceramics known from Brak and Hamoukar are also widely recorded, from Nineveh and Hawa in the east to the Karababa basin in the west (Kurban Höyük, Karatut Mevkii), clear evidence of widespread northern social and economic interactions at this time.

A new feature is the certain identification of southern Jamdat Nasr materials at Brak. This evidence not only prolongs the period of Late Uruk contact, but its absence elsewhere implies some structural reorganization. The reasons for this are undoubtedly complex, but a number of authorities remark on the appearance at this time north of the Taurus of a 'red-black burnished ware' of certain East Anatolian/Transcaucasian origin (Hauptmann 1982; Palmieri 1985). Both the frontiers and the local structure of the fourth millennium exchange systems now change, and it is possible that Brak, with at present the sole evidence for genuine southern contact, served as a (?the) major north–south organizational centre. To the north-west, the so-called 'colonies' had been abandoned (as was Late Uruk TW level 12 at Brak); indeed Hassek Höyük, closer to the Taurus, was destroyed. Moreover, at the Anatolian sites there is no longer evidence for central redistributive institutions (Palmieri 1985: 208). Remnants of Late Uruk cultural tradition persist in what is referred to as the 'late reserved slip ware' horizon, with a distribution at the very western margins of the former interaction zone (Tepecik, Arslantepe, Hassek). At Tepecik an 'isolated outpost' calls to mind the lone administrative building at Godin Tepe in the Iranian Zagros (Esin 1982a; 1982b; Weiss and Young 1975). Often described as 'late-Uruk-related', owing in part to the presence of bevelled rim bowls now known at Brak significantly to post-date the Jamdat Nasr horizon, it is likely that these 'late reserved slip ware' sites are contemporary with a post-Uruk, early bronze horizon which can be shown at Brak to pre-date the earliest Ninevite 5 (Oates and Oates 1991). Of interest is the apparent evidence for decentralization at the Anatolian periphery, despite the wealth and centralized administration of the Late Uruk contact phase, perhaps an indication of the degree to which the local emergent elite had become dependent on the earlier exchange relations, now lost or significantly altered.

Conclusions

From the Late ᶜUbaid period onwards there is evidence for significant social change in Sumer itself, with the establishment of public institutions and increasingly wealthy elites. With the exception of Uruk and its vast monumental complexes the archaeological evidence for both the nature and the organizational activities of these institutions now comes largely from outside Sumer, in particular in the context of the so-called colony sites. This paper has emphasized both the essentially social role played by the commodities of which the acquisition seems logically to have been at least one major motivating force in the establishment of the ᶜUbaid and Uruk 'networks', yet, perversely, the virtual absence of direct archaeological data for any form of trade or exchange. Such evidential problems are even more clearly illustrated in the historically attested Cappadocian trade, organized from the city of Assur (Larsen 1987). The latter family-based enterprises, however, are unlikely to provide a suitable model for the extraordinary organizational capacities and capabilities implied by the mere existence of fourth-millennium BC sites like Habuba and Jebel Aruda, and no doubt many more about which we are less well-informed (Carchemish, perhaps, and Samsat, now flooded). The paper has also emphasized the ᶜUbaid roots of this long distance pattern, and the persuasive evidence for a highly developed and distinctly northern region of interaction from ᶜUbaid times onward. Indeed, in the ᶜUbaid and Uruk periods the north is characterized by an elaboration of administrative paraphernalia as yet unparalleled in the south before the Late Uruk period, and it must remain a possibility that the very specialized use of sealed clay bullae as record of receipt and dispatch may have originated within this northern inter-regional system. [The earliest string-attached, sealed bullae yet discovered come from Halaf Arpachiyah (Mallowan 1935: pl. IX, b; von Wickede 1990: 54–66)].

These observations raise again the question of the role of long-distance trade in the growth of primary states. In the context of Varna Renfrew has emphasized the interrelationship of production and exchange, the circulation of goods of 'prime', i.e. 'ascribed intrinsic' value and the emergence of prominent social ranking, and suggests that the key to complex development may lie in technical advance which ensures new kinds of demands, not merely the (unprofitable) circulation of existing goods (1986: 159; see also Brumfiel and Earle 1987). In the specific context of ᶜUbaid Mesopotamia's undoubtedly 'prosperous and increasingly stratified agricultural society' (Yoffee 1981: 23), the lack of elite commodities such as metals and rare stone is likely to have stimulated both the demand for exotic items and the organization essential to their procurement. The geographical location of 'trading' outposts at this time and the associated evidence for metal-working at sites north of the Taurus makes plausible such an assumption despite the minimal artefactual evidence from Sumer. What was exchanged *from* Mesopotamia, or whether coercion was a factor of any significance, cannot be ascertained from the essentially negative evidence of prehistory. Later historical parallels suggest that south Mesopotamian manufactured goods may have been in high demand, and stress the role of booty (T. F. Potts, this volume). At no time is there evidence for the extensive export of grain (cf. also D. T. Potts, p. 424), which would have created tremendous logistical problems. Indeed surplus production would more logically have been used to support the southern craftsmen and administrators behind the system we have been examining.

Moreover, the evidence for craft specialization dates well back in the neolithic (Oates 1977) and by the time of the earliest written texts, a hierarchical arrangement of terms relating to crafts and professions is evident (Nissen 1974: 12–14).

One further point remains to be emphasized. The perception of Near Eastern distances is difficult in the age of the aeroplane. Yet 'an understanding of the importance of distance leads one to view in a fresh light the problems of administration' (Braudel 1975: 371). The minimum direct travel time from Uruk to Habuba along the shorter Jazirah route would have been at least a month, more likely two (Grant 1937: 171 (figures for faster camel caravans)), and it is another 400km to sites like Değirmentepe, a destination, moreover, that requires crossing the Taurus. One of the extraordinary features of the phenomena we have been examining is the consistency of artefactual materials from the 'colony' sites and their southern homeland. Such statements obviously demand further quantitative examination, but much of the relevant data is only recently excavated. Even the degree to which the northern ᶜUbaid and Uruk pottery is imported or locally manufactured remains to be ascertained (ICPES analyses are being carried out at present on southern Uruk types from Brak), but it is clear in some instances that the Late Uruk fabric is identical at Uruk, Brak and Habuba (for example in the very recognizable 'soft' brown clay of the red-slipped nose-lug jugs (Strommenger 1980: pl. D)). Despite the distances involved, the degree to which identical materials are found at these sites, whether locally made or imported, and over the now more lengthy period of time represented by Shaikh Hassan, Habuba and Jamdat Nasr Brak, suggests that direct and regular contact was maintained with the south. How early the donkey caravan came to play a role is uncertain, but may be suggested indirectly by the use of the steppe route at Middle Uruk Kowm-Caracol (see also Zarins 1978).

Whether the southern terminus was represented by Uruk alone, a degree of centralization for which the evidence is largely negative, or by competing polities on the Early Dynastic model, or by some version of Jacobsen's 'Kengir League' (1957: 99–109) remains to be established, though the latter receives some support in the evidence of the Jamdat Nasr 'city sealings' (Matthews, in press). It has been argued that the assumed Late Uruk loss of Anatolian raw material sources may be reflected in the restructuring visible at Jamdat Nasr Warka (Eanna archaic III), but the new evidence from Brak indicates an active though more probably restricted Jamdat Nasr presence in the north, associated with significant restructuring within the distant Anatolian metal-producing areas. The fact that long distance exchange relations with this area can now be shown to begin as early as the ᶜUbaid period, and to continue throughout most of the fourth millennium, must add strong support to the view that asymmetrical cross-cultural trade was one important factor in the growth of the Sumerian state.

Acknowledgements

I am very much indebted to Johannes Boese for his kind permission to examine the Sheikh Hassan material in Saarbrücken; to Dietrich Sürenhagen for many useful discussions and much unpublished information; and to Roger Matthews and Alan Lupton for their assistance in the excavation and identification of the new material from Brak. I would also

like to thank Roger Moorey and Andrew Sherratt for their helpful comments on the first draft on this paper.

Abstract

Oates, Joan

Trade and power in the fifth and fourth millennia BC: new evidence from northern Mesopotamia

The formation of the earliest known cities was accompanied by the foundation of colonies in Syria and Anatolia, established to secure raw materials lacking in the Mesopotamian homeland. The growth in Sumer of organization(s) capable of constructing and administering such distant colonies both reflected and contributed to increasing levels of social and economic complexity. The paper summarizes new evidence from Tell Brak and Tell Shaikh Hassan, which substantially lengthens the colony period. It also emphasizes the ᶜUbaid roots of this pattern.

Abstract

Over the last few centuries, the ancient Greeks and their systems of government have been held in high esteem as they are routinely treated as the direct precursors to modern western democracies. For example, the contemporary historian Wilfried Nippel writes:

> Nowadays democracy is an unambiguously positive norm… it is a reminder of the great Athenian experiment and invites comparison with the inventers of this order. Athens remains contemporary… it is seen as a flame pointing to the future that has warmed the hearts of countless numbers of men and women striving for autonomy and self-determination.[1]

While such statements remain common in modern scholarship and political discourse, researchers rarely seem to consider whether the Greeks and their political institutions were truly unique in antiquity or if other people were also developing broad-based governments at around this time.

My research here intends to challenge some of these Hellenocentric oversights by demonstrating that the Phoenicians were another Mediterranean civilization in antiquity that developed broad-based oligarchical governments. In fact, my thesis will demonstrate that the trend of establishing broader, more collective systems of rule appears to have begun several centuries *earlier* among the Phoenicians than the Greeks. From this, I will argue that the origins of broad-based non-monarchical forms of government lie, not with the ancient Greeks and the institutions they developed over the course of the Archaic Period, but with the Phoenicians and the governments that existed in their city-states from as far back as the late Bronze Age. I will also argue that because the Phoenicians began this process of broadening their governments earlier, had political systems that were quite similar to the ancient Greeks', and were in constant

[1] Wilfried Nippel, *Ancient and Modern Democracy: Two Concepts of Liberty?,* trans. Keith Tribe (New York, NY: Cambridge University Press, 2016), 359.

contact with the Hellenes at this time, perhaps the Phoenicians and their governments in some ways inspired the political developments of the Archaic Period. By doing so, I will advocate that modern researchers should perhaps focus less on the ancient Greeks and more on the Phoenicians when discussing the origins of democracy, or at the very least, concede that the history of broad-based governments is far older and more complicated than is generally assumed.

Acknowledgments

I would like to, first and foremost, give a huge thanks to my two supervisors, Dr. Marica Cassis and Dr. Frances Pownall, for all of their hard work and help on this thesis. Marica Cassis is a professor who has been cultivating my interest in history and studying the ancient world ever since the first year of my undergraduate degree at Memorial University of Newfoundland, back in 2016. Over the years, the numerous courses she has taught me and the many conversations we've had have provided me with invaluable information, especially on the ancient Near East, which has proven tremendously helpful in writing this thesis. Dr. Frances Pownall, on the other hand, is a professor with whom I am more recently acquainted. We first got in contact with each other in the summer of 2021, when she graciously decided to accept me as her student and agreed to co-supervise this project. Ever since, she has been nothing but constructive and insightful, especially in helping me research the political developments of archaic Greece, for which I am extremely grateful.

In addition to my two supervisors, there are some other scholars whom I would like to acknowledge. I want to thank all of the professors at the University of Calgary who taught me courses in Greek and Roman Studies during my time here as a graduate student, whose knowledge and expertise helped lay the groundwork for this thesis. I also want to thank the University of Arkansas' Dr. Daniel Levine, who led a seminar at the American School of Classical Studies at Athens in the summer of 2022, that I was fortunate enough to have attended. There, Dr. Levine reinvigorated my passion for ancient history and provided me with some key firsthand experience of Greece and its material culture (including at a number of the locations discussed in this work, such as Athens, Corinth, Crete, the Peloponnese, Lefkandi, and more).

Finally, I would like to thank my friends and family for their incredible support as I have been working on this project and completing my master's degree. I am grateful for my fellow graduate students here at the University of Calgary and the encouragement they have provided me to keep pushing onward and work towards my ultimate goals. I would also like to specifically thank my parents, Ed Vanderkloet and Catherine Deboer, as well as my partner, Brianna Cranford, for sticking by my side and supporting me throughout this entire process.

Chapter 1
Introduction

Over the course of the Archaic Period, which lasted from around 800 to 480 BC, ancient Greek society undoubtedly experienced some major changes and developments. At this time, many of the small villages scattered throughout Greece that had survived the Bronze Age Collapse began unifying through the process of *synoikism* to form larger city-states and consolidate the surrounding countryside into their territory. Cooler and wetter climate conditions seem to have given rise to dramatic changes in the demographics of Greece as the population of the region appears to have doubled over the course of the 8th century BC alone.[2] During the Archaic Period the Greeks also made significant advances in the art of war as they began developing the phalanx formation and hoplite warfare, two things that allowed them to serve as valuable mercenaries in the armies of contemporary civilizations, that helped them repel the Persian invasions of the early 5th century BC, and that they would ultimately continue to make use of throughout antiquity until their eventual demise at the hands of the Romans in the 2nd century BC.[3] Although they were divided into numerous states and polities, the Greeks do appear to have established a broader sense of cultural identity in the Archaic Period as they created festivals, games, and sanctuaries of panhellenic importance. These sanctuaries included places like Apollo's oracle at Delphi or Zeus' temple at Olympia, which were frequently consulted by visitors from throughout the ancient Greek world, especially during the quadrennial festivals, the Pythian and Olympic Games respectively. As the Archaic Period progressed, the Greeks also engaged in new art forms such as lyric poetry, theatre, philosophy, geography, and more.

Unlike in the immediate aftermath of the Bronze Age Collapse, during the Archaic Period the Greeks began to increasingly engage in long-distance trade with the broader Mediterranean. This allowed the Greeks to come into closer contact with other cultures, from whom they were able to adopt various technologies and innovations. The civilizations that the Greeks were perhaps the most indebted to in this regard were those of the contemporary Near East, particularly the Phoenicians, a maritime people from modern-day Lebanon who played a crucial role in re-establishing trade between the Aegean and eastern Mediterranean.[4] As the Roman orator Cicero once said, "The Phoenicians were the first, through their trading and merchandise, to import into Greece greed and grandiosity and the insatiable desire for all things."[5] The presence of Phoenician pottery, jewels, and an inscribed bronze bowl from the Tekke cemetery suggest that Phoenician traders were visiting the island of Crete and engaging in commerce there since at least the 10th century BC.[6] In fact, some Phoenician craftsmen seem to have stayed on the island and resided there permanently, as evidenced by the fact that the Phoenicians appear to have built a shrine, known as Temple B, in the Cretan port city of Kommos in the late 9th century BC.[7] In addition to the island of Crete, the Dodecanese islands of Cos and Rhodes appear to have had a strong connection with the Phoenicians as well. The presence of Phoenician wares and burials, such as the Phoenician child burial discovered at Ialysos, suggest that Phoenician merchants were visiting these islands and trading with their inhabitants since at least the 9th

century BC.[8] From the 8th century BC onwards, the islands of Rhodes and Cos appear to have stopped importing ceramics in such high quantities from the Near East and instead began producing local imitations of Cypro-Phoenician pottery, especially Black-on-Red ware juglets. This has led scholars to conclude that by the 8th century BC, Phoenician craftsmen had established permanent workshops on Rhodes and Cos for the bottling and selling of perfumes, oils, and other unguents.[9] Our surviving literary sources written by the ancient Greeks themselves only further corroborate the Phoenicians' early presence in the Aegean as they claim that the Phoenicians had established a presence on several islands, such as Thasos and Cythera, before the Greeks ruled there.[10]

In addition to the Aegean islands, the Greek mainland appears to have developed a growing connection or relationship with the Phoenicians at this time too. For example, from the 7th century BC onwards, Greek coins and vases increasingly depict chickens on them and various Greek authors make references to these birds in their written works.[11] This is significant, as the Phoenicians are believed to have ultimately introduced this species of livestock to the region by transporting them from the Near East aboard their ships, given that the earliest remains of chickens in Europe seem to all come from Phoenician sites, especially their colonies in Iberia.[12] At this time, large quantities of Phoenician goods seem to have also made their way into mainland Greece, even into the area of Laconia, which is surprising considering that this was an

[12] Lee Perry-Gal et al., "Earliest Economic Exploitation of Chicken Outside East Asia: Evidence from the Hellenistic Southern Levant," 9849.

especially insular region of Greece due to the fact that its major city, Sparta, was landlocked and prohibited its citizens from engaging in commerce.[13] Archaeological surveys at the port city of Gythium in Laconia have led to the discovery of a large number of murex shells, which has caused scholars to believe that in the early Iron Age, this city was heavily involved in the Phoenician trade of purple dyes.[14] Similarly, a number of Phoenician carved ivories and terracotta masks dating to the 8th century BC have been discovered at Artemis' sanctuary at Orthia, suggesting that by the early Archaic Period, the Lacedemonians were engaging in long-distance trade with the Near East.[15]

Of course, at this time commercial goods not only made their way from the Near East to Greece, but from Greece to the Near East as well. For example, from the late 9th century BC onwards a number of Greek ceramics, especially of Euboean origin, appear to have been exported to the trade post of Al Mina situated along the northern coast of the Levant, from which they were distributed throughout the Near East and were brought as far inland as the Neo-Assyrian capital of Nineveh.[16] The close trade connections between the Phoenicians and Greeks (especially from the island of Euboea) seem to be only further corroborated by the archaeological evidence suggesting that the Greek ἄποικος or 'colony'[17] of Ischia, which was founded by settlers from the Euboean cities of Chalcis and Eretria in the late 8th century BC, was also inhabited by a number Phoenicians in its early history.[18] Because of these various interactions

between the Phoenicians and Greeks in the early Iron Age, by the time the Homeric epics were produced in the 8th century BC, the Phoenicians appear to have already had a well-established reputation for producing high-quality goods and for trading these goods in ports all over the Mediterranean.[19]

As the Greeks increasingly interacted with the Phoenicians, they seem to have adopted a number of Phoenician innovations and ideas. For example, it was from the Phoenicians that the Greeks adopted their script, which allowed them to produce a variety of written works in the Archaic Period just like they had previously done in the Bronze Age.[20] Furthermore, as the Archaic Period progressed, the Phoenicians seem to have greatly influenced Greek art and religion. For example, a number of scholars have demonstrated that over the course of the Archaic Period, Greek pottery seems to have been increasingly influenced by contemporary Near Eastern motifs as the Greeks shifted away from using geometric designs in favor of depicting human beings, wild animals, mythological creatures, and floral designs, especially ones with palmette volutes.[21] Meanwhile, researchers like Walter Burkert have demonstrated significant parallels between Greek and Phoenician gods such as Aphrodite/Ashtarte, Apollo/Resheph, Heracles/Melqart, as well as Greek and Phoenician forms of divination in antiquity.[22] The Phoenicians appear to have also had a profound influence on Greek seafaring and navigation.

From the 6th century BC onwards, the Greeks seem to have abandoned the practice of sewing the planks of their ships together in favour of using pegged mortise and tenon joints.[23] Considering that mortise and tenon joints have a far older history of use in the ancient Near East, have been observed in Phoenician ships dating back to the late Bronze Age such as in the Uluburun and Cape Gelidonya shipwrecks, and were known to the Romans simply as *Punicanis coagmentis* or 'Phoenician joints',[24] scholars believe that this shipbuilding technique must have been adopted by the Greeks from the Phoenicians.[25] It is likely that the bireme, a ship with two banks of rowers on each side for increased speed and maneuverability in naval warfare, was another Phoenician invention that was adopted by the archaic Greeks as our earliest depictions of these ships come from Neo-Assyrian portrayals of the Phoenicians and their navy during the reign of King Sennacherib (705-681 BC).[26] Overall, the influence from the Near East, particularly the Phoenicians, over the Greeks at this time was so prevalent that 20th century scholars decided to coin this era of Greek history, "the Orientalizing Period."

Out of all of the developments that occurred in Greece during the Archaic Period, perhaps the most noteworthy are the political changes that a number of Greek city-states experienced. At this time, many foundational laws and institutions were established within Greek cities that persisted well into the later Classical (479-324 BC) and Hellenistic Periods (323-31 BC). For example, the Spartans appear to have undergone drastic legal reform in the early Archaic Period which they attributed to Lycurgus, a shadowy figure who was revered as one of

the city's major founders. Meanwhile, we hear that Athens experienced similar legal reforms under their famous lawgivers Draco and Solon in the late 7th and early 6th centuries BC respectively. As the Archaic Period progressed and these various legal reforms were implemented, Greek cities seem to have gradually reduced the power of their kings and, in many instances, outright abolished their monarchies in favor of broader oligarchical political systems. In the case of Athens, for example, this led to the creation of its 'democracy' in 508 BC.

This trend of overthrowing monarchies and replacing them with broader, more collective forms of government seems to have been considered one of the defining traits of the ancient Greeks and something that ultimately distinguished them from contemporary civilizations. In his *Politics*, Aristotle calls hereditary kingships 'barbarian monarchy' and contrasts this with what he classifies as 'Spartan kingship,' where the monarch seemingly holds the least amount of political power.[27] This suggests that Aristotle drew a distinction between the Greeks, who are constantly striving to reduce the power of their kings, and 'foreigners' (βάρβαροι), who are more complaisant towards monarchy. Aristotle's teacher, Plato on the other hand, does not seem to have considered monarchies a 'Greek' form of government at all in his *Republic.*[28] Similarly, in Herodotus' *Histories,* when King Xerxes of Persia, in preparation for his invasion of Greece, asks the former Spartan king, Demaratus, to summarize the Hellenes as best he can, he defines them as a people who are constantly (διαχρεωμένη) fighting off both poverty (πενίην) and despotism (δεσποσύνην).[29] Likewise, Hippocrates in his work, *Airs, Waters, and Places* claims

[27] Aristotle *Politics* 3.1285a-b.

that the reason why the 'Asian race' (γένος τὸ Ἀσιηνὸν) is more cowardly than the Hellenes is because much of Asia (τῆς Ἀσίης τὰ πολλὰ), unlike Greece, is ruled by kings (βασιλεύεται).[30]

This Hellenocentric view that the ancient Greeks were the sole innovators of democracy and were in many ways unique or exceptional, continues to be perpetuated in modern scholarship and political discourse. Books written on the topic of democracy and its history often begin by discussing the ancient Greeks and the reforms of Cleisthenes in 508 BC.[31] Throughout his term as the British prime minister, Boris Johnson kept a bust of the 5th century Athenian politician, Pericles in his office and frequently referred to this figure in his political speeches on the nature and origins of democracy.[32] The present-day constitution of the European Union even begins with a preamble that quotes directly from Pericles' funeral oration delivered in the winter of 431 BC, "Our constitution … is called a democracy because power is in the hands not of a minority but of the whole of the people."[33] This notion that ancient Greek governments were the direct precursors to modern democracies remains quite prominent in contemporary American political discourse as well. For his last trip overseas as president in November of 2016, Barack Obama travelled to Greece and delivered a speech in which he declared "we're indebted to Greece for the most precious gifts – the truth, the understanding that as individuals of free will, we have the right and capacity to govern ourselves."[34]

While the history of the ancient Greeks and the abolishment of their monarchies in favour of broader, more collective systems of government is a much-discussed topic in modern scholarship and political discourse, researchers rarely contemplate whether the Greeks were truly unique in this regard or if other civilizations in antiquity were also developing oligarchies at this time. Simon Hornblower is one rare exception as he does, at the very least, consider the possibility that Athenian democracy was inspired by the Phoenicians who were also developing collective systems of rule at around this time.[35] Nevertheless, Hornblower only ponders this point very briefly in his work before quickly moving on to discuss the Greeks and their contributions to democracy, saying little more than "The Phoenicians, in western Asia, had something comparable to the self-regulating city-state or *polis* of archaic and classical Greece… the Greek political arrangements we most admire. Scientific study in this area has, however, hardly begun… we can do no more than mention the Phoenicians and move on."[36]

My thesis here will attempt to amend some of these shortcomings in modern scholarship surrounding the ancient Greeks and the development of their political thought over the course of the Archaic Period. After providing a brief outline of my research methodology (Chapter 2), I will first summarize our surviving evidence of monarchies in ancient Greece, from when the Greeks first appear in the archaeological record during the Bronze Age, to the Archaic Period, the main period of focus in this paper (Chapter 3). Then, I will discuss how the Greeks appear to have gradually reduced the powers of their kings or abolished their monarchies in favour of broader political systems. I will do this by focussing specifically on the histories of Corinth

(Chapter 4), Sparta (Chapter 5), and Athens (Chapter 6) during the Archaic Period and discussing the various political changes that these three city-states each underwent at this time, according to our various ancient sources and other evidence. Finally, I will discuss the history of the Phoenicians from the late Bronze Age to the 5th century BC and how they too, appear to have gradually reduced the powers of their kings in favour of establishing broader, oligarchical political systems in their city-states (Chapter 7). In this final chapter, I will not only draw comparisons between the forms of government that existed among the Phoenicians and Greeks, but will demonstrate that the trend of establishing broader, more collective systems of rule began several centuries *earlier* in Phoenicia than in Greece. By doing so, I will speculate that the political developments of archaic Greece were in some ways inspired by the Phoenicians and their oligarchies. The purpose of this thesis is not to lessen or discredit the Greeks' contributions to the development of democracy, but rather to argue that the history of broad-based governments is much older and far more complicated than is generally assumed. Furthermore, my thesis is meant to demonstrate that it is perhaps more fruitful to study the ancient Greeks and their political developments – not in isolation as though this civilization existed in a vacuum – but within their appropriate context and in conjunction with the other civilizations of the Mediterranean, with whom the Greeks were in close contact.

Chapter 2
Methodology

To begin, it is important to state that my approach to this work has very much been a multidisciplinary one. My research does not simply focus on the ancient Greeks and their political developments in isolation, but studies them in conjunction with the other civilizations of the ancient Mediterranean with whom the Greeks were in close contact and who were also experiencing substantial political changes at this time. The Phoenicians are, of course, the main civilization that I will be comparing to the Greeks and their political developments over the course of the Archaic Period. However, I will also make mention of other cultures, such as the Romans, Egyptians, and Arameans, on occasions where their histories or politics are relevant to the discussion and help illuminate broader trends of the period.

Moreover, I have taken a multidisciplinary approach in terms of the variety of sources that I have made use of in this work. As evidence for my arguments, I have tried to draw from a range of source material, including archaeological remains, inscriptional evidence, ancient literary works, modern scholarship, and more. I have also tried to capture both insider and outsider perspectives on the political developments that city-states experienced at this time. So, for example, when I recount the history of the Phoenicians from the late Bronze Age to the 5th century BC (Chapter 7), I will not only discuss what the Phoenicians themselves have left behind or revealed about their political systems, but will demonstrate what the neighbouring Assyrians, Neo-Babylonians, Israelites, and others have written about them as well. There were some instances, however, where it was, admittedly, quite challenging to capture both insider and outsider perspectives. Perhaps the most obvious example is my chapter on the history of archaic Sparta (Chapter 5).

Apart from the 7th century BC poet, Tyrtaeus, whose surviving works provide only a vague outline of the political organization of Sparta at this time,[37] there are virtually no ancient authors from Sparta itself who can provide us with an insider perspective on their government. Those who wrote extensively on the political history of Sparta were, by and large, outsiders who tended to view the city as peculiar in comparison to the other polities of Greece.[38] Furthermore, a number of our surviving ancient literary sources are not only separated geographically from archaic Sparta and its political institutions, but temporally as well. For example, authors such as Plutarch and Justin wrote their works at a time when Sparta no longer existed as an independent polity but was firmly under the hegemony of the Roman Empire as it had been for centuries by that point.[39] For these 2nd century Roman authors, the city of Sparta was little more than a popular tourist destination and a relic of a bygone era. The fact that our sources on the history of Sparta were written mostly by outsiders is quite problematic as these non-Spartan authors seem to have fallen into the habit of distorting the city's exceptional features or idiosyncrasies.[40] Moreover, it seems that the Spartans themselves were inclined to misinform outsiders on their way of life so that they could give off the impression that they were more powerful, intimidating, or brutal than they really were and deter others from challenging their authority.[41] These sorts of myths or exaggerations likely became even more prominent over time as authors became more and more separated temporally from the events and institutions of early Spartan history. As a

whole, scholars have called this tendency in our ancient sources to exaggerate or idealize Sparta's features the 'Spartan Mirage.'[42]

While the 'Spartan Mirage' admittedly creates several challenges in reconstructing the history of archaic Sparta, I believe that I have made notable efforts in my research to mitigate these issues. First of all, to avoid the issue of relaying falsehoods or distortions that have emerged in the literary tradition over time, I have decided to primarily rely on sources that are older or written closer temporally to the events I discuss. For this reason, throughout my thesis, I will rely far more on authors like Herodotus (485-425 BC), than Plutarch or Justin (2nd century AD). Even though some of the events of the Archaic Period are, unfortunately, only recorded in much later sources, I will often provide this information with the caveat that it warrants suspicion or by pairing it with modern scholarship on the topic. Furthermore, to get as close as possible to an insider's perspective on Sparta, I have given preference to sources written by authors who are known to have lived in the city, even if they were not themselves, Spartan citizens. For example, in my chapter on the history of archaic Sparta, I will frequently rely on Xenophon as he is known to have fought under the Spartans as a mercenary, been a close friend of the Spartan king Agesilaus II, and had his own sons raised and educated in the city.[43] Similarly, I will also frequently rely on Thucydides as he is known to have lived amongst the Spartans and gathered information from them during his twenty-year exile from Athens following the Battle of

[42] This term was first coined in: François Ollier, *Le Mirage Spartiate: Étude Sur l'idéalisation de Sparte Dans l'antiquité Grecque Du Début de l'école Cynique Jusqu'à La Fin de La Cité* (Paris, France: Les Belles Lettres, 1943).

[43] Xenophon *Anabasis* 7.6, *Agesilaus* 1.1, *Hellenica* 3.1.6, 3.2.7, Plutarch *Life of Agesilaus* 20.2. Although it should be noted that in recent years some scholars have questioned whether Xenophon's sons were truly raised in Sparta, such as: Noreen Humble, "Xenophon's Sons in Sparta? Perspectives on *Xenoi* in the Spartan Upbringing," in *Spartan Society*, ed. Thomas J. Figueira (Swansea, Wales: The Classical Press of Wales, 2004), 231–50.

Amphipolis in 424 BC.[44] Thus, by primarily relying on our oldest extant sources and by providing both outsider and insider (or at the very least quasi-insider) perspectives whenever possible, I believe that my research method has allowed me to mitigate some of the challenges presented in our ancient source material, such as the phenomenon of the 'Spartan Mirage.'

Another challenge that our ancient sources present, is the tendency to over-simplify the political developments of archaic Greece by providing what we would today call a 'Great Man' history.[45] Instead of capturing the complexities or nuances of a city's political developments, our ancient sources often attribute a city's system of government to a single founder or lawgiver. For example, our ancient sources on the history of Athens often treat Cleisthenes as the sole founder of the city's democracy.[46] This view is, of course, quite problematic as it assumes that Cleisthenes made his constitutional reforms by relying purely on his own genius and not by relying on any outside influences or pre-existing concepts. Moreover, it assumes that Athens' 'democracy' was a stable institution that did not undergo any major changes or developments following its creation in 508 BC.

In my thesis, I have tried to distance myself from this 'Great Man' approach to history-writing. While I will certainly make mention of lawgivers like Cleisthenes and their contributions to their cities' political systems, I will also treat our information about these figures with skepticism and remind the reader to be cautious of our ancient sources' overgeneralizations

(for examples, see pages 66, 87, 89 & 99-100). Furthermore, I will demonstrate that the political developments of archaic Greece were, in many instances, not the product of a single man's actions, but a response to broader social conflicts and political tensions in Greek cities (see pages 54-56, 65 & 88). By doing so, I will show that there were, in all likelihood, a number of other groups or individuals who played key roles in the political developments of the Archaic Period, but whose names are, unfortunately, not recorded in the annals of history.

Instead of suggesting that the constitutional reforms of archaic Greece were accomplished entirely through the agency and innovations of famous lawgivers, I will propose that these reforms received external influence and were modelled off preexisting systems of government. In particular, I will advocate that the political developments of archaic Greece were inspired by the Phoenicians, a people who were also developing broad-based oligarchical systems of government at this time.[47] I will make this argument mostly by comparing Phoenician systems of government with those of archaic Greece and by showing that they shared a number of remarkable similarities. I will also demonstrate that the trend of establishing broader non-monarchical forms of government appears to have begun several centuries earlier among the Phoenicians than the Greeks, which means that it is quite possible that the political systems of archaic Greece were, in some ways, inspired by these various Phoenician precursors or counterparts.

Because I argue that the Greeks gradually turned to outside influences (i.e. the Phoenicians and their political institutions) for solutions to their growing social problems in the Archaic Period, one could say that my thesis adheres to the Diffusion of Innovations Theory.

---

[47] Stephen Stockwell, "Before Athens: Early Popular Government in Phoenician and Greek City States," *Geopolitics, History, and International Relations* 2, no. 2 (2010), 129.

This theory states that over time, new ideas and technologies tend to spread through channels of communication to neighbouring civilizations, where these innovations can also be put to good use.[48] One could say that my thesis also adheres to Network Theory, an approach that has, in recent years, been increasingly used by scholars to argue that instead of viewing the ancient Mediterranean as a series of distinct or separate regions, we should conceptualize it as a collection of nodes linked to one another by networks of exchange.[49] Considering the ancient Mediterranean was such a hub of trade and interaction – not least between the Greeks and Phoenicians – I will contend that the political developments of archaic Greece were, in many ways, the consequence of diffusion or cross-cultural communications. By doing so, I will stand in direct opposition to Hellenocentrism, the notion that ancient Greek civilization essentially emerged from within itself and was unique or exceptional in antiquity. I will also stand in direct opposition to Oriental Despotism, the assumption that throughout history, almost all 'eastern' states relied on narrow authoritarian regimes,[50] as I will demonstrate that broad-based systems of rule clearly existed, not just in ancient Greece and the western Mediterranean, but in the ancient Near East as well.

Having briefly summarized both what I accept and reject as research approaches, I hope to have provided a clear impression of where my research falls in line in terms of its

methodology. Although there are, admittedly, several challenges in reconstructing the history of Archaic Period, I believe that I have made notable efforts to mitigate these issues by employing a wide range of sources, modern scholarship, and a healthy bit of skepticism, especially regarding the early history of Sparta and the numerous achievements ascribed to ‘Great Men.’ With this research method in mind, I shall now proceed to lay out my arguments and begin my discussion on the political histories of ancient Greece and Phoenicia.

Chapter 3
From *Wanax* to *Basileus*: A History of Greek Monarchies from the Bronze Age to the Archaic Period

> "I think it is best that we no longer be ruled by one of ourselves as a monarch, since that kind of government is neither pleasant nor good… How could monarchy be a harmonious and coherent system when it permits the ruler to do whatever he wishes, to be accountable to no one? Even the best of men, if placed in this position of power [i.e. king], would lose his normal mental balance, for arrogance will grow within him as he enjoys all the good things at hand, as will envy, too, which is always a fundamental component of human nature… The rule of the majority, however, not only has the most beautiful and powerful name of all, equality [ἰσονομίην], but in practice, the majority does not act like a monarch. Indeed, the majority chooses its magistrates by lot, it holds all of these officials accountable to an audit, and it refers all resolutions to the authority of the public. I therefore propose that we abandon monarchy and raise the majority to a ruling position, for in numbers lies everything."[51]
>
> – Herodotus, *Histories* 3.80.2-6.

Before discussing how, as the Archaic Period progressed, the various city-states of Greece increasingly turned away from their traditional, monarchical forms of government towards systems of collective rule where power was more broadly distributed, it is important to first demonstrate why scholars believe monarchies were so prevalent in Greece to begin with. In this chapter, I will briefly summarize both the archaeological and literary evidence for the presence of kingships in Greece from the Mycenaean Bronze Age to the Archaic Period. As I am doing so, I will particularly try to address the question of whether kings ruled over Greece in the early Iron Age, as this is an especially difficult topic to address given that literacy had almost entirely disappeared from the region at this time, leaving us no written records from the period to rely on. Despite these challenges, I will demonstrate that it is, nevertheless, fair to assume that monarchies existed, by and large, throughout Greece up until the Archaic Period, when dramatic changes begin to occur in the Greeks' political thought or systems of government. This fact is significant for my thesis, as it shows that the Greeks started broadening their governments and

[51] Translation taken from: Robert B. Strassler, ed., *The Landmark Herodotus: The Histories*, trans. Andrea L. Purvis (New York, NY: Anchor Books, 2009), 245-246.

lessening their kings' powers several centuries *after* the Phoenicians had already begun to do so (as I will demonstrate in further detail later on in Chapter 7).

Let us begin by discussing the Bronze Age (3000-1200 BC), the period when an urbanized literate civilization (i.e. the Mycenaeans) first began to emerge in mainland Greece. From the works of Homer[52] and the numerous Linear B tablets discovered at sites such as Pylos or Knossos,[53] we know that during the Bronze Age, Mycenean Greece was divided into a number of kingdoms that were each ruled by a monarch called a *wanax*. These *wanakes* or 'great kings' held control over large swaths of territory and appear to have played a central role in their states' economies as they managed the cultivation of crops, taxed the population, and kept detailed records of commercial activity.[54] We also know that *wanakes* had a number of lesser officials serving beneath them to help manage and administer the various communities in their kingdoms, such as *damokoroi* or 'provincial governors' who appear to have been directly appointed by the *wanax* himself.[55] The significant role and authority of Mycenaean kings can perhaps also be inferred from Hittite records such as the Tawagala letter where the Hittite king, Hattusili III (1267-1237 BC) refers to a contemporary Mycenaean (Ahhiyawan) leader as a 'great king,' his 'brother' and his 'equal.'[56] This suggests that the status of Mycenaean kings was comparable or similar to that of contemporary Near Eastern monarchs.

The various kingdoms of the Mycenaeans appear to have dominated the political landscape of Greece for several centuries up until the Bronze Age Collapse (c. 1200 BC), when

they were ultimately toppled and fractioned into a variety of smaller independent communities. These more sparsely populated settlements seem to have, to some extent, continued to operate under monarchical forms of government in the early Iron Age. These early Iron Age kings, however, held sway over much smaller territories and were not called *wanakes* but *basileis*, a title that likely derives from the Mycenaean *qa-si-re-u*, a hereditary 'chieftain' who ruled over a village on the *wanax's* behalf.[57]

The existence of these monarchies in early Iron Age Greece is, in some ways, exhibited through the archaeological record. At a number of early Iron Age sites, archaeologists have discovered large buildings which seem to have been of central importance to the community and to have served as the dwelling of the local ruler. In fact, many of these discovered dwellings are *megara,* the same style of structure that, during the Bronze Age, served as the palaces and throne rooms of Mycenaean kings (*wanakes*).[58] At Tiryns, for example, after the city was destroyed during the Bronze Age Collapse, a *megaron* (known as Building T1) appears to have been constructed directly atop of its Mycenaean predecessor on the city's acropolis and to have continued to be used there until the mid 8th century BC.[59] The fact that this Iron Age *megaron* was discovered with twelve large *pithoi* (ceramic vessels used for storing grain and fluids) along its rear wall seems to be an indication that this structure primarily served as a residence and not a temple or religious site during this period.[60] Moreover, the fact that this building reused many of

the architectural features from the site's previous *megaron,* including the platform where the *wanax'* throne presumably once stood, suggests that this Iron Age structure served a rather similar function as its Mycenaean precursor: to house the local ruler. Considering that this building continued to be used for several generations, from the 11th to the 8th century BC without interruption, it seems that the rulers who dwelt there were, in all likelihood, hereditary or dynastic leaders (i.e. kings).[61]

Another example of a site that contains evidence of monarchical rule during the early Iron Age is the community of Nichoria in the Peloponnese. There, archaeologists have unearthed a *megaron* structure (known as Unit IV-1) built in the mid 11th century BC, which occupied the central ridge of the community. Over time, this *megaron* was remodeled by having a larger courtyard added to its front while an apsidal storage room was built onto its rear. Even though there are signs of cult activity at Unit IV-1, the presence of *pithoi* (storage containers), *scyphoi* (drinking cups), and other ceramic cooking vessels seems to clearly indicate that this structure functioned as a dwelling and not a temple.[62] Given the size of this *megaron*, its central position within the community, and the fact that it was inhabited for several generations, scholars assume that this building must have belonged to the local *basileus* of Nichoria and his dynastic successors.[63]

In addition to the sites of Tiryns and Nichoria, several other Greek communities dating to the early Iron Age have been discovered containing large central dwellings that are believed to

have belonged to the local king (*basileus*).[64] Such sites include examples from beyond the Greek mainland as well like the community of Emporio on the island of Chios, which appears to have had a large, 18 by 6.85m *megaron* built within its fortified acropolis in the 8th century BC that was kept noticeably apart from the other residential buildings in the community until the site's abandonment in the mid-Archaic Period.[65] While these structures may provide key insight into the political institutions of early Iron Age Greece, one must also recognize that the question of whether these structures belonged to a local king (*basileus*) is often determined through the subjective interpretation of facts like the building's size, its architectural features, prominent position in the community, interior furnishings, and the other finds associated with it.[66] Therefore, although the abovementioned evidence is certainly noteworthy and compelling, its shortcomings should also be acknowledged and warrant a degree of caution.

Another way archaeologists have advocated for the existence of monarchical political systems in early Iron Age Greece is by examining burials. For example, at the site of Lefkandi on the Greek island of Euboea, archaeologists have discovered a massive 50-meter-long structure dating to the mid 10th century BC, which contains the remains of two individuals, one male and one female, along with several ornate grave goods, some of which came from as far away as Babylon.[67] Considering the size of this mausoleum and the quality of the goods found within it, especially compared to contemporary graves discovered at the site, scholars believe that these

remains must have belonged to the community's king (*basileus*) and queen (*basileia*).[68] Even scholars like Mait Kõiv, an individual who is generally rather sceptical of the archaeological evidence of monarchy at this time, admits that the so-called heroön of Lefkandi is one clear example of early Iron Age kingship in Greece.[69] Another example from the island of Euboea is the site of Eretria, which contains a number of high-status burials near its West Gate dating to the 8th century BC.[70] These burials were each accompanied by a variety of valuable grave goods such as daggers, diadems, bronze cauldrons, jewels, and more. Of particular note is a man buried in Tomb 6, who was accompanied by a Mycenaean-era *skeptron*, a bronze staff or spear that appears to have been passed down to him as an heirloom, perhaps as a symbol of his family's royal prerogative.[71] Combined with the fact that these burials seem to have later become the focus of a local hero cult and that there is a near contemporary structure (Building A) in the city which could have quite possibly served as the ruler's dwelling, scholars believe that those buried at this cemetery must have been the king (*basileus*) of Eretria and his royal family.[72]

On the island of Cyprus near Kourion, archaeologists have discovered a number of Greek tombs that also appear to have belonged to the local royal family. These tombs date back to the 11th century BC and were discovered containing a variety of lavish grave goods such as bronze tripods, ceramic kraters, gold rings, and more.[73] One of the earliest burials at the site, Tomb 40 was even found containing an ornate gold sceptre, which has been interpreted by scholars as

proof that the individual buried there was a king (*basileus*),[74] given that sceptres were considered the typical symbol of royalty in antiquity.[75] Epigraphical evidence from the later tombs at this site seem to only confirm that those buried there were members of the royal family. For example, one 8th century BC bowl discovered at the site, known as Cy8, contains an inscription claiming that it was the property of a certain Akastor, the king or 'βασιλῆFος' of Paphos (a nearby Greek city on the island).[76] A similar bowl, referred to as Cy14, has an inscription claiming "I belong to king [βασιλῆFος] Diweithemis."[77] A third bowl discovered at the site, known as Cy6, does not list the name of the king who was buried there, but at the very least provides a depiction of an enthroned man and woman who are labelled 'the king' and 'queen' respectively.[78] It is also worth mentioning that two 7th century gold bracelets were discovered in one of these tombs containing the inscription "of Eteandros, king [βασιλῆFος] of Paphos,"[79] an individual who was most likely the very same "Ituandar, king of Pappa" mentioned in contemporary Neo-Assyrian records.[80] In sum, there are a variety of archaeological remains which seem to demonstrate that in the early Iron Age, Greek communities operated under narrow monarchical forms of government ruled by a local chieftain or *basileus*. In the case of the royal tombs of Kourion, we even seem to have epigraphical evidence to corroborate the fact that those buried there, were indeed kings (*basileis*).

Unfortunately, our archaeological information is the only evidence we have for Greek monarchies that comes directly from the early Iron Age itself, since this was a time when literacy had almost entirely disappeared from the region, leaving no written evidence behind. Nevertheless, once literacy remerged in Greece in the early Archaic Period with the adoption of the Phoenician script, our earliest written sources do seem to paint a rather similar picture: that the various communities of Greece were primarily ruled by monarchs in the aftermath of the Bronze Age Collapse. For example, the Homeric epics portray Greece as being subdivided into various kingdoms, each ruled by a hereditary chieftain or '*basileus*.' Leaders such as Proetus of Corinth or Pheidon of Thesprotia are repeatedly referred to as the *basileus* of their respective polities and appear to have ruled as such because they descended from a long line of similar kings.[81] The central importance and authority of these monarchical rulers is revealed already in the first book of the *Iliad*. When Achilles begins his dispute against King Agamemnon, Nestor admonishes him by saying "As for you, son of Peleus, do not seek to rival a king [βασιλῆϊ] by force, since a sceptre-holding king [σκηπτοῦχος βασιλεύς] to whom Zeus grants glory enjoys a greater portion of honour [τιμῆς] than other men do."[82] The fact that Greece was divided into these various kingdoms each ruled by a local *basileus* and his dynastic successors seems to be treated as an assumed fact throughout the Homeric epics and to have played a central role in their plots. For example, the plot of the *Odyssey* largely centers around the tensions between Odysseus' young son Telemachus and the various suitors who are threatening to steal his birthright [γενεῇ πατρώιον] and become king [βασιλῆα] of Ithaca by marrying his mother, Queen Penelope.[83]

[83] Homer *Odyssey* 1.385.

In addition to the king or *basileus* of a community, assemblies (ἀγοραί) and councils (βουλαί) seem to have also played a significant role in politics too, as they are repeatedly portrayed in the Homeric epics deliberating on important matters of state and advising their king.[84] However, even though kings are often portrayed ruling in conjunction with other assemblies or governing bodies, it seems that the king ultimately had the final say in political matters.[85] For example, when in Book 2 of the *Iliad*, an assembly (boule) of the Greeks is debating whether they should abandon their expedition against Troy, Odysseus rebukes them by saying, "there is no way that we Achaeans can all serve as kings [βασιλεύσομεν] here. Many rulers are an evil thing, so let there be a single commander, one king [βασιλεύς], to whom the son of crooked-scheming Cronus has given a sceptre [σκῆπτρόν] and the power to judge, to decide over his people."[86]

The overwhelming presence of monarchies or kingships in the Homeric epics is noteworthy as scholars believe that these works not only reflect oral traditions that trace back to the late Bronze Age but also, to a large degree, the events and institutions of Homer's own day or lifetime.[87] From this, perhaps we may conclude that kingships resembling those presented in the Homeric epics, existed throughout the early Iron Age and at the time when these works were produced. As Pierre Carlier explains:

> It is hard to believe that the Greek epic poets would have imagined this political system if it was totally unknown to the Greek communities themselves… kings probably existed in most Greek communities of the early archaic period – villages, *ethne* and many emerging *poleis*; they probably worked more or less as the poems describe them. As this type of

> government is considered traditional by the poets and their audience, it probably already existed in the late Dark Age.[88]

Carlier's argument here seems to be only further supported by the fact that several early Iron Age structures that are believed to have functioned as the dwelling of a local king, closely match the descriptions found in the Homeric epics. For example, at the early Iron Age site of Zagora on the Greek island of Andros, archaeologists have discovered a large *megaron* known as House 19, which is believed to have belonged to the local *basileus* and has been noted for its remarkable similarities to Odysseus' palace – especially its walled courtyard and feasting hall – as it is described in Homer's *Odyssey*.[89]

Besides Homer, a variety of other authors from the Archaic Period provide us with the impression that monarchies existed throughout early Iron Age Greece. For example, the archaic poets Tyrtaeus (mid 7th century BC) and Pindar (late 6th century BC) tell us that after the Bronze Age Collapse, the Peloponnese was invaded by Dorian Greeks supposedly descended from Heracles who proceeded to divide the region amongst themselves and rule over it as kings (*basileis*).[90] Some parts of the Peloponnese even seem to have continued to be ruled by these Heraclid kings during the Archaic Period, such as Argos. The 7th century ruler, Pheidon of Argos, for example, who played a crucial role in expanding the city's influence over the Argolid plain and in creating a standardized system of weights and measurements, is said to have been a member of Argos' Temenid dynasty and ruled over the city as its rightful monarch (called either *basileus* or *tyrannos*).[91] Although our most detailed accounts of Pheidon and the other Temenid

kings of Argos mostly come from the Classical Period and beyond, it seems fair to say that by the late Archaic Period, such stories were already in extensive circulation. When the Macedonian king, Alexander I tried registering for the Olympics in 504 BC, he did so by claiming that his family was descended from Argos' Temenid dynasty.[92] After the careful consideration of the Olympic judges (Ἑλληνοδίκαι), Alexander I's claims were determined to be true and he was permitted to take part in the games, which clearly suggests that by this time, the stories of Argos' Temenid kings were well-known and widely accepted as historically accurate. Otherwise, it would have hardly made sense for Alexander I to seek legitimacy in this way. In fact, some modern scholars have even argued that it was only in the closing decades of the Archaic Period, after the Battle of Sepeia in 494 BC, that Argos fully abolished its Heraclid monarchy in favour of a broader, more democratic political system.[93]

It is likely that Messenia was another region in the Peloponnese that continued to be ruled by its Heraclid kings during the early Archaic Period. Numerous sources from the early Classical Period and beyond record the names and deeds of Messenia's various Heraclid kings and even claim that these monarchs were still ruling during historical events like the First Messenian War (743-724 BC).[94] Moreover, surviving fragments of the *Processional Hymn to Apollo,* written by the late 8th century BC poet Eumelus of Corinth, indicate that this work was commissioned in

honour of the contemporary Messenian king, Phintas of Ithome and his recent dedications at the sanctuary of Delos.[95] Although the archaic poet Tyrtaeus unfortunately does not mention any kings of Messenia in the few surviving fragments of his poetry, he does claim that during the Second Messenian War (c. 660-650 BC), the Messenians allied themselves with both the Arcadians, led by their king (βασιλέα) Aristocrates of Orchomenus and the Pisans, led by their king, Pantaeleon.[96] Thus, Tyrtaeus seems to confirm that during the early Archaic Period (i.e. his own lifetime), communities in the Peloponnese were often ruled by a local king or *basileus* who traced his lineage back several centuries, to the Dorian invasion of Greece that had supposedly occurred just after the Bronze Age Collapse (for more on this topic, see my later discussions on the early histories of Corinth and Sparta in chapters 4 and 5 respectively).

In addition to the Peloponnese, several Greek communities in Asia Minor claimed to have been ruled by kings throughout the early Iron Age as well. For example, the island of Lesbos was said to have initially been ruled by a series of kings (*basileis*) known as the Penthilids, who were supposedly descended from King Penthilus, the leader who had encouraged the Aeolian Greeks to first settle there.[97] Aristotle tells us that the Penthilid royal dynasty (βασιλικὰς δυναστείας) was eventually overthrown after it had fallen out of favour with the people of Lesbos for ruling too despotically.[98] Aristotle mentions a revolt against the Penthilids led by a certain Megacles, whose supporters had grown tired of the Penthilids' practice of beating the populace with staves (κορύναις). Aristotle also mentions a later instance, where a

[98] Aristotle *Politics* 5.1311b.

man named Smerdis assassinated a Penthilid king as revenge for beating him and dragging him out of his wife's presence.[99] Although Aristotle does not mention when these events occurred, based on a fragment of the 7th century BC poet, Alcaeus, which appears to claim that the Penthilids were overthrown when he was still a young child,[100] scholars believe that these events likely occurred during the Archaic Period as opposed to the more remote, mythical past.[101] This can perhaps also be inferred from the surviving fragments of the near-contemporary poet, Sappho, who speaks rather harshly about the Penthilids, as though their reputation for being despotic rulers still existed in her lifetime.[102]

After the Penthilids were overthrown, Lesbos appears to have been ruled by a number of rather short-lived monarchies. The first of these monarchies was under the leadership of Melanchrus, an individual who is often called a tyrant (*tyrannos*) in our later ancient sources,[103] although the surviving fragments of the contemporary poet, Alcaeus, unfortunately reveal nothing about Melanchrus' official title, other than it was worthy (ἄξιος) of reverence or respect (αἴδως).[104] Melanchrus was then overthrown and replaced by the ruler Myrsilus, who is called a monarch (μοναρχίαν) in the poetry of the contemporary author, Alcaeus and either a king (*basileus*) or tyrant (*tyrannos*) in our later sources.[105] After the death of Myrsilus, we hear that Pittacus of Mytilene became the next monarchical leader of Lesbos. Pittacus is mostly referred to as the 'tyrant' of Mytilene,[106] although occasionally, he is called a *basileus* or *aesymnetes* as

well.[107] Upon his ascension to power, Pittacus seems to have formed an alliance with the Penthilids by marrying one of its members,[108] which caused the poet Alcaeus to accuse Pittacus of blatantly trying to seek legitimacy for his rule by associating himself with the island's former royal family.[109] In the end, Pittacus ruled over Mytilene for ten years before he abdicated from power, which seems to have ultimately brought an end to this dynastic system of government on Lesbos and led to the establishment of a broader oligarchical political system there.[110] Thus, it appears that it was only in the 6th century BC that a much broader, more collective system of government was truly established on the island. All of our literary information about Lesbos before this period, including the works of the archaic poet Alcaeus, suggest that the island was ruled by a series of kings (i.e. the Penthilids) or other monarchical governments (i.e. tyrannies) ever since the early Iron Age, when the island was first settled by the Aeolian Greeks.

Another region in Asia Minor that was said to have been ruled by a series of kings in the early Iron Age, is Ionia. Our earliest reference to this come from the surviving fragments of the late 7th century BC poet, Mimnermus, a native Ionian from the city of Smyrna. Mimnermus claimed that after the Peloponnese was invaded by the Dorian Greeks, the descendants of the legendary king Nestor of Pylos (i.e. the Neleids) proceeded to migrate to Ionia and rule there as kings.[111] Mimnermus says that the founder of Colophon, for example, was Andraemon of Pylos.[112] From the works of later authors such as Pherecydes of Athens, Herodotus of Halicarnassus, and Hellanicus of Lesbos (individuals who were all born in the late Archaic

Period, but wrote their works in the early Classical Period) we hear that the city of Ephesus was founded by the Neleid, Androclus, while Miletus was founded by Neleus son of Codrus.[113] Unfortunately, the names of the remaining Neleid founders of Ionia are only preserved in our later sources from the Hellenistic and Roman Periods.[114] Nevertheless, it seems fair to assume that during the Archaic Period, such stories were likely already in circulation. The scholar, Robert Drews for example, has no problem claiming that "most Ionians of the Archaic period believed that their ancestors had emigrated from Neleus' Pylos, and presumably they regarded their twelve cities [or *Dodecapolis*] as founded by offspring of Neleus' twelve sons."[115]

Not only do our ancient sources mention the various legendary founders of Ionia's twelve cities, but in some instances, they suggest that these Neleid kings were still ruling in the early Archaic Period. For example, the 5th century BC author, Ion of Chios claimed that his native island of Chios was still ruled by a Neleid king (*basileus*) named Hector, when it joined the Ionian League and began taking part in sacrifices at the Panionion.[116] Considering that the Ionian League and Panionion sanctuary of Poseidon Heliconius at Melia were not established until the 7th century BC,[117] it seems that Ion is situating King Hector of Chios, not in the distant mythical past, but in the relatively recent history of the Archaic Period. Another example would be when the 5th century BC historian, Herodotus claims that the reason why the Aeginetans decided to

help the Spartans invade the Ionian island of Samos in 525 BC was because they wanted revenge for a previous offence that the Samians had committed against them under the reign of their king (*basileus*), Amphicrates.[118] Although Herodotus does not provide us with a specific date for when this king of Samos ruled, he does seem to be implying that his reign and commencement of this enmity with Aegina occurred in relatively recent memory. Some scholars have argued that King Amphicrates of Samos likely ruled around the time of the Lelantine War in the late 8th century BC,[119] while others have argued that he ruled in the late 7th century BC.[120] Regardless of which theory is true, it seems that scholars tend to believe King Amphicrates of Samos was a real historical figure who reigned, not in the remote mythical past, but during the early Archaic Period. There are several other references in our later Hellenistic and Roman sources that additionally seem to place the reigns of various Ionian kings in the Archaic Period, although the historical reliability of these sources should be treated with a greater degree of caution considering that they were produced much later than the events they recorded.[121]

Nevertheless, it seems fair to say, based on our ancient literary evidence, that the Ionian Greeks were likely ruled by kings (*basileis*) throughout the early Iron Age up until the Archaic Period. Several ancient sources including the 7th century BC poet Mimnermus, provide us with the impression that the Ionian Greeks of the Archaic Period widely believed that their cities had been founded by legendary kings and ruled by their descendants for several generations. Some sources even seem to suggest that certain Neleid kings, such as Hector of Chios, were still ruling

[121] The other Greek kings of Asia Minor who appear to have ruled in the Archaic Period are: King Hippoclus of Chios (mentioned in Plutarch *On the Bravery of Women* 3), King Demoteles of Samos (mentioned in Plutarch *Greek Questions* 57), Kings Amphitres and Leodamas of Miletus (mentioned in Conon *BNJ* 26 F1 section 44 and in Nicolaus of Damascus *BNJ* 90 F52-53), King Agamemnon of Cyme (mentioned in Julius Pollux *Onomasticon* 9.83) and King Knopus of Erythrae (mentioned in Hippias of Erythrae *BNJ* 421 F1).

in recent memory and took part in the historical events of the early Archaic Period. At this point, I should also reiterate that we have archaeological evidence from the Ionian island of Chios, suggesting that a monarchical government existed there at the site of Emporio in the 8th century BC.[122] I should also, once again, draw attention to the fact that in the Homeric epics (works that were, in all likelihood, composed in the region of Ionia around the 8th century BC), there are no representations of non-monarchical forms of government.[123] There are only depictions of polities ruled by kings (*basileis*) and their subordinate advisory bodies or councils, which could very well suggest that these monarchical political systems were the standard form of rule at the time that the Homeric epics were produced.

Beyond Asia Minor and the Peloponnese, several regions in northern Greece claimed to have been ruled by kings in the aftermath of the Bronze Age Collapse as well. For example, the Molossian people of Epirus were ruled by a series of kings known as the Aeacids who claimed descent from Achilles' son Neoptolemus, a hero who supposedly arrived in the region and founded this dynasty shortly after the conclusion of the Trojan War.[124] The story of Neoptolemus' journey to Epirus and establishment of a royal dynasty there seems to have been well-known by at least the late Archaic Period as the poet Pindar alludes to it several times in his poetry, such as in his seventh Nemean Ode where he claims that Neoptolemus "when he sailed away [from Troy] missed Scyros, but after wandering, he and his men reached Ephyra. In Molossia he ruled as king [ἐμβασίλευεν] for a short time, but his offspring [γένος] have forever

since [αἰεὶ] held that privilege of his."[125] The myths connecting Achilles' son, Neoptolemus to the region of Epirus may have already been in circulation at the time the Homeric epics were produced. It is notable that when, in the *Iliad*, Achilles prays to Zeus, he does so by invoking Zeus' cult form from Dodona, the oldest and most famous oracle in all of Epirus.[126] This invocation is noteworthy, as it is not only the sole reference to Epirus in the entire epic,[127] but the far more common practice in the *Iliad* seems to have been to invoke Zeus' cult form from the nearby mount, Ida.[128] Thus, Achilles' unusual invocation of Zeus' cult form from Epirus here may have been a subtle reference to the fact that this region was known for later becoming the land ruled by his son Neoptolemus and his subsequent progeny.[129]

The names and deeds of the various Aeacid kings of Molossia from the Classical Period until the late 3rd century BC, when this dynasty was eventually removed from power, are well-attested in our ancient sources.[130] However, our knowledge of Epirus' Aeacid kings in the Archaic Period unfortunately remains rather obscure with the exception of perhaps two individuals. The first is the Molossian king, Admetus, who is first attested in Thucydides' history and appears to have ruled around the time of Xerxes' invasion of Greece in 480/479 BC.[131] Thus, to consider this figure an archaic king would, in a way, be splitting hairs. The second individual who may very well have been a member of Epirus' Aeacid dynasty is Alcon of Molossia, an

individual who is first referenced in Herodotus' history and is said to have tried to form an alliance with the tyrant, Cleisthenes of Sicyon by marrying his daughter Agariste around the year 565 BC.[132] However, Herodotus never actually specifies whether Alcon of Molossia was a member of the Aeacid royal family so the question remains unclear.

Despite this obscurity, it nevertheless seems fair to assume that the Molossians were ruled by their Aeacid kings throughout the Archaic Period. It is unlikely that the stories of Neoptolemus' journey to Epirus and founding of a royal dynasty there would have been in circulation during the late Archaic Period and referenced several times in Pindar's poetry, if the Aeacidae were not an already well-established dynasty ruling over the Molossians by this point in time. It is also notable that Aristotle, in his *Politics* uses the Molossian royal family (ἡ περὶ Μολοττοὺς βασιλεία) as a prime example of a dynasty that has continued to rule in Greece for an exceptionally long time (πολὺν χρόνον διέμεινεν).[133] Aristotle then goes on to compare the Molossian royal family with the kings of Sparta, another long-lasting monarchy that was in power throughout the Archaic Period (for more information about Sparta's kings, see pages 62-64). Several other ancient authors also emphasize the great antiquity of the Molossian royal family and the fact that this dynasty seems to have continued to rule without interruption, from the distant mythical past to the historical period.[134] Therefore, if we know that kings (*wanakes*) were ruling before the Bronze Age Collapse and we know that kings (*basileis*) were ruling Epirus afterwards as well (during the events of the Classical Period and beyond), then it seems reasonable to assume that kings were likely ruling Epirus in between these two periods too, even

if all we have are later, semi-legendary accounts about this region's early Iron Age history. As J.K. Davis puts it:

> Even if we decline to accept as historical the details of the developed story of its origins, the Aeacid dynasty was clearly well rooted in Molossian society in the archaic period, and provided military leadership while also serving as the unifying focus and as 'the government.' Its similarity to the Macedonian monarchy on the other side of Pindus… would be obvious enough even without Aristotle's own juxtaposition of them in *Politics* 1310B34ff. We may even think tentatively of Balkan Iron Age monarchy as a specific type of polity with its own uniformities and patterns of interaction.[135]

Another region in northern Greece that was said to have been ruled by kings (*basileis*) in the aftermath of the Bronze Age Collapse is Thessaly.[136] In the Classical Period, the people of Thessaly were divided into various territories, each ruled by a narrow oligarchy that was dominated by a local aristocratic family or *genos*. For example, the city of Larissa and the surrounding region were ruled by the Aleuadae, the city of Crannon and its surrounding area were ruled by the Scopadae, and the city of Pharsalus was controlled by the Creondae. These aristocratic clans were named after their founders, who were supposedly descendants of Heracles that had arrived in Thessaly soon after the Bronze Age Collapse and proceeded to rule over the region as kings (*basileis*). Such stories about the early Heraclid kings of Thessaly seem to have, at the very least, been in circulation by the late Archaic Period. Excavations at the Late Bronze Age *tholos* tomb at Georgiko have revealed that since the early 6th century BC, this site was the focus of a local hero cult in honour of Aeatus,[137] the Heraclid king who supposedly first conquered Thessaly and who fathered Thessalus, the eponymous founder of the Thessalian

people.[138] Moreover, the late archaic poet, Pindar demonstrates that he was clearly aware of the stories of Thessaly's early kings as he begins his tenth Pythian Ode, which was written in honour of the Aleuad, Hippocleas of Pelinna, by saying "Sparta is prosperous; Thessaly is divinely blessed. Both are ruled [βασιλεύει] by the race [γένος] of a single ancestor, Heracles."[139]

This quotation is noteworthy as it not only shows that Pindar was familiar with the stories of Thessaly's legendary kings, but by using the present tense βασιλεύει here, Pindar seems to be implying that Thessaly, like Sparta, was still being ruled by its Heraclid kings during his own lifetime. This can perhaps also be inferred from the final line of the poem, where Pindar claims that in Thessaly, the governing of states (πολίων κυβερνάσιες) is passed down from father to son (κεῖνται πατρώϊαι).[140] In addition to Pindar, a number of other ancient authors talk about Thessaly in the late Archaic Period as though it were still ruled by kings at this time. The first author that is worth mentioning here, is Simonides of Ceos, a 6th century BC poet who composed numerous odes for members of both the Aleuad and Scopad families.[141] Unfortunately, the few surviving fragments of Simonides' poetry do not reveal the official title or function of these Thessalian aristocrats. However, we do have a poem from the Hellenistic author, Theocritus, which refers to Simonides' two patrons Antiochus son of Echecratides and Aleuas son of Simus, as the ἄνακτος or *wanax* of their respective cities and claims that these kings' deeds would have all been forgotten, if not for Simonides' immortal poetry.[142] Moreover, it seems likely that one of

Simonides' patrons here, Antiochus son of Echectratides, is the very same "Antiochus, king [βασιλεύοντι] of all Thessalians" mentioned in the works of the early 4th century BC Socratic philosopher, Aeschines of Sphettus.[143] We also know that another one of Simonides' patrons, Scopas son of Creon (or 'Scopas the Drinker'), featured in an early Hellenistic work known as *The Revenge-Killings of Tyrants*, which seems to suggest that the author of this work, Phaenias of Eresus considered Scopas to have been a *tyrannos* or tyrant.[144]

Another author who provides us with the impression that the Thessalians were still operating under a monarchical system of government in the late Archaic Period, is Herodotus. This is because, in his history Herodotus repeatedly refers to the leaders of Thessaly as *basileis* or 'kings.' For example, when Herodotus is describing the Athenian tyrant, Hippias' victory over the Spartans in 510 BC, he claims that this battle was won, in large part, thanks to the efforts of Hippias' Thessalian cavalry, who were led by their very own king (βασιλέα τὸν σφέτερον) Cineas of Conium.[145] Later on, when Herodotus is describing the Aleuadae's attempts to ally with the Persians in the leadup to Xerxes' invasion of Greece in 480/79 BC, he refers to the members of the Aleuadae simply as the 'kings of Thessaly' (Θεσσαλίης βασιλέες).[146]

Thucydides on the other hand, provides a much more obscure depiction of Thessaly's government. At times, Thucydides describes the Thessalians making their political decisions collectively (τοῦ πάντων κοινοῦ), as though they were ruled by broader councils or governing bodies.[147] Thucydides also claims that in battle, the Thessalians were led by a number of officials

whom he calls ἄρχοντες or 'archons,' the same term used for Athens' annually elected magistrates.[148] At other times, however, Thucydides seems to present a monarchical system of rule in Thessaly. For example, Thucydides claims that in 454 BC, the Athenians led an expedition to Pharsalus in order to restore Orestes, the exiled son of Echecratides, king of Thessaly (Ἐχεκρατίδου τοῦ Θεσσαλῶν βασιλέως).[149] Similarly, when Thucydides is describing the Spartan general, Brasidas' march through Thessaly in the summer of 424 BC, he claims that Thessaly's government was dynastic rather than democratic (δυναστείᾳ μᾶλλον ἢ ἰσονομίᾳ).[150] In addition to the abovementioned evidence, we have various sources from the Roman Period and beyond that also portray Thessaly as being ruled by monarchs (either *basileis* or *tyrannoi*) in the Archaic Period, although the historical value of these later sources should be treated with a much greater degree of caution or skepticism.[151]

Nevertheless, it seems fair to say that from at least as early as the 6th century BC, the Thessalians believed that their land had been invaded by descendants of Heracles in the early Iron Age who proceeded to rule over the region as kings and to found various royal dynasties there. In fact, based on the works of Pindar, Herodotus, and our surviving accounts about Simonides, we may even speculate that these Heraclid kings were still ruling over Thessaly in the late Archaic Period, as these authors often refer to Thessaly's leaders as *basileis*.[152] At times, Thucydides also speaks about Thessaly as though it were ruled by a monarchical form of government, although our information from Thucydides' history is much more contradictory and

confusing, leaving us with the impression that by the early Classical Period, only slight vestiges of Thessaly's former monarchical political system were still around.

Having sufficiently summarized our literary evidence for the presence of monarchies in Greece throughout the early Iron Age and, in some instances, the perseverance of these dynasties into the Archaic Period, it is now time to address some of the notable problems or shortcomings of this evidence. First and foremost, there is the fact that literacy did not exist in Greece from the 12th to 8th centuries BC, which means that for the early Iron Age history of Greece, we are primarily forced to rely on sources that were written several centuries later on, after the Greeks had adopted the Phoenician script in the early Archaic Period. Moreover, the surviving fragments of some of our earliest archaic sources are, on occasion, only preserved in the works of later authors, which is problematic as it requires us to trust that these later authors had quoted their sources reliably and did not adapt or distort their citations in order to serve their own agendas.

There is perhaps also a semantic issue that arises from our literary sources. While the term 'basileus' seems to have most often referred to a hereditary monarch in the Homeric epics and our other ancient sources,[153] it appears that these works did not always necessarily treat 'basileus' the same as the modern English word 'king.' For example, when the late 8th century BC poet, Hesiod mentions the *basileis* of his hometown, Thespiae, he does not appear to be referring to its 'kings,' but to a group of individuals who served as the city's judges and who presided over important legal matters.[154] Similarly, in Athens, from at least the early 7th century BC onwards, 'basileus' did not refer to the city's king, but to an annually elected official in charge of managing the state's religious affairs (this topic will be discussed in more detail on

[154] Hesiod *Work and Days* 38.

page 81). As a result, even though 'basileus' seems to have, by and large, been used to refer to a hereditary monarch in our ancient literary sources, it would be wrong to assume that *every* reference to a 'basileus' carries this exact meaning and must therefore, be considered evidence of a monarchical political system. In fact, some scholars have argued that the abovementioned references to the *basileis* of Thessaly in the late Archaic Period should be interpreted, not as references to Thessaly's 'kings,' but to their *tagoi,* elected officials who served as military leaders (although I do not know how convincing I personally find this argument to be, considering that these *tagoi* only appear as Thessaly's supreme magistrates in sources and events from the 4th century BC onwards).[155]

The last notable problem with our archaic sources that depict monarchies in early Iron Age Greece is that these accounts can, at times, be quite biased or prone to the influence of later events. Many scholars have noted that throughout the Archaic Period, the Greek ruling elite appear to have claimed descent from semi-divine kings and to have initiated the worship of these legendary ancestors, not necessarily out of a benevolent desire to record the past, but in order to justify the current social hierarchies or institutions in their cities.[156] Peter Rose, for example, argues that many of the legendary rulers of early Iron Age Greece were "claimed as legitimating ancestors of the self-styled *aristoi*… [as a way of] insisting on the genealogically based

---

[155] For more on this argument see: W. W. How and Joseph Wells, *A Commentary on Herodotus: with Introduction and Appendices*, vol. 2 (Oxford, England: Clarendon Press, 1957), 5.63.3, 7.6.2. Slawomir Sprawski, *Jason of Pherae: A Study on the History of Thessaly in the Years 431-370 BC*, 18-20.
Our earliest reference to the *tagos* as Thessaly's highest political position is in Xenophon *Hellenica* 6.1.8-9, 18, 6.4.33. Although we have inscriptional evidence for *tagoi* in the 6th and 5th centuries BC, this evidence seems to suggest that they were minor officials in charge of organizing small companies of troops and were not eponymous at this time. For more on this topic, see: Bruno Helly, "Tagos," in *The Oxford Classical Dictionary,* 3rd ed. (Oxford, England: Oxford University Press, 2005).

[156] Greg Anderson, "Before *Turannoi* Were Tyrants: Rethinking a Chapter of Early Greek History," *Classical Antiquity* 24, no. 2 (October 2005), 183-184.

superiority and therefore 'legitimacy' of the ruling elite."[157] Thus, one must acknowledge that our archaic sources for kings like the Penthilids of Lesbos or Aleuadae of Thessaly, may not necessarily present an accurate portrayal of the political institutions of early Iron Age Greece, but instead, the aetiological legends that these aristocratic families had invented for themselves by the Archaic Period in order to justify their position or status in contemporary society. Moreover, one must acknowledge the potential influence of broader, inter-state relations over our ancient sources for the Greeks' early Iron Age kings. For example, the abovementioned 5th century BC author, Pherecydes of Athens likely had a strong political motivation for recounting the stories of Ionia's legendary kings in his works. This is because, Pherecydes' native town of Athens also had myths about the Neleids ruling there in the early Iron Age (for more on this topic see page 77) and during Pherecydes' own lifetime, Athens ruled over much of the Ionian Greek world as *hegemon* of the Delian League. Thus, Pherecydes' retelling of the Neleids' founding of Ionia was quite possibly embellished to help legitimize Athens' relations with Ionia in the 5th century BC under the Delian League, an empire that was largely established by Cimon, a member of Athens' Philaid clan who also claimed descent from the legendary Neleid kings.[158]

Because of these various shortcomings in our literary sources, there are admittedly several challenges to using them as evidence for the presence of kings in early Iron Age or Archaic Greece. In fact, some scholars in recent years have decided to push back against the notion that Greece was primarily ruled by kings in the early Iron Age, arguing instead that at this time the Greeks began developing broader, non-monarchical systems of government.[159] I,

however, disagree with this argument and side more with the scholars who advocate that it was only later on, in the early Archaic Period that this shift towards broader, more collective political systems occurred.[160] While I agree that many of our literary sources are flawed and may not accurately portray the institutions or history of early Iron Age Greece, it seems like a bit of a stretch to suggest that *all* of these sources are completely unreliable and that in reality, early Iron Age Greece was dominated by a completely separate form of rule, oligarchy.

As this chapter has clearly shown, the Greeks of the Archaic Period widely believed that their cities had been ruled by hereditary monarchs after the Bronze Age Collapse until only relatively recently, when these monarchies were eventually overthrown. Furthermore, from at least the early Classical Period and beyond, the Greeks formally outlined the constitutional developments of their cities from the rule of hereditary kings (*basileis*) in their early history, to the rule of the tyrants who usurped them as monarchs in the mid 7th century BC, to the eventual establishment of broader, oligarchical political systems by the end of the Archaic Period.[161] To quote from Thucydides, "as Hellas grew more powerful and continued to acquire still more wealth than before, along with the increase of their revenue, tyrannies [τυραννίδες] began to be established in most of the cities, whereas before that [πρότερον], there had been hereditary kingships [πατρικαὶ βασιλεῖαι]."[162] Given the sheer amount of literary – not to mention archaeological – evidence we have, I see no reason to doubt this general outline of the Greeks'

constitutional developments; that there were hereditary monarchies up until the Archaic Period, when we start to see dramatic changes in the Greeks' political thought or systems of government. Furthermore, as the upcoming chapters will show, this gradual development of Greek political systems over the course of the Archaic Period, from hereditary monarchies to broader systems of rule, also existed in the traditions of perhaps our three most well-recorded *poleis*, Corinth, Sparta, and Athens. So, with this framework in mind, let us proceed to discuss the histories of Corinth, Sparta, and Athens and answer the questions of how, why, and when these states developed more collective systems of government. As I am doing so, it is worth taking note of the specific kinds of political institutions the Greeks introduced to broaden their governments as they appear remarkably similar to the councils, assemblies, and annual magistracies that also existed in ancient Phoenician city-states (as I will demonstrate in further detail in Chapter 7).

Chapter 4
A Political History of Corinth in the Archaic Period

> "Planted on an isthmus, Corinth had always been a commercial *emporium*; as formerly almost all communication between the Hellenes within and outside of the Peloponnese was carried out overland, and the Corinthian territory was the highway through which it traveled. She [Corinth] had consequently great money and resources, as is shown by the epithet 'wealthy'[163] bestowed by the old poets on the place, and this enabled her, when traffic by sea became more common, to procure her navy and put down piracy; and as she could offer a market for both branches of the trade [i.e. terrestrial and maritime commerce], she acquired for herself all the power that a large revenue affords."[164]
>
> – Thucydides, *History of the Peloponnesian War* 1.13.5.

Corinth, like the vast number of other Greek cities, began the Archaic Period under monarchical rule but over time experienced substantial political change, so much so that by the end of this period, it was ruled by a considerably broader, oligarchical form of government. As previously mentioned, following the Bronze Age Collapse, the Peloponnese was said to have been invaded by a group of Dorian Greeks supposedly descended from Heracles himself who proceeded to divide the region amongst themselves and rule over it as kings (*basileis*).[165] The city of Corinth was certainly no exception as its Bronze Age monarchs, the Sisyphidae, were believed to have been overthrown during the Dorian Invasion by the Heraclid, Aletes who then ruled over the city as its king (*basileus*) and established a new royal dynasty (*genos*) there.[166] These Heraclid kings were said to have ruled over Corinth for eleven generations, until their final

king, Telestes was eventually assassinated and overthrown by the members of his family sometime in the early Archaic Period, around the year 747 BC.[167]

After King Telestes' assassination, the members of his family – known as the Bacchiadae – were said to have formed an oligarchy in Corinth. Under this new form of government, elections were held each year to determine who would serve as the city's chief magistrate or *prytanis*, an annual position that essentially replaced the role of king.[168] In addition to the *prytanis*, there appears to have been other lesser officials who acted within this oligarchy as well, such as the Polemarch who was tasked with managing the city's military affairs.[169] Given that councils (βουλαί) and assemblies (ἀγοραί) are mentioned already in the Homeric epics, modern scholars have speculated that the Bacchiad oligarchy of Corinth likely had similar governing bodies in charge of advising the city's *prytanis* on important political matters, although we unfortunately hear no mention of these governing bodies in our surviving literary sources.[170]

While the Bacchiad oligarchy of Corinth was likely a broader form of government than the hereditary monarchy that preceded it, it is important to bear in mind that this was still a rather narrow political system where power rested in the hands of a very limited few.[171] Under this oligarchy, only members of the Bacchiad clan (*genos*) were permitted to run for political office or take part in the city's elections. This means that only a small handful of Corinthians would have been able to participate in the city's politics as Diodorus Siculus claims that at the time of Telestes' assassination in 747 BC, the Bacchiadae consisted of no more than two hundred of

[171] Stewart Irvin Oost, "Cypselus the Bacchiad," 10-11, argues that the Bacchiads even still used the title of king (*basileus*) while they ruled over Corinth.

Corinth's wealthiest aristocrats.[172] Furthermore, according to Herodotus, the Bacchiadae pursued a strict policy of endogamy, meaning they only allowed for intermarriage between fellow members of their clan so that the total number of Bacchiadae remained relatively small.[173] For these reasons, several ancient authors refer to the Bacchiad oligarchy of Corinth as though it, in truth, was not all that different from the monarchy that came before it. Herodotus, for example, refers to the Bacchiadae as ἀνδράσι μουνάρχοισι or 'monarchs.'[174] Similarly, Nicolaus of Damascus refers to the final ruler of the Bacchiad oligarchy, Patrokleides, not as Corinth's *prytanis* but as its king (*basileus*).[175] Diodorus Siculus likewise claimed that the eldest descendant (ὁ πρεσβύτατος τῶν ἐκγόνων) of the Heraclid, Aletes, ruled as king (ἐβασίλευσε) of Corinth until the tyranny of Cypselus (μέχρι τῆς Κυψέλου τυραννίδος), which suggests that he did not consider the leaders of Corinth's Bacchiad oligarchy to have been noticeably different from the hereditary monarchs (*basileis*) that ruled beforehand.[176] Finally, it is possible that Strabo also considered the Bacchiadae and their government to have been quasi-monarchical in nature, as he claimed that the Bacchiads ruled over Corinth as tyrants (οἱ Βακχιάδαι τυραννήσαντες).[177]

Be that as it may, in the end, the Bacchiad oligarchy lasted for less than a century before it was overthrown in 657 BC by Cypselus, a Corinthian aristocrat who instituted a new form of monarchical rule in the city by making himself its sole leader (c. 657-627 BC) and establishing his descendants as dynastic successors. Cypselus is most often referred to as a *tyrannos* or

'tyrant' in our ancient sources, although it should be noted that he is occasionally called a 'king' (*basileus*) as well,[178] which could suggest that he went by this title during his lifetime or that the differences between these two terms were not as distinct or clear-cut in the early Archaic Period.[179] According to Aristotle, Cypselus, like most other Greek tyrants, seized power over his city through demagoguery and the support of the masses.[180] This, to a certain extent, makes sense as we hear from our ancient sources that Cypselus enacted several populist reforms or policies throughout his reign. For example, after he ascended to power, Cypselus exiled the remaining Bacchiadae from the city, confiscated their property,[181] and likely redistributed these lands amongst Corinth's lower classes.[182] Meanwhile, he allowed the political enemies of the Bacchiadae that had been exiled from the city, to return to Corinth and regain their citizenship rights there.[183] Cypselus also devoted much of his efforts towards the construction of public buildings. Under Cypselus, both the sanctuary of Apollo on Temple Hill and the sanctuary of Poseidon at Isthmia were built.[184] Cypselus additionally made several contributions to panhellenic sanctuaries outside of Corinth, such as at Delphi where he built the oracle's first treasury or at Olympia where he dedicated an ornate chest.[185] For these reasons, Aristotle, Ephorus, and Nicolaus of Damascus all claim that Cypselus was so beloved by his fellow citizens that he never bothered hiring bodyguards for protection.[186]

With that said, in recent years, some scholars have decided to push back against this notion that championing the causes of the masses (*demos*) or acting as popular rulers were some of the unique and defining traits of ancient Greek tyrants.[187] For example, Greg Anderson argues that even though Cypselus and other Greek tyrants constructed a number of public works and had their fair share of lower class supporters, this was not necessarily unusual or radically different from the behavior of contemporary oligarchical leaders in the Archaic Period.[188] Moreover, Anderson demonstrates that it is highly unlikely that ancient Greek tyrants wanted to totally upend the current political system, social hierarchies, or status quo in their cities as these conditions were what ultimately allowed them to seize power and rule as tyrants to begin with. Thus, perhaps we should view tyrants, not as radical revolutionary figures, but as a consequence of what happens when one particular individual becomes too successful at eliminating their political rivals and at dominating their local oligarchical system of rule.[189]

So, if it was not the lower classes (*demos*) of Corinth who principally supported Cypselus and the overthrow of the Bacchiadae, then who did? Although it is never explicitly stated in our ancient sources, many scholars believe that tyrants like Cypselus were particularly supported by the local merchant class, which, at this time, was becoming increasingly wealthy as well as dissatisfied with their marginal role in the city's political decision-making.[190] As Robert Drews explains, "the growing complexity of the Greek economy… created a wealthy class distinct from the landed aristocracy. Distressed that the aristocrats monopolized all political power the

nouveaux riches backed a revolution which put into power a single ruler responsive to their wishes [i.e. a tyrant]."[191] There are perhaps a few indications that the tyranny of Cypselus was supported by the *nouveaux riches* that had become dissatisfied with their marginal role in Corinth's politics. Firstly, we know that Cypselus himself was a member of the Corinthian elite who remained on the periphery of political power under the Bacchiadae. Although his mother, Labda, was technically a member of the Bacchiad clan, according to Herodotus she was born χωλή or 'crippled.'[192] As a result, she was not sought by any suitors within her clan and was instead, forced to go against the aforesaid custom of endogamy and get married outside the family to Aetion son of Echekrates, a man of lower status.[193] Therefore, it is possible that Cypselus himself is an example of a wealthy Corinthian who sought to overthrow the Bacchiad oligarchy because it had largely excluded him from politics.

If the tyranny of Corinth was indeed supported by the local merchant class, then this would also explain why Cypselus and his successors pursued several policies of commercial expansion. For example, during his reign, Cypselus seems to have established close diplomatic ties with a number of contemporary mercantile powers such as Lydia, an Anatolian kingdom known especially for its production of gold. Under Cypselus' rule, King Gyges of Lydia made several lavish dedications to the aforementioned Corinthian treasury at Delphi.[194] During his reign, Cypselus also founded several colonies along the northwestern coast of Greece, such as at Ambracia, Leucas, and Anactorium, which were each placed under the rule of one of his

illegitimate sons.[195] This was most likely done in an effort to facilitate maritime trade between Corinth and the western Mediterranean, especially the various Greek colonies of southern Italy.

This policy seems to have continued to a certain extent under the reign of Cyspelus' successor, Periander (c. 627-585 BC), who founded the colony of Potidaea in Chalcidice and left it under the rule of his son, Evagoras, most likely in an effort to get more involved in the Thraco-Macedonian region's timber, gold, and silver trade.[196] This colony in particular would remain firmly under Corinthian control for quite some time, receiving annual colonists and magistrates all the way up until 433 BC.[197] Like his father, Periander also increased Corinth's influence over the northwestern coast of Greece by regaining control of Corcyra,[198] one of Corinth's oldest colonies that had since developed an animosity towards its parent city.[199] Soon after, Corinth and Corcyra jointly founded the colonies of Epidamnos and Apollonia along the eastern edge of the Straits of Otranto.

In addition to these efforts, Periander seems to have strengthened Corinth's relations with Lydia as Herodotus claims he sent 300 Corcyraean aristocrats to the region so that they could serve as eunuchs in the royal court of their king, Alyattes.[200] Herodotus also claims that Periander played a crucial role in brokering a peace deal between Lydia and the Greek city of Miletus sometime in the early 6th century BC.[201] In addition to Lydia, Periander seems to have developed close ties with Egypt, another important trade partner, particularly for its grain. This

is, in part, exhibited by the fact that Periander named his nephew and successor, Psamettichus after the contemporary Egyptian pharaoh, Psamtik I.[202] During Periander's reign, the Greek *emporion* or trading post of Naucratis, situated along the coast of the Nile delta was also established, the remains of which have yielded a number of wares and goods of Corinthian origin.[203] Beyond his foreign policy, Periander supported the merchant class even further through his domestic policy as he funded the construction of the Diolkos, a trackway that allowed commercial ships to be dragged across the isthmus between the Saronic and Corinthian gulfs. Periander also oversaw the construction of Corinth's artificial harbour at Lechaeum.[204]

As a whole, it was under the Cypselid tyrants that Corinth reached the peak of its commercial power. Corinthian 'black figure' pottery quickly became the most popular style of the period and was traded extensively throughout the Mediterranean.[205] It was also most likely under the Cypselids that Corinth began to mint its first coins.[206] It is quite possibly because of these commercial policies and the Cypselids' mercantile supporters that Herodotus, when talking about the bias against trade and manufacture, claims "all the Greeks have adopted this attitude, especially the Spartans, but the Corinthians have the least prejudice towards craftsmanship."[207]

Despite these efforts, over time the Cypselid tyrants' popularity began to wane. While Cypselus appears to have generally been an admired leader, his eldest son and successor, Periander seems to have had a more mixed reputation. On the one hand, he was respected enough

to have been asked to arbitrate the dispute between Athens and Mytilene in the late 7th century BC, over who should control Sigeum.[208] Several ancient sources also claim that Periander was one of the so-called seven sages of Greece.[209] On the other hand, however, authors like Herodotus and Aristotle claim that Periander was a ruthless leader who frequently executed his political rivals.[210] Herodotus additionally claims that Periander committed several other despicable acts like forcing all of Corinth's women to strip naked during the festival of Hera,[211] murdering his wife,[212] and having intercourse with her dead corpse.[213] One should be somewhat skeptical of these accusations however, as modern scholars have shown that it had become a common trope by Herodotus' time to portray tyrants in this way, committing various sexual misdeeds and other extreme taboos.[214]

The reputation of the last Cypselid tyrant, Psamettichus (c. 585-582 BC) seems to have been even worse than that of Periander. Psamettichus was never the ideal successor of Corinth's tyranny. We hear from our various sources that Periander's son, Lycophron, had always been the intended heir and was in fact on his way to Corinth to succeed his father, when he was tragically betrayed and killed by a group of Corcyraeans, wanting to recommence hostilities with their parent city.[215] As a result, Psamettichus was forced to succeed his uncle in a rather impromptu

manner. From our surviving sources, we hear little to nothing else about Psamettichus' reign, except that it lasted for a mere three years before he was assassinated and the Cypselid tyranny was officially brought to an end.[216]

After their successful coup against Psamettichus in 582 BC, the people (*demos*) of Corinth established yet another oligarchy in the city.[217] This oligarchy, however, seems to have been much broader than the system in place under the Bacchiadae as it appears that power was no longer considered strictly hereditary. We hear that under this new oligarchy, Corinth's entire citizen population was divided into eight tribes or *phylai*.[218] Each tribe could elect nine of its members to serve in the city's council or Boule. Each tribe could also elect one of its members to serve as a *Proboulos*, a magistrate who played a leading role in this decision-making body.[219] In addition to the Boule, more powers seem to have been allotted to those chosen to serve as Corinth's envoys or ambassadors. This was, in large part, due to the fact that under its new oligarchy, Corinth became a leading member of the Peloponnesian League, a network of alliances headed by Sparta (for more on the Peloponnesian League see pages 74-75). From our ancient sources, we hear that at the Peloponnesian League's meetings, Corinth's emissaries could play a major role in swaying the votes of various other member states and consequently, shape much of the political landscape of contemporary Greece.[220]

In addition to its council (Boule), Corinth was said to have had other governing bodies such as an assembly (called either σύλλογος or ἐκκλησία) where all citizens could at least in theory, voice their opinions and take part in politics, although it seems that in practice, these

governing bodies held little power.[221] Plutarch, for example, claims that "the Corinthians had a polity which leaned more towards oligarchy [ὀλιγαρχικώτερόν] and that they transacted little public business in their assembly of the people [τῶν κοινῶν ἐν τῷ δήμῳ]."[222] It is also worth mentioning that from our surviving literary and epigraphical sources, we know that during the Classical Period, Corinth had a number of other elected officials serving in its oligarchy such as *strategoi* who were in charge of leading the city's military or *grammatistas,* an eponymous magistrate in charge of managing civic affairs.[223] However, it remains unclear whether these positions were established already in the late Archaic Period (in the immediate aftermath of Psamettichus' assassination) or if they were only added to Corinth's political system later on.[224]

As a whole, this redistribution of power under Corinth's new oligarchy seems to have abated many of the social tensions that had plagued the city throughout the preceding centuries. By the end of the Archaic Period, Corinth had shifted away from being a city ruled by hereditary monarchs to become a politically stable city with the reputation of having a rather broad and just system of government.[225] This sentiment is perhaps best summarized by the late archaic poet, Pindar, when he stated:

> While I praise… [the Oligaithidai, one of Corinth's leading families], I shall recognize prosperous Corinth… There dwells Good Government [Eunomia] and her sisters, the secure foundation of cities: Justice [Dike] and Peace [Eirene], who were raised together with her, the guardians of wealth for men, the golden daughters of wise Law [Themis]. They are resolute in repelling Hubris, the bold-tongued mother of Disdain [Koros].[226]

Chapter 5
A History of Archaic Sparta: From *Stasis* to *Eunomia*

> "It occurred to me one day that Sparta, though among the most thinly populated of the states, was evidently the most powerful and most celebrated city in Greece; and I fell to wondering how this could have happened. But when I considered the institutions of the Spartans, I wondered no longer."[227]
>
> – Xenophon, *Constitution of the Spartans* 1.1.

The early Iron Age history of Sparta, at first glance, appears to have been much like that of its fellow Peloponnesian city-state, Corinth. According to our ancient sources, Sparta had been ruled by a number of legendary kings (*wanakes*) throughout the Bronze Age, the most famous of which was perhaps King Menelaus, the hero of the Trojan War who was the brother of Agamemnon and husband of Helen. Following the Bronze Age Collapse, we hear that the Peloponnese was invaded by Dorian Greeks and that Sparta's Atreid dynasty was overthrown and replaced by a series of kings (*basileis*) who were supposedly descended from Heracles himself.[228] Soon after the Dorians' arrival in the Peloponnese, Sparta's first Heraclid king (*basileus*), Aristodemus is said to have begotten twin sons with his wife, Argeia.[229] Because Sparta's monarchy relied on a system of primogeniture, this apparently caused a succession crisis as it was unknown which of the two twins, Eurysthenes and Procles, was born first. Consequently, the Spartans decided to make both of these twins their kings and thereafter adopted a form of government ruled jointly by their two monarchs.[230]

With that said, these ancient accounts of Sparta's early history appear rather suspect and, in all likelihood, are largely mythical. Little to no archaeological remains have been discovered in Sparta itself dating to the Bronze Age. One noteworthy exception is the so-called Menelaion, but this site is situated more than 4 km southeast of the city and is on the opposite side of the Eurotas river.[231] As a result, it is questionable whether 'Sparta' even existed in the Bronze Age, let alone was ruled by the various kings that we hear of from our later sources.[232] Instead, Sparta appears to have emerged as a city in the early Iron Age over the course of the tenth and ninth centuries BC as the four nearby villages of Pitana, Mesoa, Limnae and Cynosoura gradually grew in size and unified through the process of *synoikism*.[233] Later, during the early 8th century BC, a fifth village, Amyclae, also became part of Sparta.[234] Scholars have suggested that it was rather during this period of *synoikism* that Sparta's dual monarchy was established, perhaps as a compromise between the chieftains (*basileis*) of the two most powerful villages that later formed part of the city.[235]

Regardless of when the Spartans adopted their dual monarchy, this development appears to mark the first stage in the reduction of their kings' powers. Under this diarchic government, Sparta's two monarchs held equal authority and thus provided a greater system of checks and

balances than had existed before.[236] Moreover, the members of Sparta's two royal families, the Agiad and Eurypontid dynasties, seem to have been kept apart in some important ways.[237] For example, even though our sources describe several Spartan royal marriages and spousal relationships, including even cases of incestuous marriages within the same dynasty,[238] we curiously hear of no instances where an Agiad married a Eurypontid. This could indicate that the members of these two dynasties were not allowed to intermarry, perhaps in an effort to encourage a sense of rivalry between them or to hinder them from forming political alliances with each other and from collaborating on matters of state. From our surviving ancient sources, we in fact hear of several Spartan kings who fiercely rivalled each other and opposed the actions of their counterpart, such as King Eurysthenes and King Procles, the supposed founders of these two dynasties,[239] or King Cleomenes I and King Demaratus, Sparta's monarchs during the late Archaic Period.[240]

With that said, the creation of this diarchy does not seem to have achieved much in reducing the social tensions in Sparta at the time. Both Herodotus and Thucydides portray this period of early Spartan history as one full of political unrest or *stasis*.[241] As Sparta consolidated the surrounding region of Laconia under its rule, it developed a highly repressive system which

---

Herodotus *Histories* 5.75 & 6.50 tells us that up until the late Archaic Period, both of Sparta's kings had to go on military campaigns together and were required to agree on all decisions or matters of policy, before they could act on it. Therefore, Sparta's kings seem to have been able to essentially 'veto' each other up until this point.
[237] For example, their burial sites were kept separate according to Pausanias *Descriptions of Greece* 3.12.8, 3.14.2. According to Aristotle *Politics* 2.1271a, the Spartan political system depended on there being division between the two kings.
[238] Such as the Agiad marriage between King Leonidas I and his niece Gorgo (Herodotus *Histories* 7.239.4) or the Eurypontid marriage between King Archidamus II and his aunt Lampito (Herodotus *Histories* 6.71.2).
[239] Herodotus *Histories* 6.52.8, Pausanias *Descriptions of Greece* 3.1.7.
[240] Herodotus *Histories* 5.75, 6.50-51, 6.61.1, 6.64-65.1, 6.67 6.70 and Pausanias *Descriptions of Greece* 3.4.3-5. Several other ancient sources allude to when King Cleomenes I deposed Demaratus, although they do not explain this rivalry in as much detail, such as Xenophon *Hellenica* 3.1.6, *Anabasis* 2.1.3, 7.8.17, Diodorus Siculus *Library of History* 11.6, and Seneca *De Beneficiis* 6.31.4.
[241] Herodotus *Histories* 1.65.2 and Thucydides *History of the Peloponnesian War* 1.18

reduced much of its population into 'helotage,' a form of slavery or serfdom. Some estimates claim that for every Spartan citizen there could have been as many as seven helots.[242] Because Sparta's citizens were so heavily outnumbered, they were almost constantly concerned about maintaining the status quo and suppressing any helot revolts.[243] This tension was likely only exacerbated by the fact that in the late 8th century BC, after engaging in a twenty-year-long conflict, Sparta practically doubled in size by gaining control of the neighbouring region, Messenia, and subjugating much of its population into helotage as well.[244]

From our surviving ancient sources, we get the impression that the citizen-soldiers of various Greek city-states, like Sparta, were a major driving force behind the political changes of the early Archaic Period, since they were almost constantly occupied in wars at this time and therefore, increasingly wanted a role in the political decision-making behind these conflicts and sought certain benefits as compensation for their military service.[245] Aristotle, for example, provides this impression in his work *Politics*, when he claims that:

> Indeed, the earliest form of constitution among the Greeks after the kingships, was made up of those who were actually soldiers… [and] as states grew and the wearers of heavy armor had become stronger, more persons came to have a part in government.[246]

[243] Thucydides *History of the Peloponnesian War* 4.80.3, Aristotle *Politics* 2.1269a
[244] Michael Whitby, ed., *Sparta,* 8. So many people were reduced to helotage from this war, that the word 'Messenian' appears to have become a common synonym for 'helot,' as Thucydides tells us in *History of the Peloponnesian War* 1.101.2.
[245] Peter Krentz, "Warfare and Hoplites," 64. Hans van Wees, *Greek Warfare: Myth and Realities* (London, England: Bloomsbury Academic Press, 2004), 56-57. This may also be evidenced by the fact that in Sparta especially, the concept of citizenship seems to have been closely tied to military service. For example, we hear of several instances where helots were offered citizenship (probably the partial or quasi-citizenship of the *Perioeci*) in exchange for fighting in Sparta's wars, such as in Thucydides *History of the Peloponnesian War* 4.26.5-8, 4.80.3, 5.34.1, Xenophon *Hellenica* 6.5.28, and Athenaeus *The Deipnosophists* 6.271F.
[246] Aristotle *Politics* 4.1297b. Translation taken from: H. Rackham trans., *Aristotle's Politics,* Loeb Classical Library 264 (Cambridge, MA: Harvard University Press 1932), 343.

Therefore, it is perhaps due to the Spartans' perpetual state of war and their almost constant involvement in the suppression of the local helot population, that the next major change in Sparta's government occurred, the constitutional reforms of Lycurgus.

Lycurgus is an obscure figure in the early history of Sparta. Most scholars believe that Lycurgus lived sometime around the 8th century BC,[247] although some have argued that he was entirely legendary and thus, did not exist at all.[248] As a result, there is no clear-cut scholarly consensus on the matter. Furthermore, when discussing Lycurgus' constitutional reforms, one needs to be wary of the fact that our surviving ancient sources tend to attribute almost all of Sparta's customs or traditions to Lycurgus, even though we now know this was not the case. For example, several ancient writers like Xenophon and Herodotus claim that Lycurgus established the *syssitia* or the 'mess halls' where Spartan male citizens would dine together.[249] Given that mess halls are recorded to have existed in several other Greek city-states as well, particularly on Crete, it seems more likely that this practice of communal feasting was in fact much older, perhaps dating all the way back to the early Iron Age, before the Dorians migrated from the Greek mainland onto Crete, the Dodecanese, and the various promontories of Caria.[250] Similarly, Plutarch claims that Lycurgus outlawed the use of coinage in Sparta and instead, encouraged his

---

[247] This date is often derived from a variety of ancient authors. For example, Plutarch *Life of Lycurgus* 1.1-2 states that Aristotle, Timaeus, the so-called Disk of Iphitus, and other sources, all suggest Lycurgus lived around the time of the first Olympiad and Homer. By relying mostly on Ephorus, Strabo *Geography* 10.4.19 also claims that Lycurgus was a contemporary of Homer. Pausanias *Descriptions of Greece* 5.4.5 says Lycurgus lived during the first Olympiad. Thucydides *History of the Peloponnesian War* 1.18.1 suggests that Lycurgus' reforms occurred around 400 years before the end of the Peloponnesian War, which would put it around the late 9th or early 8th century BC. Cicero in *Pro Flacco* 63, claims that Sparta had been living under the same political system for 700 years, and in *De Republica* 1.9, he says Lycurgus reforms happened shortly before the reign of Romulus, which both suggest an 8th century date, etc. If Lycurgus wrote down his laws and, as far as we know, the Greek alphabet was adopted sometime around the 8th century BC (Pomeroy et al., 91), then this date appears to be the *terminus post quem*.
[248] Massimo Nafissi, "Lykourgos the Spartan 'Lawgiver': Ancient Beliefs and Modern Scholarship," in *A Companion to Sparta*, ed. Anton Powell, vol. 1 (Hoboken, NJ: John Wiley & Sons, 2018), 94-94.
[249] Xenophon *Constitution of the Spartans* 5.2 and Herodotus *Histories* 1.65.5.
[250] Pindar *Pythian Ode* 9.19, Aristotle *Politics* 2.1272a, Ephorus *BNJ* 70 F149 (as quoted in Strabo *Geography* 10.4.17), Dosiadas and Pyrgion as quoted in Athenaeus *The Deipnosophists* 4.143A-F.

fellow citizens to use iron rods as their currency.[251] This too seems highly unlikely, considering that the archaeological evidence suggests coinage had not even been invented yet in the early 8th century BC, when Lycurgus is generally thought to have lived.[252] Furthermore, in the opening lines of his *Life of Lycurgus,* Plutarch himself casts serious doubt on the historical reliability of his work and, by extension, of our ancient sources about Lycurgus overall, when he says:

> Generally speaking, it is impossible to make any undisputed statement about Lycurgus the lawgiver, since conflicting accounts have been given of his ancestry, his travels, his death, and above all, of his activity with respect to his laws and government; and there is least agreement about the period in which the man lived.[253]

Despite these challenges, there may be some things that we can infer from our ancient sources about the constitutional reforms accredited to Lycurgus or the so-called 'Great Rhetra.' For example, the laws attributed to Lycurgus seem to have played a significant role in organizing Sparta's citizens into a professional army.[254] Many sources such as Xenophon, Plutarch, and Pausanias, claim that Lycurgus established the *agoge*, the military education that each male Spartan citizen had to undergo throughout their youth, starting at the age of seven.[255] Aristotle similarly associates Lycurgus with the professionalization of Sparta's military, by claiming that he founded the *Crypteia,* an organization made up of Sparta's young adults who were tasked with brutalizing the local helot population every year, after the state had ritually declared war on them.[256] Perhaps our earliest source on this matter, Herodotus, also seems to have been under the

[256] As quoted by Plutarch in *Life of Lycurgus* 28. The nature and function of the Crypteia is also described in Plato *Laws* 1.633b-c, 6.763a-b, and Plutarch *Life of Cleomenes* 28. Plutarch seems to have been under the impression that

impression that Lycurgus made substantial contributions to Sparta's army, as he writes that "he established Sparta's military institutions, the platoons of citizens bound together by oath, [and] the companies of thirty."[257]

In exchange for their military service, Lycurgus is said to have given the Spartans several rights or privileges, many of which seem to have emphasized creating a sense of equality between citizens.[258] According to ancient writers like Polybius, Plutarch, and Justin, the Great Rhetra stipulated that each Spartan citizen was allotted an equal-sized portion of farmland by the state known as a *kleros*, as well as the necessary number of helot serfs to cultivate these lands.[259] Plutarch additionally tells us that male Spartan citizens were forced to live together in communal barracks until at least the age of thirty.[260] Xenophon similarly expresses this notion of shared property when he claims that Lycurgus gave Spartans the right to borrow slaves, hunting dogs, and horses from each other, whenever they wished.[261] He also claims that all citizens were permitted to discipline or punish the children of other Spartans as though they were their own.[262] This sentiment seems to be echoed in a number of other sources, which state that polyandry or 'wife-sharing' was permitted and was not an uncommon practice in Sparta either.[263] Above all,

---

the slaughter of 2000 helots described in Thucydides *History of the Peloponnesian War* 4.80.4, was performed by the Crypteia. When Herodotus claims in *Histories* 4.146.2 that the Spartans only performed executions at night, this could also be a reference to the nighttime actions of the Crypteia.

this notion of equality is perhaps best exemplified by the fact that several ancient sources refer to Spartan citizens simply as ὅμοιοι[264] or 'equals.'[265]

To a certain degree, these rights seem to have been extended not only to Spartan men, but to women as well. For example, in Sparta, female citizens, like their male counterparts, were provided with educations which included a physical education in sports and combat.[266] For this reason, Spartan women seem to have been well-known in antiquity,[267] particularly for their wits and clever quips.[268] Unlike other Greek city-states, Sparta also allowed female citizens to manage their own finances, own property, and inherit wealth from their parents.[269] In fact, this seems to have enabled at least a few Spartan women to become considerably wealthy and influential, for which they were referred to as the πατρούχοι or the 'heiresses.'[270] Aristotle tell us that by his day, these 'heiresses' had accrued so much wealth that they owned nearly two-fifths of all of Sparta's arable lands.[271]

With that said, it is important to bear in mind that this notion of Spartan equality was, by and large, illusory or a façade.[272] Although the Spartans had some notable customs and laws that created the appearance of equality, as a whole, Spartan society was extremely hierarchical and stratified, with well over half of its population reduced to helotage. Even within Sparta's citizenry itself, there appears to have been certain class distinctions as some families were

considerably more powerful and influential than others.[273] The 'heiresses,' for example, would have possessed significantly more wealth than the average Spartan woman. Likewise, even though female citizens were granted some noteworthy rights or powers in Sparta, this does not change the fact that Spartan society was patriarchal and, in general, privileged men over women. At this point, I should also reiterate that almost all of our literary sources on ancient Sparta were written, not by the Spartans themselves, but by outsiders who had a tendency to idealize or exaggerate certain aspects of Sparta's institutions and customs. Thus, one should be somewhat cautious of our descriptions of Spartan equality, as these descriptions may be, to some extent, the byproduct of their authors' wishful thinking or of the aforementioned phenomenon of the 'Spartan Mirage' (for more on this topic, see my discussion on pages 17-18).[274]

Perhaps the most significant reform accredited to Lycurgus, especially as it pertains to this study, is that he dramatically changed Sparta's system of government. A number of ancient authors such as Herodotus, Xenophon, and Plato, claim that Lycurgus established the Gerousia or Sparta's senate.[275] This council consisted of Sparta's two kings along with twenty-eight *gerontes* or elders over the age of sixty, who were elected into power by their fellow Spartans and thereafter, held the position for life. The primary function of the Gerousia seems to have been judicial as its members served as the jury during important court cases. Because each member of the Gerousia, including Sparta's two kings, could cast only a single vote and judicial decisions were based on a simple majority, the *gerontes* seem to have held considerable power in

[273] This is implied in: Plato *Laws* 3.696b, Aristotle *Politics* 4.1294b Ephorus *BNJ* 70 F149 (as quoted in Strabo *Geography* 10.4.16), Xenophon *Constitution of the Spartans* 7.3.

[275] Herodotus *Histories* 1.65.5, Xenophon *Constitution of the Spartans* 9.1-4, Plato *Laws* 3.691e-692a, Ephorus as quoted in Strabo *Geography* 10.4.18, Plutarch *Life of Lycurgus* 5.6, Justin *Epitome of Pompeius Trogus' Philippic Histories* 3.3.1-2, Tyrtaeus Fragment 4.

legal proceedings.[276] In addition to this, the Gerousia appears to have served as the city's main advisory body, tasked with counselling the Spartans and their kings on important matters of state.[277] Our sources suggest that in Sparta, political decisions or acts of legislation first needed to be approved by the Gerousia before they could be put to a vote in Sparta's citizen assembly (ἐκκλησία).[278] As a result, the creation of the Gerousia seems to have given at least some Spartans the opportunity to take part in politics and have a role in their government's decision-making. Having said that, it is important to bear in mind that this system was still by no means democratic. According to our sources, Sparta's citizen assembly would elect new *gerontes* through acclamation.[279] Aristotle considered this form of voting childish, probably because the existing members of the Gerousia who presided over these elections, could easily manipulate the results by claiming that their preferred candidate had received the loudest shouts.[280] For these reasons, even though in theory, every male Spartan citizen over the age of sixty was eligible to serve in the Gerousia, in practice, the *gerontes* seem to have all come from the same small number of aristocratic families.[281]

The final noteworthy change that Sparta's government experienced during the Archaic Period was when the office of the Ephors or 'overseers' was created. It is somewhat unclear when this position was established as some sources suggest that it was an invention of Lycurgus,[282] while others claim that it was founded later by Sparta's Eurypontid king,

Theopompus,[283] who ruled during the late 8th and early 7th centuries BC. Perhaps this is another example where our sources carelessly attribute an institution to Lycurgus, when in truth, these legal changes had developed gradually over the course of the Archaic Period. Regardless of when the Ephors were created, this development appears to have greatly reduced the power of Sparta's two monarchs. As their name suggests, the Ephors primary role was to oversee the kings and make sure they were kept in check. This function is perhaps best summarized by Xenophon, who tells us that every month Sparta's two kings were required to meet with the Ephors and swear before them to rule in accordance with the established laws of the state. In response to this, the Ephors would declare, "while you abide by your oath, we will keep the kingship unshaken."[284] In Sparta itself, the five Ephors regularly maintained watch over the kings and their affairs. Furthermore, during times of war or military campaigns, at least two Ephors would accompany the kings and their forces.[285] If, at any point, the Ephors felt that a king had neglected their duties or had broken the law, they had the ability to charge the kings with a crime and to serve as jury members in their trial alongside the aforementioned Gerousia. In fact, towards the end of the Archaic Period, the Ephors seem to have especially made use of this power as we hear that they charged both King Cleomenes I and King Leotychidas II for bribery in 494 BC and 476 BC respectively,[286] and prosecuted the Agiad regent, Pausanias for medizing in 478 BC.[287]

In addition to overseeing the kings, the Ephors seem to have served an important legislative role in Sparta's government. For example, after seeking approval from the Gerousia,

the Ephors were allowed to put political decisions or acts of legislation to a vote in Sparta's citizen assembly (ἐκκλησία).[288] Perhaps the most radical element of the Ephors was that each year they appear to have been selected, to some degree, at random from Sparta's adult male population. Plato for example, tells us that "the power of the Ephors came near to being a power conferred by lot [ἐγγὺς τῆς κληρωτῆς ἀγαγὼν δυνάμεως]."[289] Aristotle similarly alludes to this practice as he refers to the Ephors simply as οἱ τυχόντες[290] or 'whoever happens to be appointed'[291] and claims that this position was often held by individuals from Sparta's poorest families.[292] Because of these various powers or rights, many ancient authors seem to have been under the impression that the Ephors were Sparta's chief magistrates. Thucydides, for example, dates the events in his history not by aligning them with the reigns of Sparta's kings, but by providing the name of one of the Ephors of that year as though this position was equivalent to the Athenians' Eponymous Archon.[293] Likewise, Aristotle, when describing Sparta and the Ephors, writes that "this magistracy has authority over the highest matters."[294] Plato takes it a step even further by comparing the office of the Ephors to the rule of tyrants.[295]

Ultimately, by the end of the Archaic Period, the creation of the Gerousia and the Ephors seems to have caused Sparta's government to essentially become an oligarchy and Sparta's kings (*basileis*) to lose much of their powers. Whenever our ancient sources describe Sparta's kings and their function or privileges at home, we get the impression that their role was primarily

religious and symbolic as their duties mostly consisted of holding certain priesthoods, performing sacrifices, and consulting oracles.[296] The kings possessed their most authority during times of war when they were serving as Sparta's chief military leaders, but even then, their powers were limited as they were still overseen by at least two Ephors and, from the late Archaic Period onwards, only one king was allowed to leave the city and go on a military expedition at a time.[297]

While Sparta's government became increasingly oligarchical at home, it also began to pursue new foreign policies which encouraged the creation of oligarchies abroad, in other city-states too. As previously mentioned, in the early Archaic Period, the Spartans sought to increase their power by subjugating neighbouring regions like Messenia under their rule. Over time, however, this policy changed as the Spartans attempted to increase their influence more so through diplomacy. By the mid 6th century BC, Sparta had formed a network of alliances with a number of other city-states, known as the Peloponnesian League, the main objectives of which was to overthrow contemporary Greek tyrannies and replace them with pro-Spartan oligarchies.[298] Herodotus, for example, tells us that in 525 BC, the Peloponnesian League led an expedition to Samos in an attempt to overthrow the tyrant, Polycrates [299] while later in 510 BC, they successfully ousted the Peisistratid tyrant, Hippias from Athens (for more information on this particular event see pages 97-98).[300] Plutarch tells us that the Spartans additionally overthrew Lygdamis of Naxos, Aeschines of Sicyon, Symmachus of Thasos, Aulis of Phocis,

and the Cypselid tyrants of Ambracia.[301] Thucydides perhaps puts it the most succinctly when he simply says "but at last a time came when the tyrants of Athens and the far older tyrannies of the rest of Hellas were, with the exception of those in Sicily, once and for all put down by Sparta."[302]

It is also worth noting that as members of the Peloponnesian League, the Spartans appear to have regularly convened with their allies in an assembly (σύλλογος) where the delegates of each member state could deliberate and cast their vote on important political or military matters.[303] Therefore, by the late Archaic Period, the Spartans' foreign policy seems to have, to some extent, been shaped by the decisions that were determined collectively, by both themselves and their allies, in the assembly meetings of the Peloponnesian League.

In sum, although Sparta was able to maintain some semblance of its traditional monarchy, by the end of the Archaic Period it had, by and large, transformed into an oligarchy like its fellow Peloponnesian city-state, Corinth. The creation of the Gerousia and the Ephors appears to have given rise to a broader system of government, where more citizens could take part in Sparta's political decision-making than ever before. Moreover, the creation of the Gerousia and Ephors seems to have greatly reduced the powers or duties of Sparta's two kings (*basileis*), so much so that they were, henceforth, relegated to a primarily religious and symbolic role within Sparta itself. While Sparta's hereditary kings still held power outside of the city, especially in times of war when they would lead military expeditions, this privilege seems to have also been circumscribed by the late Archaic Period as only one king was permitted to leave

the city at a time and even then, he was required to bring at least two Ephors with him to oversee his handling of affairs. Finally, by the late 6th century BC, Sparta, as hegemon of the Peloponnesian League, seems to have made its important political decisions collectively, in conjunction with its allies and to have firmly committed itself to overthrowing monarchical governments (or 'tyrannies') in contemporary Greek city-states and replacing them with broader oligarchies.

Chapter 6
A History of the Athenian *Polis* to the Birth of 'Democracy'

> "Our constitution is called a democracy because power is in the hands, not of a minority, but of the whole people. When it is a question of settling private disputes, everyone is equal before the law; when it is a question of putting one person before another in positions of public responsibility, what counts is not membership of a particular class, but the actual ability which the man possesses. No one, so long as he has it in him to be of service to the state, is kept in political obscurity because of his poverty. And, just as our political life is free and open, so is our day-to-day life in relations with each other."[304]
>
> – Thucydides, *History of the Peloponnesian War* 2.37.1-2.

Even though Athens is the Greek city-state that we appear to know the most about, thanks to a number of surviving ancient literary sources and archaeological sites, its early Iron Age history is nevertheless shrouded in obscurity. According to our ancient sources, Athens was ruled by a number of legendary kings (*wanakes*) throughout the Bronze Age, the most famous of which was perhaps King Theseus, the hero who is said to have slain the Minotaur and established many of Athens' most important traditions or institutions.[305] Following the Bronze Age collapse, Athens' traditional Erechtheid dynasty was overthrown and replaced by the Melanthids, a family that supposedly originated from the Peloponnese but had been displaced by the recent Dorian Invasion.[306] In the end, the Melanthid dynasty's rule over Athens was rather short-lived as it only lasted until the reign of their second king, Codrus, who allegedly ruled around the time of the Ionian migration or the 11th century BC.[307]

According to our ancient literary sources, following the death of King Codrus, Athens' monarchy was officially abolished and replaced by an oligarchy.[308] Under this new form of government, the noble families of Athens, known as the Eupatridae, would elect one of their

members to serve as Perpetual Archon, a life-long position that essentially replaced the role of king.[309] As a result, our sources seem to describe this system functioning much like the aforementioned Bacchiad oligarchy of early archaic Corinth (for more on this topic see page 52). According to tradition, this Athenian oligarchy lasted for roughly three centuries until 752 BC, when it was slightly altered. Instead of serving for life, the Archons would, thereafter be elected by the Eupatridae to serve for ten-year terms.[310] Compared to the Perpetual Archons, these Decennial Archons' rule over Athens did not last long, as there would only be seven in total before the system was almost entirely remodelled in 682 BC. By this point in time, we hear that at least some of the Decennial Archons had developed a strong reputation for cruelty. The Decennial Archon, Hippomenes, for example, was known for having his own daughter, Leimone, killed after he had caught her having pre-marital intercourse. Hippomenes supposedly murdered her by locking her away in an empty house with a horse, so that when, after a while, the creature had become starving and desperate, it eventually devoured her.[311] Hippomenes is also said to have killed his daughter's lover in a rather brutal way too, by dragging him to death behind his chariot.[312]

Having said all that, most modern scholars concur that these traditions concerning the early history of Athens and the reign of their Perpetual and Decennial Archons, are, for the most part, mythical and contain little to no historical value.[313] As Michael Stahl and Uwe Walter put it:

> Such mythical stories tell us much about Athenian self-consciousness in the classical period and the construction of their identity from the late sixth century.

> But for the question of the beginning of a political organization or state in Attica, they have no value.[314]

In some ways, the unreliability of these traditions can be inferred from the very fact that the sources that record them, were written many centuries later and are full of internal inconsistencies or contradictions. For example, even though our sources claim that this new oligarchy was a broader system than the monarchy that preceded it and that it relied on at least some form of voting, they, at the same time, suggest that each of the Perpetual Archons were direct descendants of one another. Eusebius, for instance, declares that the first Perpetual Archon, Medon, was the son of Athens' final king, Codrus.[315] He then says that after Medon died, the Perpetual Archonship was passed onto his son, Acastus, who was then later succeeded by his son Archippus, and so on and so forth.[316] Similarly, we hear that this direct line of succession continued throughout the reign of the Decennial Archons until at least the reign of their fourth leader, Hippomenes (c. 723-713 BC).[317] As a result, it is entirely unclear from our sources how this early oligarchic government differed much at all from the monarchy that preceded it. This confusion is only further muddled by the fact that several ancient authors like Plato, Aristotle, and Pausanias refer to the Perpetual and Decennial Archons as 'kings' or *basileis*.[318]

Beyond these internal inconsistencies, our accounts also run into serious issues when compared to the archaeological record. For example, many ancient sources claim that Athens consolidated the surrounding region of Attica during the reign of their Erechtheid king, Theseus,

which would suggest that this all occurred in the Bronze Age.[319] Despite this, most modern scholars agree that in truth, Athens did not unify the surrounding region of Attica until more than a half millennium later, during the Late Geometric Period or the 8th century BC, when a series of roads were built linking the Athenian Acropolis to the Attic countryside as well as when a number of other Greek city-states were also showing signs of increased urbanization and *synoikism*.[320] In sum, much of what we hear from our ancient sources about the early history of Athens and its various forms of government has been called into serious question and should be treated with skepticism.

After the reign of the Perpetual and Decennial Archons, our ancient sources tell us that Athens' oligarchy was heavily reformed or restructured in 682 BC. At this time, the Archons' term of office was greatly reduced from ten years to just one.[321] In addition to this, the Eupatridae could now elect three of their members to serve as the city's chief magistrates. The first magistracy was the Eponymous Archon, the highest position of authority in Athens' government which was primarily responsible for managing civic affairs and bringing certain legal cases to trial.[322] The Eponymous Archon would spend their term of office dwelling in the *Prytaneum*, Athens' main seat of government where the city's central hearth was situated and each Eponymous Archon had their year of service named in their honour.[323] The second most powerful magistracy under this Athenian oligarchy was the Polemarch, tasked with leading Athens' military forces and making important war-time preparations or decisions.[324] The final

major office was that of the Archon Basileus, which, despite its name, was the least powerful of the three. The Archon Basileus primarily functioned as Athens' religious figurehead and would serve an important priestly role during certain festivals such as at the Anthesteria, where they were required to ritually hand over their wives to the god Dionysus (for more on this topic and how it may be related to the Phoenicians see pages 115-116).[325]

In addition to these three chief magistracies, we hear of several minor positions within this oligarchic government. For example, six members of the Eupatridae could also be elected to serve as Junior Archons or *Thesmothetae*, who were assigned to legislative roles in the city.[326] We also hear of positions such as the superintendents, treasurers, and clerks, although we seem to know less details about these positions, other than that they appear to have been elected through a show of hands at this time.[327] In addition to these various offices, all adult male Athenians who possessed more wealth than the lowest class of citizens, the *Thetes*,[328] were permitted to take part in their government's political decision-making by serving in the *Ecclesia,* Athens' popular assembly that would vote and deliberate on important matters of state.[329] Lastly, under this new Athenian oligarchy, former Eponymous Archons, Polemarchs, and Archon Basileis, became permanent members of the Areopagus, a council which, like Sparta's Gerousia, mainly served as an advisory body for the city's leaders and as a jury during important legal

proceedings, especially homicide trials (for more information on the similarities between the Areopagus, Gerousia, and other councils of elders in antiquity, see pages 119-122).[330]

Unlike the early Iron Age history of Athens, this development towards a broader, oligarchic government around 682 BC is well-attested and generally accepted as historical fact. For example, most modern scholars agree that by the early 7th century BC, the Areopagus hill does, in fact, appear to start being used as the site of Athens' homicide trials and other legal proceedings.[331] Moreover, archaeologists have discovered fragments of the original stele used by the Athenians up until the late 5th century BC to record the names of each of their annual Archons. Although the names of the Archons who ruled before 548 BC are no longer extant, based on what the surviving fragments of the inscription indicate about its overall length, scholars estimate that this list of names would have stretched considerably further back in time,[332] to around the early 7th century BC.[333] In addition to this, there is the so-called Parian Marble, a 3rd century BC stele that also provides the names of each year's Eponymous Archon in Athens. The inscription on this stele is preserved in much better condition and lists Athens' annual Archons as far back as Lysiadas, an individual who, according to the chronology, appears to have ruled in the year 682/681 BC, which is precisely when our sources say this system of annual Archons was introduced.[334]

Because this change in Athens' government in the early 7th century BC does appear to be well-attested and corroborated, unlike what we hear about earlier periods in Athenian history,

perhaps 682 BC, in truth, marks the year when Athens officially shifted away from its traditional monarchy towards its first ever oligarchy.[335] If this were the case, then it would certainly make more sense chronologically with what we hear was going on elsewhere in the Greek world at the time. As previously mentioned, it was only 65 years before this change in Athenian government that Corinth abolished its traditional monarchy and established its first oligarchy in 747 BC. Similarly, it was right around this time, in the late 8th or early 7th century BC that the Spartan king Theopompus was said to have established the office of the Ephors, thereby turning Sparta's government into a much more oligarchic system and relegating Sparta's kings to a primarily religious role in society, much like the role that the Archon Basileis seem to have served under this Athenian oligarchy. Having said that, it is important to note that some scholars prefer a slightly earlier date for the abolishment of Athens' monarchy, around the late 8th century BC. They argue that at this point, as the region of Attica was unifying through the process of *synoikism*, Athens' king along with the kings (*basileis*) of the other villages in Attica decided as a compromise, to relinquish their positions and establish a broader system of rule where power could be more evenly shared.[336]

Regardless of whether the Athenians abolished their monarchy in 682 BC, this year seems to mark an important stage in Athens' development towards a broader system of government. After these reforms, power no longer resided in the hands of a single ruler who reigned for a lengthy period of time, but was now distributed among several individuals who

occupied various annual positions or magistracies. Moreover, all but the lowest class of Athenian citizens now became eligible to serve at least some role in their government's political decision-making by being part of the *Ecclesia*. Having said that, it is important to bear in mind that this system was still far from democratic as only the members of Athens' noble family, the Eupatridae were permitted to run for the highest positions of power.[337] Moreover, because elections were achieved through a show of hands, votes were not kept anonymous and could therefore be influenced by one's peers or superiors.[338] Ultimately, while the creation of this oligarchy did lead to a broader system of rule, within just fifty of years of its existence, by the late 7th century BC, this system seems to have encountered some serious problems.

Our first indication of major political tension within this Athenian oligarchy appears around 632 BC with the so-called Cylonian Affair. According to ancient historians such as Herodotus and Thucydides, this event occurred when an Athenian aristocrat named Cylon, after accruing a great deal of popularity and support from the masses (thanks in large part to his recent victory at the Olympic Games), decided to launch a coup and seized the Acropolis with his followers in attempt to make himself the city's tyrant.[339] Although this coup was ultimately unsuccessful and Cylon's supporters were, by and large, put to death for their involvement in the conspiracy, this event nevertheless demonstrates a growing sense of political unrest or *stasis* in Athens at the time and appears to have loomed large over the subsequent decades as Athens' oligarchy began to soon push for various legal reforms.

[338] Matthew Simonton, *Classical Greek Oligarchy: A Political History*, 18-19, demonstrates that at this point in time, the *Ecclesia* was simply expected to ratify or approve of whatever was being proposed by the city's leaders.
[339] Herodotus *Histories* 5.71, Thucydides *History of the Peloponnesian War* 1.126, Plutarch *Life of Solon* 12.

The first major wave of legal reforms occurred just ten years after the Cylonian Affair, around 621 BC under the instigation of Athens' famous lawgiver, Draco. According to our sources, Draco was assigned by the Athenians to create the city's first ever written code of laws and to enact various reforms in an effort to abate the growing social tensions and factionalism.[340] On the one hand, Draco's laws had a reputation for being rather harsh, from which we get the meaning of the modern English word 'draconian.'[341] Aristotle, for example, goes so far as to say that, "there is nothing original worth mentioning about Draco's laws except their severity."[342] The main reason for this harsh reputation appears to have been due to the severe penalties that Draco imposed on those who had broken his rules. For instance, our ancient literary sources tell us that under Draco, even petty crimes like theft or idling were punishable by death.[343] Likewise, archaeologists have discovered a 5th century BC stele containing a copy of Draco's homicide law, which states that even those who were convicted of killing somebody by accident or without intent were to be permanently exiled from the city.[344]

On the other hand, Draco seems to have been remembered as a wise and well-respected lawmaker.[345] One reason for this, may have been because he was the first to commit Athens' laws to writing.[346] Prior to this, the laws of Athens appear to have been preserved orally by the

Archons,[347] who were therefore at liberty to distort the legal system to their advantage or to the benefit of their aristocratic clan, the Eupatridae.[348] By writing his laws down, however, and by permanently displaying them to the public on wooden tablets (*axones),* Draco appears to have done away with this system and created a greater sense of equality under the law or *isonomy*.[349] Perhaps Euripides summarizes this point best, when, in the *Suppliants,* he claims that:

> …a tyrant [is a man] in whose keeping and in his alone the law resides, and in that case, equality is at an end. But when the laws are written down, rich and weak [men] alike have equal justice, and it is open to the weaker [man] to use the same language to the prosperous [man] when he is reviled by him, and the weaker [man] prevails over the stronger [man] if he has justice on his side.[350]

Our ancient literary sources also tell us that Draco enacted several reforms that allowed Athenians who were not Eupatrids to have a larger role in government. For example, Draco is said to have allowed all adult male citizens possessing properties worth more than ten minae, to run for the archonship and to serve as treasurers.[351] Meanwhile, he declared all citizens with legitimate children and more wealth than 100 minae eligible to serve as *strategoi* and *hipparchoi*,[352] military positions that were subordinate to the Polemarch.[353] Lastly, Draco is said to have granted all male citizens over the age of thirty who could afford equipping themselves

---

[347] This seems fairly safe to assume, considering that it would have been impossible for the junior archons to have acted as *Thesmothetai* 'legislators,' or for former archons to have served as judges in the Areopagus, had they not known what the pre-existing oral laws were.

[348] "You see that the laws stand as they were originally written, whereas the words of rascals [τῶν συκοφαντῶν] are spoken to fit the day and the occasion."- Aeschines *Speech on the Embassy* 66. Translation taken from: C. D. Adams, trans. *Aeschines' Speeches.* (Cambridge, MA: Harvard University Press, 1919), 209.This sentiment is expressed in a number of other ancient sources too such as Xenophon *Cyropaedia* 8.1.22, Isaeus *On the Estate of Dicaeogenes* 25, or Solon as quoted in Aristotle *Constitution of the Athenians* 12.4.

[349] For more on the apparent benefits of written laws see Rosalind Thomas, "Writing, Law, and Written Law," in *The Cambridge Companion to Ancient Greek Law*, ed. Michael Gagarin and David Cohen (Cambridge, England: Cambridge University Press, 2005), 46-49.

with hoplite armour the right to be elected into the Boule, a new council of 400 citizens, which seems to have taken over some of the advisory duties of the Areopagus.[354] Perhaps this reveals that Draco's laws were designed, in part, to appease the city's citizen-soldiers, much like the aforementioned Spartan reforms of Lycurgus (see pages 65-68, for more on this topic).

With that said, one should bear in mind that our information on Draco's reforms is rather unclear and should all be treated with a degree of skepticism as our surviving ancient literary sources frequently contradict each other on the matter. For example, Aristotle's *Constitution of the Athenians* claims that Draco established Athens' council of 400, but then later, inexplicably, goes on to say that it was Solon who created Athens' first Boule,[355] a tradition that Plutarch seems to repeat in his *Life of Solon*.[356] In addition to this, all of our sources are likely being influenced by later events in Athenian history, such as when in 411 BC an oligarchic council of 400 citizens seized control of the city and tried to legitimize their rule by claiming that they were simply restoring one of Athens' oldest institutions.[357] This of course only further distorts our modern understanding of the history of Athens' early legal reforms. Lastly, one should always be wary of the fact that our ancient literary sources have a tendency to attribute almost all of a city's customs or institutions to a particular famous lawgiver (as we have already seen with the Spartan reforms of Lycurgus, described on pages 66-67).

In the end, Draco's laws do not seem to have succeeded in their goal of curbing Athens' growing social tensions or creating stability, as they would only last for around twenty-five years

[354] Aristotle *Constitution of the Athenians* 4.3.
[355] Aristotle *Constitution of the Athenians* 8.4.
[356] Plutarch *Life of Solon* 19.1.
[357] Thucydides *History of the Peloponnesian War* 8.65-69, Aristotle *Constitution of the Athenians* 31.1. Similarly, we hear that after Thrasybulus ousted the 'Thirty Tyrants' from Athens in 403 BC, he tried to legitimize his rule by also claiming that he was simply restoring the laws of Draco and Solon (Andocides *On the Mysteries* 81-83).

before being almost entirely repealed and replaced by a new wave of legislative reforms.[358] According to our ancient sources, in the year 594/3 BC, the Eponymous Archon Solon was compelled to create another series of laws in an effort to abate Athens' political unrest or *stasis*.[359] By this point in time, we hear that at least one major problem in Athens was that the lower classes were becoming increasingly unable to pay their debts, so much so that many citizens were being forced into debt slavery. In response to this, Solon is said to have abolished the practice of debt bondage and to have forgiven all existing loans.[360]

Like Draco, Solon is also said to have created various reforms which enabled more Athenians to take part in government. Solon reorganized the city's population into four economic classes, the *Pentakosiomedimnoi*, *Hippeis*, *Zeugitai,* and *Thetes*.[361] The wealthiest class, the *Pentakosiomedimnoi*, which consisted of individuals who earned more than 500 bushels-worth of grain each year, were given the exclusive right to serve as treasurers, Archons, and members of the Areopagus.[362] Meanwhile, the remaining magistracies were made available to the second and third highest classes, the *Hippeis* and *Zeugitai*, which consisted of individuals who earned more than 300 and 200 bushels-worth of grain respectively.[363] Those who belonged to the lowest class of Athenian citizens, the *Thetes*, remained excluded from political office, but were granted the right to serve as members of the *Ecclesia* and as jurors in the *Heliaia*, a newly-founded lawcourt which seems to have taken over some of the former duties of the Areopagus.[364]

As a whole, Solon's reforms appear to have earned him a great deal of popularity and admiration. Many ancient sources treat him as one of Athens' most important founding figures, while others even go so far as to claim that he was as one of the Seven Sages of ancient Greece.[365] Because Solon developed this legendary-like status in Athens, one needs to be very cautious of what our ancient sources claim as they may fall into the habit of misattributing various later reforms or institutions to him. For example, some sources suggest that Solon introduced the practice of selecting Archons and other magistracies by lot,[366] when, in truth, most modern scholars agree that this practice was not invented until almost a century later, perhaps as late as 487 BC.[367] This tendency in our ancient sources to view Solon as an almost proto-democratic lawgiver or as the direct precursor to the later reforms of Cleisthenes in 508 BC,[368] clouds our understanding of this historical figure. While we can certainly tell from the surviving fragments of Solon's own poetry that his reforms were, to some extent, designed to curb the unrestrained powers and actions of Athens' political elites,[369] we must also recognize that his reforms were, by no means, meant to fully empower the masses (*demos*) or uproot the status quo. In his poetry, Solon calls the people of Athens 'empty-headed [χαῦνος νόος]'[370] and says that the rights he established for them were sufficient, arguing that "the masses [δῆμος] would best follow their leaders if they are neither given too much freedom nor subjected to too

much restraint. For excess breeds insolence, whenever great prosperity comes to men who are not sound of mind."[371]

Despite these challenges, modern scholars agree that overall, this period of legal reforms under Solon does appear to have shifted Athens' government away from a system that prioritized the status of one's birth or family (i.e. the Eupatridae), towards a timocracy or a system that emphasized one's worth.[372] Under this new timocratic system, an Athenian's τιμή or 'worth' seems to have been determined not just by their personal wealth, but, to some degree, by their ability to serve as soldiers in the city's army, as the names of Athens' new social classes, like the *Hippeis* or *Zeugetai*, appear to have derived from various military classifications.[373] From this, perhaps we can assume that Solon's reforms were, in some ways, intended to appease Athens' citizen soldiers as well as its wealthy inhabitants (i.e. the *nouveaux riches*) who did not belong to the city's traditional aristocratic families and were therefore desirous of a larger role in politics.[374] With that said, in recent years some scholars have pushed back against the notion that in Archaic Athens, citizenship and status were primarily determined by calculating one's wealth or possessions. Alain Duplouy, for example, argues that citizenship was determined, not by carefully measuring one's worth, but by observing their behavior and the way they presented themselves in public. According to Duplouy, in order to be considered a 'citizen' in the Archaic Period, one needed to regularly participate in local sacrifices and religious festivals, adhere to the city's customs and traditions (*nomoi*), wear certain attire, and behave in a way that was befitting

of one's social standing.[375] Thus, perhaps we should view Athenian citizenship at the time of Solon not necessarily as a right or privilege that was allotted to people on the basis of their worth, but as a sort of performance that people were expected to participate in as a way of proving or displaying their wealth and status to the community.

Be that as it may, in the end, Solon does not appear to have accomplished enough to diminish Athens' growing political unrest or social tensions. We are told that after creating his constitution, Solon made all Athenians swear oaths to ratify and abide by his new laws.[376] He then left the city for a period of ten years, so that during this time, he could not be approached by any fellow Athenians wanting to convince him to repeal or abolish his acts of legislation.[377] Within these ten years of Solon's absence, we are told that at least twice, Athens fell into a period of anarchy, where they were unable to choose an Eponymous Archon for the year and were thus, forced to leave the position vacant.[378] Within these ten years, we are also told that there was an Eponymous Archon named Damasias, who refused to step down from his position after his term of office had expired and instead continued to hold the archonship for an extra fourteen months before eventually being violently deposed by his political rivals.[379] All of these anecdotes reveal that things were neither running smoothly nor going well in Athens in the immediate aftermath of Solon's reforms. By the end of his life, Solon would ultimately see Athens' oligarchy completely overturned when in 561 BC a distant relative of his, Peisistratus,

seized control of the city and reinstituted a form of monarchical rule by becoming Athens' first tyrant.[380]

According to our ancient sources, Peisistratus, like the Corinthian tyrant Cypselus, was able to seize power through demagoguery or appealing to the masses.[381] By the 6th century BC, we hear that three major political factions had emerged in Athens: the Men of the Plains, the Men of the Coast, and the Men of the Hills.[382] This last party appears to have been the most disenfranchised of the three as it mostly consisted of individuals belonging to the poorest class of Athenian citizens, the *Thetes.*[383] According to our surviving ancient sources, it was primarily through the support of the Men of the Hills that Peisistratus was able to seize power as Athens' tyrant in 561 BC.[384] Although Peisistratus would eventually be overthrown in 556 BC, he was able to return from his exile and rule over Athens twice more as tyrant, with his longest reign lasting from 546 BC to his death in 527 BC. Throughout his three reigns, Peisistratus seems to have maintained the avid support of the lower classes by pursuing various populist policies. For example, we hear that Peisistratus made it easier for lower class Athenians to own farmlands by refusing to tax their properties and by giving out generous loans.[385] We also hear that Peisistratus oversaw the construction of a number of public buildings in Athens such as the temple of Olympian Zeus,[386] the temples of Athena and Dionysus on the Acropolis,[387] the temple of Apollo

Patroos in the Agora, and more.[388] Peisistratus also established several public celebrations or festivities, the most famous of which was perhaps the Greater Panathenaic Games, Athens' quadrennial sporting competition.[389] Furthermore, he founded the Greater Dionysia, the festival that gave rise to Athenian drama and was therefore, another major source of public entertainment.[390] That said, I should, once again mention that in recent years, some scholars like Greg Anderson have argued against the notion that Greek tyrants were as popular and revolutionary as our ancient sources claim or that their efforts to gain the support of the masses (*demos*) were necessarily radical in comparison to the efforts of contemporary oligarchical leaders.[391]

Be that as it may, Peisistratus seems to have received a great deal of political support not only from Athens' *Thetes,* but from the local merchant class as well (much like Cypselus, as discussed on pages 55-56).[392] Various ancient literary sources like Herodotus or Aristotle, claim that Peisistratus was able to seize control of Athens for his second time by forming an alliance with Megacles, the leader of the mercantile Men of the Coast.[393] The support of Megacles and, by extension, the traders and merchants who formed the coastal party, seems to have been crucial for Peisistratus' tyranny.[394] Although Megacles' descendants, the Alcmaeonidae, would later claim that they were staunch enemies of the Peisistratid tyrants and were exiled from the city for

[394] When Peisistratus is described eventually falling out of favor with Megacles, he is soon overthrown and exiled from Athens according to Herodotus *Histories* 1.61.2, Aristotle *Constitution of the Athenians* 15.1. More famously in 510 BC, the Peisistratid tyrant Hippias was overthrown and exiled after falling out of favor with *Alcmaeonid*, Cleisthenes according to Herodotus *Histories* 5.63.1-2.

opposing their rule,[395] in truth, the aforementioned 5th century Archon List reveals that the Alcmaeonidae continued to faithfully serve under the Peisistratids, providing them with the invaluable support of the Men of the Coast, until at least 525/4 BC.[396]

If Peisistratus and his successors did indeed receive strong support from the local merchant class, then this would explain why they devoted so much effort towards various policies of commercial expansion throughout their reigns. For example, they appear to have strengthened Athens' ties with Macedonia, most likely in an effort to get more involved in the region's gold, silver, and timber trade.[397] Peisistratus himself would spend his second exile (556-546 BC) living along the timber-rich shores of the Strymon river and near the mines of Mount Pangaeus, which suggests that he already had close connections in the area by this time.[398] During his exile there, Peisistratus is also said to have founded the colony of Rhaecelus along the coast of the Thermaic Gulf.[399] Athens' relations with Macedonia seem to have only continued to grow under the rule of Peisistratus' sons, as we hear that Hippias, after being overthrown and exiled from Athens in 510 BC, was welcomed with open arms by King Amyntas I and offered to rule over the Macedonian city of Anthemus.[400] In addition to developing these close ties with Macedon, the Peisistratids strove for control over the Hellespont, most likely in an effort to get more involved in the Black Sea's grain trade.[401] Under Peisistratus' reign, Athens seized control

of the Greek city of Sigeum in the Troad and left it under the rule of Peisistratus' illegitimate son, Hegesistratus.[402] Peisistratus' successor, Hippias would further cement Athens' ties to the region by marrying his daughter Archedice off to Aeantides, the tyrant of Lampaskos, another major city in the Troad.[403] Under Peisistratus, Athens would also gain control of the opposite side of the Hellespont Strait, by invading the Thracian Chersonese, fortifying this peninsula, and leaving it under the rule of Miltiades the Elder.[404]

As a whole, it was under the Peisistratid tyrants that Athens became a major commercial power. Athenian 'red figure' pottery quickly became the most popular style of the period and was traded extensively throughout the Mediterranean.[405] It was also under the Peisistratids that Athens began to mint its first coins.[406] Lastly, during the reign of the Peisistratids, the Athenian Agora appears to have undergone some major developments. Prior to the 6th century BC, the Athenian Agora appears to have been a small unorganized space situated along the southern slopes of the Acropolis, which contained mostly residential buildings and was used primarily for gatherings of the *Ecclesia*.[407] During the 6th century BC, however, the Agora appears to have been relocated to its present position along the northwestern slopes of the Acropolis and transformed into a major public space and the commercial epicenter of the city.[408] The creation of this marketplace appears to have been accomplished, in large part, thanks to the efforts of the

Peisistratids, who marked the Agora's new borders with boundary stones,[409] built the marketplace's first fountain house, known as the *Enneakrounos*,[410] and established the Altar of the Twelve Gods, a structure that Pindar would later call the *omphalos* or 'navel stone' of the city.[411]

As a consequence of these efforts to appease Athens' merchant and lower classes, Peisistratus seems to have been remembered as a mild and well-respected ruler.[412] His two sons, Hipparchus and Hippias, however, have much harsher reputations in our surviving literary sources. For example, we are told that in 514 BC, Peisistratus' son Hipparchus made sexual advances on a young Athenian man named Harmodius. When his advances were rejected, Hipparchus decided to publicly humiliate Harmodius by declaring that his sister was not a virgin and was therefore, unworthy of participating in the festivities at the Panathenaic Games. Because of this humiliation and because he feared that Hipparchus would soon try to rape him, Harmodius, with the help of his lover, Aristogeiton, assassinated Hipparchus.[413] In the aftermath of this assassination, Hipparchus' brother Hippias started ruling over Athens with even more severity. We are told that Hippias became paranoid and began putting to death a number of Athenians whom he suspected of conspiring against him.[414] For example, we hear that Leaena, the *hetaera* or prostitute of one of the tyrannicides,[415] was ruthlessly tortured for her suspected

[415] Athenaeus *The Deipnosophists* 13.596F says she was the prostitute of Harmodius, but Polyaenus *Stratagems* 8.25 and Pausanias *Descriptions of Greece* 1.23.2 say that she was the prostitute of Aristogeiton. Meanwhile Plutarch *De Garrulitate* 8 seems to imply that she was the prostitute of both.

involvement in the plot against Hipparchus' life.[416] We also hear that Hippias was a rather avaricious tyrant, who was always devising new ways of raising more money for himself at the public's expense.[417] With that being said, one should treat all of these accusations with a degree of skepticism as it had become a common cliché by the 5th century BC to portray tyrants in this way, committing various atrocities and becoming increasingly despotic over the generations (as we've already discussed on pages 58-59, in regard to Corinth and its Cypselid tyrants).[418]

Regardless of whether these accusations of cruelty were true, within just four years of Hipparchus' assassination, Hippias seems to have quickly fallen out of favor with the Athenians. By 510 BC, the Alcmaeonid Cleisthenes had convinced the Spartans, as members of the Peloponnesian League, to come to Athens and overthrow the Peisistratid tyranny.[419] Although Hippias was able to flee the city during this uprising and later make several attempts to regain control of it, perhaps most famously at the battle of Marathon in 490 BC,[420] he would never again rule over Athens as tyrant. After deposing Hippias in 510 BC, we hear that the Spartans tried to establish a new oligarchy in Athens under the leadership of their close ally, Isagoras. When he attained the archonship in 508 BC, however, Isagoras and his pro-Spartan oligarchy seem to have soon crumbled apart. Isagoras' rule immediately received staunch opposition from Cleisthenes and his supporters, who had become a powerful political force in Athens by

[418] Thucydides highlights these tyrannical vices in *History of the Peloponnesian War* 1.17 and claims that all tyrants shared a lust for wealth.
The gradual decline or worsening of tyrannies over the generations is described in several ancient sources such as Aristotle *Politics* 5.1315b or Herodotus *Histories* 5.92. These sources summarize the era of Greece's tyrants in a way that is rather similar to Aeschylus' famous parable of the lion cub in *Agamemnon* 717-736. Like a lion cub, the tyrants first seemed gentle and friendly, but after being adopted, grew increasingly savage and feral.
[419] Herodotus *Histories* 5.63-65, Aristotle *Constitution of the Athenians* 19.3-6, Isocrates *Antidosis* 232, *Areopagiticus* 16.
[420] Herodotus *Histories* 5.96.1, 6.102, 107, 109.3. Another attempt by Hippias to regain power in Athens, following his exile in 510 BC, is described in Herodotus *Histories* 5.91.1-2, 93.2-94.1

appealing to the masses (*demos*) and advocating for radical reforms.[421] The situation became so dire for Isagoras that he summoned the Spartan king, Cleomenes I and his army back to Athens to forcibly remove the Alcmaeonidae and seven hundred of their strongest supporters from the city. After banishing Cleisthenes, Isagoras attempted to pass a law that would limit the size of Athens' Boule. Outraged by all of this, the Athenian people rose up against Isagoras and King Cleomenes' forces and besieged them on the Acropolis.[422] When the Spartans surrendered just three days later and agreed to leave Attica under truce, Cleisthenes returned to Athens and began instituting a series of radical constitutional reforms.

Above all, Cleisthenes appears to have passed laws that allowed more Athenians to participate in government. We hear that he offered citizenship to a number of Athenian slaves and *metics* (i.e. resident foreigners).[423] Cleisthenes is also said to have reorganized the city's population by dividing it into ten new tribes or *phylai* and by giving each tribe the right to elect fifty of their members into the Boule.[424] Moreover, each tribe could now choose one of their members to serve as their official representative, known as a *phylarch*, and could elect one of Athens' ten *strategoi* or 'generals,' a military position that seems to have become considerably more powerful at this time.[425] As a whole, our sources claim that Cleisthenes' reforms allowed the masses (*demos*) to gain substantial political power and control over Athens' government, on account of which this new system was called a democracy.[426]

Even though our sources portray Cleisthenes as this revolutionary father of democracy, in truth, the system he created very much resembled an oligarchy. Under this new system of government, Athens' traditional aristocratic families would continue to hold the highest positions of power and rule over the city, just as they had always done. Cleisthenes' own family, the Alcmaeonidae, for example, were a prominent aristocratic clan in Athens since at least the late 7th century BC,[427] and after Cleisthenes' reforms, would continue to dominate Athenian politics until at least the late 5th century, when we see figures like Pericles or Alcibiades.[428] Because this 'democratic' system did not allow slaves, women, children, or resident foreigners (*metics*) to vote, scholars estimate that up to 90% of Attica's population would have been excluded from politics.[429] Moreover, the space where political speeches and votes were held under this new democratic system, the Pnyx, is estimated to have been able to contain at most, around 6,000 people.[430] This means that it would have essentially been impossible for Athens' assembly meetings to have been attended by all adult male citizens, since, by the 5th century BC, there would have been around 30,000-50,000 of them in total.[431]

Lastly, it is worth mentioning that the most radical or 'democratic' institutions of this government were for the most part, established many years after the reforms of Cleisthenes. For example, a number of scholars have argued that ostracism, the right Athenian citizens had to vote to remove their politicians from power and exile them from the city, was not established by Cleisthenes but more than three decades later, in 487 BC, as this is the first known instance when

---

an ostracism occurred.[432] As previously mentioned, some scholars believe that it was also in this year (487 BC) that the practice of selecting archons and other magistrates by lot was first introduced.[433] Be that as it may, it seems that the most progressive reforms of Athens' democracy were introduced even later than this, during the Classical Period. For example, it was only during the *Pentecontaetia* or the mid 5th century BC that the property requirements to run for the archonship were lowered, the Areopagus council's powers were significantly reduced, and citizens were granted the right to receive daily wages for serving as jurors.[434] As a result, it is fair to say that at least during the Archaic Period (800-480 BC), Athens' 'democracy' in truth, resembled more of an oligarchical system than anything.

In conclusion, from the early Iron Age to the dawn of the Classical Period, Athens' government underwent several drastic changes. At first, Athens, like most other Greek cities, relied on a monarchical system of rule and was governed by a series of kings (*basileis*). Our surviving sources then tell us that Athens began to gradually develop towards an oligarchy by first introducing the office of the Perpetual Archon, later replacing it with the position of the Deccenial Archon, and by finally, reducing all magistracies to one-year terms. Out of these three developments, only the latter appears to have any historical basis as it can be corroborated by epigraphical evidence, which suggests that Athens did indeed develop an oligarchy with annual magistracies sometime around 682 BC. Even though the creation of this oligarchy did allow more Athenians to take part in government and did lead to a broader system of rule, by the end of the 7th century BC, it already seems to have encountered some major problems. We hear of

aristocrats like Cylon, trying to seize power over Athens by becoming the city's popular ruler or 'tyrant.' We also hear of the major constitutional reforms instituted by Athens' two famous lawgivers, Draco and Solon. In the end, both Draco and Solon's efforts seem to have all been in vain as they were ultimately unable to fix Athens' growing social problems or stave off its oligarchy's impending doom. By 561 BC, the city's government would be completely overturned, when the Athenians reinstituted a form of monarchical rule with Peisistratus and later, his two sons, serving as their tyrant. Peisistratus seems to have gained power, in large part, by championing the causes of the people and pursuing various commercial policies, but like Draco and Solon, his efforts do not seem to have accomplished enough to diminish Athens' political infighting or *stasis*. Moreover, the late 6th century BC appears to have given rise to an increasing disdain for tyrants, not just within Athens, but throughout the ancient Greek world (for more on this topic, see my discussion on the Peloponnesian League on pages 74-75). Eventually the Peisistratids would be overthrown in 510 BC, and in the aftermath of the ensuing power struggle, Cleisthenes would found Athens' first ever democracy. One should recognize that within the Archaic Period, however, this 'democratic' system still very much resembled an oligarchy. Nevertheless, it would be fair to say that as a whole, these developments show that Athens gradually progressed toward a broader and more collective system of rule over the course of the Archaic Period. Athens began this period under a monarchy, but by the end of it, was operating under a mostly oligarchic form of rule, just like Corinth and Sparta.

Chapter 7
A History of Phoenician Oligarchies: From the Late Bronze Age to the 5th Century BC

> "The Carthaginians are considered to have an excellent form of government, which differs from that of any other state in several respects, though it is in some [respects] very much like the Spartan. Indeed, the Spartan, Cretan, and Carthaginian states closely resemble one another and are very different from any others. Many of the Carthaginian institutions are excellent. The superiority of their constitution is proved by the fact that the common people [*demos*] remain loyal to it. The Carthaginians have never had any rebellion [*stasis*] worth speaking of, and have never been under the rule of a tyrant."[435]
>
> – Aristotle, *Politics* 2.1272b

Having demonstrated that as the Archaic Period progressed, the various city-states of ancient Greece increasingly turned away from their traditional monarchical forms of government towards broader systems of rule, I shall now discuss the history of the Phoenicians. The Phoenicians, like the Mycenaean Greeks, appear to have first been divided into various kingdoms during the Bronze Age, each of which were under the rule of a local monarch and his dynastic successors.[436] For example, inscriptional evidence suggests that the Phoenician city of Byblos was ruled by a series of kings stretching at least as far back as the 3rd millennium BC.[437] Meanwhile, Tyre and Sidon appear to have had longstanding monarchical governments throughout the Bronze Age as well, the earliest evidence of which comes from the 19th century BC.[438] This, to a certain extent, is not surprising as almost all of the major powers of the ancient Near East, such as the Egyptians, Babylonians, Assyrians, and Elamites, also relied on monarchical forms of government at this time.[439] What is perhaps more noteworthy, however, is that like Corinth, Sparta, and Athens, the city-states of Phoenicia appear to have gradually

reduced the powers of their kings in favor of adopting broader, oligarchical forms of government.

This chapter will provide a brief history of these political developments in Phoenicia and an overview of the surviving evidence of Phoenician oligarchies. In addition, I will draw close comparisons between these Phoenician political systems and the aforementioned political systems of archaic Greece. Perhaps most importantly, I will show that our surviving evidence indicates that this historical trend towards broader, oligarchical governments began several centuries *earlier* in Phoenicia than in Greece. This last point will be a crucial one for the sake of my thesis, as I will use it to argue that it is quite possible that the political developments of archaic Greece were in some ways inspired by these various Phoenician precursors or counterparts.

The earliest known evidence of the Phoenicians developing broader, potentially oligarchical political systems, comes from the late Bronze Age. At this time, the Phoenician cities of the Mediterranean coast were important allies or client states for the Egyptians, as they not only served as an important buffer zone against the more northern kingdoms of the Hittites and Mitanni, but also supplied the Egyptians with valuable trade goods such as cedar wood, textiles, carved ivory, finished metal objects,[440] and of course, the purple dye that the Phoenicians were famous for throughout antiquity.[441]

Perhaps our best sources of information on this period are the Amarna Letters of the 14th century BC, which are the official correspondences made between the Egyptian administration

---

[440] Sandro Filippo Bondì, "The Origins in the East," in *The Phoenicians*, ed. Sobatio Moscati (New York, NY: Abbeville Press, 1988), 29-30.

[441] The famous purple dye extracted from murex shells appears in the archaeological record of cities like Tyre, starting in the 16th century BC according to: Charlene Elliott, "Purple Pasts: Color Codification in the Ancient World," *Law & Social Inquiry* 33, no. 1 (2008), 178.

and its representatives or allies in the Levant. In addition to providing significant insight on the diplomatic relations between Egypt and its neighbours, these epistles reveal how various Phoenician cities were politically organized at this time. For example, we hear that Sidon was ruled by a king named Zimredda,[442] Tyre had a sovereign named Abi-Milku,[443] and Byblos similarly relied on a monarchical form of government, first under the reign of their king Rib-Addi,[444] and later under the reign of his brother, Ili-Rapih.[445] These kings seem to have served an important administrative role in their respective cities as they are frequently described forming their own political alliances,[446] waging wars,[447] and petitioning their causes directly to the Egyptian pharaoh Amenhotep III and later, his successor Amenhotep IV (also known as Akhenaten).[448]

That said, these Phoenician kings do not seem to have held absolute power over their cities, but to have operated under broader political systems. This is perhaps best illustrated through the diction or word choice of the Amarna letters, as some notably diverge from the standard formula of these correspondences. For example, in one letter, it is not the king of Irqata,[449] but "Irqata and its elders" who write to the Egyptian pharaoh and request military aid.[450] Similarly, there is an instance where Abi-Milku, the king of Tyre, complains to the

---

[442] Zimredda authors letters such as EA 144, 145 found in: William L. Moran, trans., *The Amarna Letters* (Baltimore, MD: John Hopkins University Press, 1992), 230-231. For brevity's sake I will, from now on, be referring to letters only by their EA number, but shall be relying solely on Moran's translation.
[443] Abi-Milku authors letters such as EA 146-155.
[444] Rib-Addi authors letters such as EA 68-95.
[445] Ili-Rapih authors letters such as EA 139, 140.
[446] Such as the political marriage between the king of Byblos and the king of Tyre described in EA 89 or the alliances that the king of Sidon and king of Beirut made with the Amurru according to EA 83.
[447] Such as Byblos' war against the Amurru recorded in EA 121, Sidon's war against the Apiru described in EA 144, or the hostilities between King Abi-Milku of Tyre and King Zimredda of Sidon reported in EA 146.
[448] King Rib-Addi of Byblos, for example, authored at least 64 of the 350 surviving Amarna letters according to: Louise M. Pryke, "The Many Complaints to Pharao of Rib-Addi of Byblos," *Journal of the American Oriental Society* 131, no. 3 (July-September 2011), 411.
[449] King Aduna of Irqata is mentioned in both EA 75 and 140.
[450] EA 100

Egyptian pharaoh about how King Zimredda of Sidon had formed an alliance, not with Arwad's respective king, but with the "men of Arwad," as a whole.[451] This curious phrasing seems to parallel a letter written by the king of Byblos, Rib-Addi, who laments that the city of Sumur was being attacked on the one hand, by the "sons of Abdi-Ashirti" (the king of Amurru), but on the other hand, by the "people of Arwad" collectively.[452] In fact, out of the entire corpus of the Amarna letters, we interestingly hear no mention whatsoever of a king ruling over the Phoenician city of Arwad.[453] Perhaps the most revealing or insightful letter on the topic of Phoenician government, is one written by King Rib-Addi of Byblos, who claims that although he wanted to form an alliance with King Hammuniri of Beirut, the "people of Byblos" insisted on forming an alliance with King Aziru of Amurru instead. Because of this, when Rib-Addi left for Beirut to exchange his new oaths of friendship, the "people of Byblos" decided to go behind their king's back and form an alliance with King Aziru of Amurru, on their own initiative. Later, when Rib-Addi returned from Beirut, he claims that the "people of Byblos" locked him out of his own city and forced him to live in exile with his new Beirutian allies.[454]

Apart from these examples, there are some other passages that are perhaps also worthy of mention, although they are admittedly more contentious or disputed. For instance, some scholars believe that one of the surviving Amarna letters was written to the Egyptian pharaoh by the "people of Byblos" as well.[455] This, however, is rather controversial as the text is highly fragmentary and consists of several lacunae. In truth, the opening lines of this letter, which would have clearly identified the writer, are illegible, leaving the authorship of this text a

mystery.[456] Another controversial passage which may indicate that Phoenician monarchs did not hold complete authority over their cities, but shared power in some sort of broader political system, is a letter written by King Aziru, who complains about how the "magnates" of the Phoenician city of Sumur have been thwarting his political efforts.[457] The crux of the debate here is whether the "magnates" referenced in this passage should be understood to mean a group of local, Phoenician politicians who held sway over Sumur,[458] or if instead, it is simply referencing certain officials or administrators stationed in Sumur by the Egyptians themselves.[459] The last letter that is perhaps worth mentioning, is one that is written not by Tunip's king,[460] but by the "citizens of Tunip," who request military aid from the Egyptian pharaoh and claim to have written several other (now lost) letters as well.[461] The controversy surrounding this passage however, is that although many scholars have argued that Tunip was, in all likelihood, a city situated in northern Phoenicia,[462] its precise location remains unknown and is a topic of debate.[463]

As a whole, the abovementioned examples taken from the Amarna letters have been used by some scholars to argue that by the late Bronze Age, a few Phoenician city-states had even

[463] Michael C. Astour, "Tunip-Hamath and Its Region: A Contribution to the Historical Geography of Central Syria," 51.

developed broad, non-monarchical forms of rule.[464] This conclusion, however, is rather problematic. First of all, just because our surviving literary sources do not mention any kings ruling over certain Phoenician cities, like Arwad, does not mean that we can assume these cities, therefore, did not have monarchical governments, but more collective systems of rule. Secondly, even if one were to, for argument's sake, take the most charitable interpretation of a letter like EA 157 and assume that the Phoenician city of Sumur was indeed governed by a group of local 'magnates,' we still know absolutely nothing about *how* these officials attained their political positions to begin with. This is a crucial question that needs answering before any serious conclusions can be drawn about whether Sumur's government truly was a broad-based collective form of rule, as it is quite possible that these various 'magnates' were not elected by the city's citizenry or by the larger public at all, but were instead appointed by a very narrow group of aristocrats (which as we have already seen occurred in early archaic Corinth and Athens under the Bacchiadae and Eupatridae respectively).

While it is impossible to say whether the Amarna letters demonstrate the existence of broad non-monarchical governments in late Bronze Age Phoenicia, it is fair to say that they, at the very least, demonstrate that some Phoenician cities operated under political systems that were noticeably broader than any absolute monarchy.[465] Phoenician kings do not seem to have held complete control over their respective cities but could, in some cases, clearly face substantial opposition at home. Moreover, several letters appear to deliberately break convention and use broader, more collective language, which seems to indicate that some Phoenician cities had

---

[464] As argued in: Stephen Stockwell, "Before Athens: Early Popular Government in Phoenician and Greek City States," 126-127. Or perhaps more infamously in: Martin Bernal, *Black Athena Writes Back*, ed. David Chioni Moore (London, England: Duke University Press, 2001), 356-357.

[465] Anson F. Rainey, "Amarna and Later: Aspects of Social History," in *Symbiosis, Symbolism, and the Power of the Past: Canaan, Ancient Israel, and Their Neighbors from the Late Bronze Age through Roman Palaestina*, ed. William G. Dever and Seymour Gitin (State College, PA: Pennsylvania State University Press, 2003), 172-173.

official governing bodies or councils that at times could make their own political decisions.[466] The precise nature of these councils, however, is left rather obscure or vague. It is only by examining later evidence from the Iron Age that our understanding of this topic becomes more clear. Nevertheless, the Amarna letters are worthy of consideration, especially since they were written at a time when the Greeks were still firmly under the rule of their Mycenaean kings or *wanakes*, indicating that the movement towards broader, more collective governments seems to have begun several centuries *earlier* in Phoenicia than in Greece.

One of the earliest pieces of evidence from the Iron Age that provides important insight into the structure of Phoenician governments is the so-called Report of Wenamun. This 11th century BC text recounts the travels of an Egyptian priest named Wenamun to the Phoenician city of Byblos in order to retrieve cedar wood. Along his way, Wenamun suffers a number of misfortunes that each delay or prolong his trip and when he finally arrives in Byblos his struggles continue there as well. The report claims that after Wenamun met with the Byblian king, Zakerbaal, and made his request for lumber, the king summoned a meeting of his 'assembly.'[467] The purpose of this 'assembly' meeting was to debate whether they should comply with Wenamun's solicitations or instead extradite him to the Tjekker, a neighbouring people demanding his arrest. During this meeting, King Zakerbaal reveals that he is rather hesitant to arrest Wenamun as he is, after all, a guest and the priest of a very powerful deity (Ammon). Nevertheless, King Zakerbaal appears to be forced into a compromise as he agrees to let

[466] This is, perhaps, not too dissimilar from the sort of collective language that we see appearing on Athenian inscriptions, following the creation of their democracy in 508 BC. For more on the topic of Athenian inscriptions and their emphasis on the fact that decisions were being made collectively by the Boule and people of Athens see: Anna Missiou, *Literacy and Democracy in Fifth-Century Athens* (New York, NY: Cambridge University Press, 2011), 90-100.

[467] Report of Wenamun 2.71 found in: Miriam Lichtheim, ed*., Ancient Egyptian Literature Volume II: The New Kingdom* (Oakland, CA: University of California Press, 2019), 567.

authorities pursue Wenamun immediately after departing from Byblos' harbour. The events recorded in the Report of Wenamun seem to demonstrate that at this time, the king of Byblos did not hold complete power over his city, but instead shared it in a broader, potentially oligarchical political system.[468] Kings like Zakerbaal appear to have been expected to consult their 'assembly' before making important political decisions and the members of this advisory body quite possibly held enough power to convince the king do something he really did not want to do.

The existence of this broader, potentially oligarchical political system in Byblos appears to be corroborated by the near contemporary coffin of the Byblian king, Ahiram. This 11th century BC sarcophagus contains an inscription that not only cautions any future kings from opening the coffin, but future 'governors' and 'commanders' of Byblos' army as well.[469] This inscription is worthy of consideration as it, like the Report of Wenamun, seems to indicate that the kings of Byblos at this time, did not hold complete authority over their city but shared it in a broader political system with various other important offices or magistracies.[470] Moreover, the fact that there appears to be three chief magistrates of the city, a 'governor' in charge of civic administration, a 'commander' in charge of the military, and a 'king' is noteworthy as it appears remarkably similar to the tripartite division of power that we later see in the oligarchy of archaic Athens, with its Eponymous Archon, Polemarch, and Basileus (which I have already discussed on pages 80-81).

[469] Ahiram inscription, as found in: John C. L. Gibson, *Textbook of Syrian Semitic Inscriptions Volume III: Phoenician Inscriptions* (Oxford, England: Clarendon Press, 1982), 14.
[470] Sandro Filippo Bondì, "Political and Administrative Organization," 126.

Unfortunately, we have very little information about Phoenician political systems from the period immediately following the Report of Wenamun and Sarcophagus of Ahiram, specifically the 10th and 9th centuries BC. In fact, this lack of evidence has, in and of itself, led some scholars to believe that Phoenician monarchs were less important at this time as they, unlike most contemporary Near Eastern kings, seem to have made little effort to publicly flaunt their wealth or record their achievements.[471] If we are to trust our later ancient literary sources and what they have to say about this period of Phoenician history, we get a rather similar impression that kings grew increasingly less powerful or important over time. For example, even though the Tyrian king, Hiram I (980-947 BC) is described as a dominant and influential political figure,[472] we hear little to nothing about the exploits of any of his successors.[473] From this, scholars like Robert Drews have concluded that, "…after Hiram in the tenth century they [the kings of Tyre] are not imposing figures."[474]

The circumstances in Phoenicia at this time were perhaps not too dissimilar from neighbouring Syria, where there appears to have been a number of small Aramean polities throughout the early Iron Age, each of which were ruled by relatively minor kings, whose names and deeds are preserved, not so much in the inscriptions of the Arameans themselves, but in the scanty references of the nearby Assyrians and Luwians.[475] Moreover, these Aramean kings, like

---

[471] Maria Eugenia Aubet, *The Phoenicians and the West: Politics, Colonies, and Trade,* 144-145.
[472] Josephus *Against Apion* 1.17-18, *Jewish Antiquities* 7.65, 8.50-57, 141, 160. Our biblical sources for King Hiram include 1 Chronicles 14:1, 1 Kings 5, 7, 9, 10:11, 2 Samuel 5:11.
[473] For example, see how much information Josephus (quoting Menander of Ephesus) provides about Hiram in contrast to the other Tyrian kings in *Against Apion* 1.18.
[474] Robert Drews, "Phoenicians, Carthage, and the Spartan Eunomia," *The American Journal of Philology* 100, no. 1 (1979), 47. This assertion is reiterated in: Stephen Stockwell, "Before Athens: Early Popular Government in Phoenician and Greek City States," 127. This opinion, however, is not universally accepted as others have argued that Tyre's kings only started losing their importance after the reign of King Luli in the late 8th century BC, as seen in: Maria Eugenia Aubet, *The Phoenicians and the West: Politics, Colonies, and Trade,* 145.
[475] K. Lawson Younger, *A Political History of the Arameans: From Their Origins to the End of Their Polities* (Atlanta, GA: Society of Biblical Literature, 2016), 109, 157.

their Phoenician counterparts, do not seem to have held absolute power over their kingdoms, but shared it with other officials and governing bodies in broader systems of rule.[476] For example, inscriptional evidence suggests that throughout the 10th century BC, the city of Carchemish was ruled by its 'Great King' in conjunction with its 'Country Lords.'[477]

Be that is it may, the little information that we do receive about Phoenician kings from the early Iron Age, gives us the impression that their role in society was, in large part, religious or priestly. This, to a certain extent, is not surprising considering the long history of similar 'priest-kings' in the Ancient Near East, especially the various city-states of Mesopotamia.[478] In fact, some scholars such as Piotr Steinkeller have argued that the earliest kings of Uruk and the other Sumerian city-states of the late 4th millennium BC primarily drew their power and authority from serving as the priests of important local goddesses.[479] Thus, the sacerdotal function of Phoenician kings in the early Iron Age likely represents a much broader trend or older tradition of kings behaving in this way throughout the Bronze Age Near East.

At the Phoenician city of Byblos, we get the impression that early Iron Age kings served a priestly function in society, mainly from our surviving epigraphical evidence. For example, all four of the so-called Royal Byblian Inscriptions from the 10th century BC are epigraphs commemorating either a dedication or construction made by the king in honour of the city's patron deity, Baalat Gebal.[480] Out of these four epigraphs, the Yehimilk inscription is perhaps the

most noteworthy as it not only invokes Baalat Gebal, but her consort, the supreme sky god Baal Shamin, along with an "assembly of the holy gods of Byblos."[481] The reason why this could be of interest, is because the Byblians may very well be portraying their pantheon of gods – ruled not just by a divine king and queen but an 'assembly' of other deities – as operating in the same way as their own political system or government at this time. The tendency that people have for portraying their gods as ruling under the same power structures or social conditions as their own, is perhaps best summarized by Aristotle at the beginning of his *Politics* when he writes:

> [The reason] why all races speak of the gods as ruled by a king, [is] because they themselves too are some of them actually now so ruled and in other cases used to be of old; and as men imagine the gods in human form, so also they suppose their manner of life to be like their own.[482]

Leaving this topic aside, the close connection between the kings of Byblos and their city's tutelary divinity seems to have continued well into the 5th century BC, as evidenced by inscriptions like the Yehaumilk Stele, which likewise commemorates dedications made by the Byblian king in honor of Balaat Gebal.[483]

The circumstances surrounding Tyre and its monarchy during the early Iron Age, appear to have been much the same as its kings also seem to have served as the city's chief religious officials. For example, some of the major feats attributed to the aforementioned 10th century BC king, Hiram I, include constructing the temples of Tyre's patron deities, Melqart and Astarte, establishing Melqart's main festival, the *Egersis,* rebuilding several older temples in the city, and

making dedications to the god Baal.[484] Similarly, our sources refer to the 9th century BC Tyrian king, Ithobaal I, as a 'priest of Astarte'[485] and his grandson, Sychaeus (also known as Acerbus), as a 'priest of Melqart.'[486] Perhaps this also explains why Ithobaal's daughter, Jezebel, is portrayed in biblical accounts promoting the cult of Melqart so adamantly, especially to King Ahab and the Israelite royal family.[487] The connection between Tyre's monarchy and the cults of Melqart and Astarte seems to be corroborated by a 7th century BC treaty made between the Neo-Assyrian King Esarhaddon and King Baal of Tyre, which makes sure to invoke both of these deities in its closing lines.[488]

Finally, the kings of Sidon appear to have also had a close connection with their city's tutelary gods, Eshmun and Astarte. This is perhaps best demonstrated through the inscriptions found on the sarcophagi of Sidon's 6th century BC kings. For example, the epitaph found on the coffin of Eshmunazar II, boasts that he and his mother funded the construction of the city's main temple of Eshmun.[489] This construction project seems to have continued later under the rule of his successor King Bodashtart as well, according to our surviving epigraphical evidence.[490] What is perhaps more noteworthy, is the inscription found on the sarcophagus of King Tabnit, who not

[484] Menander of Ephesus claims that Hiram constructed Melqart and Astarte's temples, as quoted in Josephus' *Against Appion* 1.18 and *Jewish Antiquities* 8.146. Both Menander of Ephesus and Dius also claim that Hiram was famous for rebuilding several temples in Tyre and making dedications to Baal, as quoted in Josephus' *Against Appion* 1.17-18 and *Jewish Antiquities* 8.145, 147.
[485] Menander of Ephesus as quoted in Josephus *Against Appion* 1.18.
[486] Justin *Epitome of Pompeius Trogus' Philippic Histories* 18.4.5. Although it is never said explicitly, it is strongly implied that Sychaeus was a priest in Virgil *Aeneid* 1.349 and Ovid *Heroides* 7.97, as he is described being killed in front of an altar (presumably while conducting his usual sacrifices).
[487] 1 Kings 16:32, Josephus *Jewish Antiquities* 8.317-318. In these accounts, Melqart is called Baal of Tyre, a title for the god which is also found on several Phoenician inscriptions. For more on this topic see:
Richard J. Clifford, "Phoenician Religion," *Bulletin of the American Schools of Oriental Research*, no. 279 (August 1990), 59-60.
[488] ANET[3] 533-534, the translation of which can be found in: James B. Pritchard, ed., *The Ancient Near East: An Anthology of Texts & Pictures* (Princeton, NJ: Princeton University Press, 2011), 212-213.
[489]Eshmunazar II inscription as found in: John C. L. Gibson, *Textbook of Syrian Semitic Inscriptions Volume III: Phoenician Inscriptions,* 107-109.
[490] Such as the Bodashtart inscription found in: John C. L. Gibson, *Textbook of Syrian Semitic Inscriptions Volume III: Phoenician Inscriptions,* 117.

only refers to himself and his predecessor, King Eshmunazar I, as a 'priest of Astarte,' but even goes so far as to put this designation before their title of king.[491] Perhaps this indicates that the primary function of Sidon's kings was to serve as the city's chief religious official or act as an intermediary between the divine and human realms.

In addition to the abovementioned evidence, it is worth taking note of the fact that almost all Phoenician kings seem to have had theophoric names that denoted their roles as priests or religious officials. For example, we frequently come across kings with names like Adonibaal ('my lord is Baal'), Abdastartus ('servant of Astarte'), Eshmunazar ('helper of Eshmun'), and so on.[492] The Phoenician word for king (*mlk*) is even the same word used for the verb 'to sacrifice.'[493] Moreover, scholars believe that Phoenician kings served an important sacerdotal role during religious festivals and were particularly involved in the performance of a *hieros gamos* or 'sacred marriage' with the patron goddess of their city.[494] At Byblos, this ritual is alluded to in epigraphs like the 10th century BC Safatba'al inscription or the 5th century BC Yehaumilk Stele, where the king appears to address the goddess, Baalat Gebal as his wife or consort.[495] Meanwhile, in the city of Tyre, kings appear to have performed a 'sacred marriage' to Astarte during the *Egersis*, a springtime festival held in honour of Melqart's annual death and rebirth.[496] On the second day of this three-day celebration, the king and queen would assume the roles of Melqart and Astarte respectively and perform a *hieros gamos* which presumably involved having intercourse with one another as a way of ensuring the earth's fertility in the

upcoming planting or sowing season.[497] It is quite possible that a rather similar festival was also held at the Phoenician city of Sidon in honour of its chief deities, Eshmun and Astarte.[498] Unlike at Tyre, however, it is impossible to say if this festival and its *hieros gamos* were practiced at Sidon already in the early Iron Age, as our best evidence for them only come from a Sidonian marble vase from the 4th century BC.[499]

The religious or priestly role of Phoenician kings is worthy of consideration as it appears remarkably similar to the function that Greek kings (*basileis*) served in their respective city-states, especially as the Archaic Period progressed. For example, I have already shown that, after the constitutional reforms of Lycurgus and Theopompus, Sparta's kings were increasingly relegated to a religious role in the city and became mainly in charge of things like holding certain priesthoods, performing sacrifices, and consulting oracles.[500] Perhaps an even closer comparison to Phoenician kings would be the Archon Basileis of Athens. These 'kings' like their Phoenician counterparts, not only served a priestly role in society, but appear to have been particularly involved in the performance of a *hieros gamos* during the *Anthesteria*, a festival that was perhaps not too dissimilar from the Phoenician *Egersis*. Like the *Egersis*, the *Anthesteria* was a three-day-long festival held in the spring that seems to have been closely related to agriculture and the growth of new vegetation (with the name of the festival itself, coming from the Greek verb ἀνθεῖν 'to blossom' or 'to flower').[501] The sacred marriage performed at this Athenian festival

required both the 'king' and 'queen' to play the roles of Dionysus and Ariadne respectively and presumably consummate the marriage through intercourse.[502] This is noteworthy as much the same has been said or argued about Phoenician kings and how they conducted their respective sacred marriages.

Finally, even though the Greek cities of Corinth, Athens, and Sparta are certainly the main focus of this thesis, it is worth briefly mentioning that similar priestly 'kings' or Archon Basileis appear elsewhere in the Hellenic world during the Archaic Period as well.[503] For example, in the so-called Constitution of Chios, a stele from the early 6th century BC that clearly describes a democratic system of government on the island (ruled by a council of *demarchoi*), we hear that there were certain 'basileis' in charge of collecting tithes and dedicating them to the goddess Hestia.[504] The religious role of these 'kings' seems to be confirmed by a later 4th century BC inscription from Chios that outlaws pasturing at the grove of a nearby sanctuary, as the inscription claims that all violations of this sacred space, should be reported to the local *basileis*.[505] Even in Rome, a city on the periphery of the Greek world, we can see a rather similar trend occurring. Although the Romans abolished their monarchy in 510 BC, they nevertheless made one of their republic's highest religious officials a 'king' of some sort, known as the *rex sacrorum*.[506] This priesthood was solely held by those belonging to Rome's noble families, the

patricians,[507] who appear to have been the Roman equivalent to the Athenian Eupatridae (i.e. those who held the hereditary right to serve as Archon Basileus).[508] In sum, over the course of the Archaic Period, not only Athens and Sparta, but cities throughout the Greco-Roman world seem to have increasingly relegated their 'kings' to a religious role in society, a role that is not too dissimilar from the one we see Phoenician kings serving throughout the early Iron Age.

Fortunately, by the late 9th century BC, our sources for the Phoenicians and their political systems become more numerous thanks in large part to the growing influence of the Neo-Assyrian Empire. Throughout the 9th century BC, the Phoenicians seem to have frequently interacted and traded with the Assyrians. We hear of several Phoenician cities giving gifts of valuable trade goods such as gold, ivory, and dyed textiles to Neo-Assyrian kings,[509] and we even hear that King Ashurbanipaal II invited 'delegates' from Sidon and Tyre to the opening of his new palace at the Assyrian capital of Nimrud in 879 BC.[510] Be that as it may, throughout the 9th century BC, the Neo-Assyrian Empire seems to have been kept relatively at arm's length and to have been only a looming presence for the Phoenicians.[511] It was only during the 8th century BC, after the defeat of the kingdom Aram-Damascus in 796 BC, that the Neo-Assyrian Empire's presence in the region became significantly more prominent.[512]

Late Bronze Age to the Punic Wars (c. 1000-264 BC) (New York, NY: Routledge, 1995), 234-236. For the chief importance of this priesthood see: Festus *s.v. Ordo Sacerdotum*. In addition to the Rex Sacrorum, outside of Rome near lake Nemi, the chief priest of Diana was also a 'king' of sorts, known as the Rex Nemorensis, mentioned in: Strabo *Geography* 5.3.12, Ovid *Fasti* 3.271, Suetonius *Life of Caligula* 35, Pausanias *Descriptions of Greece* 2.27.4

[512] Glenn E. Markoe, *Phoenicians*, 40-41.

Some Phoenician cities, particularly in the north like Arwad and Irqata, seem to have initially been rather opposed to Assyrian rule as they allied themselves with the Arameans and openly fought against the Neo-Assyrians.[513] Other Phoenician cities however, like Sidon, Tyre, and Byblos, seem to have put up little no resistance against the Neo-Assyrians, for which they were allowed to remain relatively autonomous and self-governing under this empire.[514] Despite this, by the early 7th century BC we start to see a number of Phoenician revolts against the Neo-Assyrians. The Tyrians, under their king, Luli revolted against the Assyrians in 701 BC[515] and the Sidonians under their king, Abdi-Milkutti led a rebellion from 680 to 677 BC.[516]

It is perhaps from our sources on these events and its aftermath, that we get the most insightful information about the Phoenicians and their political systems at this time. For example, we hear that when Sidon's revolt was squashed in 677 BC, the Neo-Assyrians not only beheaded the city's king, Abdi-Milkutti, but brought back a number of Sidon's 'chief officials' whom they paraded throughout the city of Nineveh during their victory celebrations.[517] This seems to suggest that at the time, the Sidonians were ruled not only by their king, but by a variety of other magistrates who also played a leading role in their city's politics and decision-making. Similarly, in a treaty made between King Esarhaddon of Assyria and King Baal of Tyre around 675 BC which stipulates where the Tyrians were allowed trade and what they were to do if a Tyrian merchant vessel ever gets shipwrecked along the shores of the Neo-Assyrians'

territories, there are noticeable distinctions drawn between the 'ships of Baal' and the ships of 'the people of Tyre.'[518] This seems to suggest that Tyre's king did not hold complete control over the city's trade or naval fleet, but instead shared authority in some sort of broader political system.

One governing body that we frequently hear of and that appears to have shared power with Phoenician kings is a council of elders. This political body appears to be referenced in the abovementioned treaty between King Esarhaddon of Assyria and King Baal of Tyre, as it stipulates that an Assyrian 'royal deputy' was to oversee the running of Tyre, which was apparently done by both "you [King Baal] and the elders of your country."[519] Many scholars believe that this very same council of elders is what is being alluded to in a passage from the book of Isaiah (composed in the 8th century BC)[520] which states Tyre's "merchants were all princes" and their "traders were nobles."[521] Furthermore, in the book of Ezekiel, Tyre is described as being ruled by "princes of the sea."[522] Not only does Tyre appear to have had an oligarchic council of elders, but Byblos as well. This can be inferred from a passage in the book of Ezekiel, which claims that "the elders and wisemen of Byblos"[523] ruled over the city.[524] Many scholars believe that the 'assembly' that appears in the aforementioned Report of Wenamun is

also a reference to this governing body at Byblos.[525] In at least some Phoenician cities, a council of elders can even be dated as far back as the late Bronze Age, as this seems to be strongly implied in the Amarna Letters when "Irqata and its elders" write to the Egyptian Pharoah.[526] Furthermore, it is worth mentioning that a council of elders is reported in the late Bronze Age texts of Ugarit, a city which, although not Phoenician, was inhabited by very closely related Western Semitic peoples.[527] As a whole, the abovementioned evidence has been used by scholars to argue that the governments of Phoenician cities during the Iron Age were, in truth, not monarchies but 'merchant oligarchies.'[528]

The presence of these councils of elders in a variety of Phoenician cities is noteworthy as they appear remarkably similar to the institutions that developed in Greece over the course of the Archaic Period. Perhaps the most obvious example is how in the 8th century BC under Lycurgus, the Spartans founded the Gerousia, a council of elders that would advise their kings on important matters of state and would serve as jurymen during trials.[529] Similarly, in the early 7th century BC, the Athenians created the Areopagus council, a board of former Archons who would advise Athens' leaders in political matters and would serve as judges during important legal proceedings.[530] The Areopagus council, like the Gerousia, is also commonly believed to have originally functioned as a sort of council of elders for Athens' kings.[531] Another, perhaps less

obvious, institution resembling the Phoenicians' council of elders is the Boule of Corinth established in 582 BC. This advisory body mostly consisted of Corinthian aristocrats and only had a total of 80 members,[532] which was evidently narrower than Athens' Boule of 500 members.[533] Moreover, there are instances where ancient authors like Diodorus Siculus refer to this Corinthian council not as a Boule but as a Gerousia,[534] which likewise suggests that it functioned as a sort of council of elders.[535]

While the Greek cities of Corinth, Athens, and Sparta are certainly the main focus of this thesis, it is worth briefly mentioning that similar councils of elders appear elsewhere in the Greek world during the Archaic Period as well. For example, Aristotle claims that a Gerousia existed not only in Sparta, but on Crete and in the city of Elis too.[536] It is also noteworthy that certain political titles in Greek, like that of an ambassador 'πρέσβυς' ultimately derive from the word for an 'old man.'[537] Moreover, it seems likely that the council of elders that is described advising King Priam of Troy in the *Iliad*, would have been a familiar or recognizable institution to much of Homer's 8th century, panhellenic audience.[538] Finally, over the course of the Archaic Period Rome, a city on the periphery of the Greek world, is said to have developed its senate, a governing body which also seems to have functioned as a council of elders, since the word

'senatus' itself is often translated to 'Gerousia' in Greek, and appears to have ultimately derived from the Latin word 'senex' meaning 'elder.'[539]

At this point, I should mention that not all scholars are of the belief that councils of elders first appeared in the Greek world over the course of the Archaic Period. Some have argued that councils of elders were instead established centuries earlier, in the Mycenaean kingdoms of the late Bronze Age, as our surviving Linear B tablets appear to refer to an institution called the *ke-ro-si-ja* (Gerousia?).[540] I, however, disagree with this argument and believe that it can mostly be ignored or treated as negligible. Firstly, it is worth pointing out that out of all of the discovered Linear B tablets, only one of them, known as PY An 261, mentions the *ke-ro-si-ja*.[541] So, we have no indication that this institution was widespread in Greece at the time, only that it existed somewhere in the late Bronze Age kingdom of Pylos. Secondly, it is important to bear in mind that while some scholars have argued (mostly on etymological grounds) that the *ke-ro-si-ja* was some sort of council of elders, others believe that it was nothing more than a guild of local bronzesmiths.[542] As a result, there is no clear-cut scholarly consensus on the meaning of *ke-ro-si-ja* or its function. Even if one were to, for argument's sake, assume that the *ke-ro-si-ja* was some kind of governing body, we still have no indication that this council advised the king (*wanax*). In fact, all of our evidence suggests that the *ke-ro-si-ja* was closely associated with the *qa-si-re-u*, an official of relatively minor importance at this time, who helped govern a village or small

community on the *wanax*'s behalf.[543] Thus, we have no reason to believe that the *ke-ro-si-ja* advised Mycenaean kings (*wanakes)* or that they played a major role in the administration of the kingdoms and palatial economies of late Bronze Age Greece. Because the function of the *ke-ro-si-ja* remains ambiguous and this institution is only mentioned once, in a tablet dating almost two centuries after 'Irqata and its elders' had already written to the Egyptian pharaoh, I believe that it is fair to say that the Phoenicians, in all likelihood, developed their councils of elders several centuries *before* such advisory bodies ever appeared in Greek city-states like Sparta, Athens, and Corinth. From this, perhaps we can assume that the councils of elders that existed in the ancient Greek world were in some ways inspired by these Phoenician precursors or counterparts.

While the Neo-Assyrians appear to have held sway over Phoenicia throughout much of the 8th and 7th centuries BC and provided a number of important written sources on Phoenician political systems at this time, by the early 6th century BC the might of the Neo-Assyrian Empire had waned and given rise to a new power in the region, the Neo-Babylonians. It is somewhat unclear when the Neo-Babylonians began to assert their authority over the Phoenicians. The 1st century Jewish historian Josephus claims that Tyre fell under the hegemony of King Nebuchadnezzar II after a 13 year-long siege against the city, which began in the seventh year of his reign.[544] This would mean that the Neo-Babylonians started besieging Tyre in 598 BC and finally concluded hostilities with the Tyrians in 585 BC. The Book of Ezekiel, on the other hand, claims that the Neo-Babylonian siege of Tyre was foretold in the 11th year of King Zedekiah's reign and was finally concluded in the 27th year after Zedekiah's ascension to the throne.[545] This

[545] Ezekiel 26:1-21, 29:17-20.

would suggest the siege began sometime after 587 BC and ended around 571 BC.[546] In more recent years however, scholars have viewed these dates with increasing scepticism. Scholars have cast doubt on whether the Neo-Babylonians truly besieged Tyre for as long as thirteen years, since our earliest manuscripts of Josephus' *Jewish Antiquities* often state that the siege of Tyre lasted for, instead, only three years and ten months.[547] Moreover, scholars have noted that in the surviving chronicles of the Babylonians themselves, Phoenician cities like Tyre, Sidon, and Arwad are mentioned paying tribute to Nebuchadnezzar II as early as 603 BC.[548] This has led some scholars to suggest that the siege of Tyre, in reality, occurred as early 603 BC.[549]

Although Tyre and the other Phoenician city-states had fallen under the hegemony of the Neo-Babylonians by the early 7th century BC, they appear to have been allowed to maintain a degree of autonomy and self-governance. The Babylonians likely granted the Phoenicians these privileges, not out of compassion or altruism, but for pragmatic reasons as they wanted to stabilize the region and decrease the chances of revolt while they were preoccupied with extensive campaigns in Arabia and in dealing with the growing threat of the Medes to the northeast.[550] Moreover, by leaving the Phoenicians relatively independent, the Neo-Babylonians could reap the benefits of the Phoenicians' flourishing economies and trade networks. Under the reign of King Nebuchadnezzar II (605-562 BC), cedar wood from Phoenicia was used in a number of major building projects, including for the construction of Nebuchadnezzar's own palace in Babylon.[551] The high functionary (*rab tamkari*) in charge of Nebuchadnezzar's palace

merchants, Hanon, also appears to have been of Phoenician origin and shows, one again, just how important the Phoenicians were for the Neo-Babylonians and their economy at this time.[552]

The relative autonomy or independence of Phoenician cities at this time is perhaps best illustrated by the fact that, just ten years after the Neo-Babylonian siege of Tyre, the citizens of Tyre are said to have abolished their monarchy. In its place, they established a new system of government where they would elect a suffete or 'judge' to rule over Tyre for a limited term.[553] This political development in the early 6th century BC is noteworthy as even scholars like Sandro Fillipo Bondi, who is generally rather skeptical of the existence of Phoenician oligarchies in antiquity, concede that this is one clear example of a non-monarchical form of Phoenician government with elected magistracies.[554] Over the subsequent years, similar forms of collective rule appear to have sprouted elsewhere in the Phoenician world as well. A 5th century Phoenician inscription from Sarepta, for example, seems to suggest that the city was ruled by a board of ten councillors.[555]

It is also worth noting that a number of later ancient Greco-Roman sources, produced either during the Classical Period or beyond, portray Phoenician cities as operating under broadly-based forms of rule. For example, in Diodorus Siculus' *Library of History*, Sidon is portrayed as being ruled at least in part, by a group of more than four hundred of the city's aristocrats (ἐπιφανεστάτους τῶν πολιτῶν), who functioned as 'councillors' (σύμβουλοι) and appear to have regularly convened at 'public assemblies' (κοινός σύνοδος).[556] Furthermore,

[556] Diodorus Siculus *Library of History* 16.45.1

Diodorus claims that the people of Sidon, Tyre, and Arwad regularly convened in a 'council' (συνέδριον) at the city of Tripoli to vote and deliberate on important political matters regarding these three respective city-states (from which 'Tripoli' received its name).[557] Our surviving Greco-Roman historians of Alexander the Great and his conquests also seem to portray Phoenician cities as oligarchies. For example, Arrian claims that the inhabitants, not the kings of Phoenician cities like Byblos and Sidon, were the ones who ultimately negotiated their surrender to Alexander.[558] Quintus Curtius Rufus on the other hand, slightly differs in his account as he mentions a king of Sidon, Straton, who was apparently responsible for surrendering his city over to Alexander, albeit claims that this was done "rather at the desire of the people [*popularium*] than of his own accord."[559] Later on, our ancient Greco-Roman historians claim that Alexander was met by delegates sent by the people (τοῦ κοινοῦ) of Tyre, who had decreed in an assembly that their city should negotiate its surrender.[560] These negotiations however, were ultimately unsuccessful, for which Alexander later besieged and destroyed the city.

Finally, our surviving inscriptional evidence from the Greco-Roman period also seems to indicate that Phoenician cities operated under broad-based forms of government. For example, a bilingual Attic inscription from the 3rd century BC claims that the citizens of Sidon had an 'assembly,' which could apparently make important political decisions.[561] Similarly, a Hellenistic inscription from Tyre dating to the 3rd century BC provides both the year of the

contemporary Ptolemaic king's reign and the year of the reign of the 'people of Tyre' as a whole.[562] While it is certainly noteworthy that various ancient Greco-Roman sources portray Phoenician cities in this way, it is also important to bear in mind that these works were produced, for the most part, long after the Archaic Period. As a result, even though these sources may reflect, to some degree, the political institutions that we hear of already in the Archaic Period, they also likely reflect developments in Phoenician political systems or constitutions that occurred sometime between the late Archaic Period and when these sources were produced. Therefore, it is unfair to assume that after the Archaic Period, Phoenician governments remained relatively unchanged or stagnant in their development and to treat these later Greco-Roman sources without any caution or scrutiny.

Not only do the Phoenician cities of the ancient Near East appear to have developed broader, non-monarchical forms of government over the course of the Archaic Period, but the Phoenician colonies of the western Mediterranean appear to have done so as well. The best example of this is, of course, Carthage, a city that was ruled by two suffetes who, although often called 'basileis' in Greek,[563] were elected officials appointed annually by Carthage's citizens and,[564] according to Aristotle, were usually selected on the basis of their wealth and merit.[565] These two suffetes appear to have been primarily in charge of managing local civic affairs and were not permitted to lead Carthage's military as this was a responsibility that was instead,

allotted to Carthage's generals, another annually elected position.[566] In addition to these offices, we hear that Carthage had a council of around one hundred magistrates who served as the city's judges during important legal proceedings.[567] We also hear of a Carthaginian 'senate' or 'council of elders' (*senatus*/γερουσία) that advised the suffetes on important matters of state and would conduct diplomacy with foreign powers.[568] Lastly, we hear that Carthage had a citizen assembly that held considerable power over the city's political decision-making,[569] even more than the assemblies in contemporary Greek city-states did.[570] For these reasons, Aristotle calls Carthage a 'democracy' (δημοκρατουμένῃ),[571] Eratosthenes lauds the Carthaginian political system for being 'marvelous'(θαυμαστῶς) and 'civilized' (ἀστείους),[572] Polybius claims that the masses (τὸ πλῆθος) possessed supreme authority in Carthage,[573] and a number of other ancient authors compare Carthage's constitution to contemporary Greco-Roman ones, particularly the diarchic systems of Sparta and Rome.[574]

In addition to Carthage, various other Phoenician colonies in the western Mediterranean seem to have also developed broader, non-monarchical forms of government over time. The Roman historian Livy, for example, tells us that during the Second Punic War (218-201 BC), the Phoenician city of Gades (modern-day Cadiz, Spain), like Carthage, relied on a system of

government ruled by two suffetes.[575] Similarly, a 2nd century BC inscription from Roman Sardinia claims there were two annually elected suffetes ruling there as well, a likely remnant of a Phoenician political system that existed prior to Rome's invasion of the island in the 3rd century BC.[576] Outside of Spain and Sardinia, archaeologists have discovered a number of inscriptions ranging from the 2nd century BC to the reign of Roman Emperor Commodus (177-192 AD), which, likewise, suggest that the chief magistrate in more than 40 Punic cities in North Africa as well at Eryx on the island of Sicily, continued to go by the title of 'suffete' throughout this period.[577] From these inscriptions, perhaps we can conclude that the Phoenician cities of the western Mediterranean, for the most part, operated under oligarchical political systems in antiquity, headed by their two annually elected 'judges.'

While it is known that Carthage and other Phoenician colonies in the western Mediterranean eventually developed broader, non-monarchical forms of government, it is somewhat unclear when these political systems were first introduced. A number of Greco-Roman authors recount the story of the legendary Queen Dido (also known as Elissa), who was supposedly driven from her hometown of Tyre by her tyrannical brother Pygmalion and, after wandering throughout the Mediterranean, eventually founded the city of Carthage to become its first monarch.[578] However, even if one were to, for argument's sake, believe everything our ancient sources say about Dido, then one could still question whether these legends truly portray early Carthage as a sort of monarchy. This is because, our most detailed account of Dido's life, Justin's *Epitome of Pompeius Trogus' Philippic Histories,* claims that she founded Carthage

[575] Livy *Ab Urbe Condita* 28.37.2

[578] Strabo *Geography* 17.3.15, Virgil *Aeneid* 1.335-370, Ovid *Metamorphoses* 14.75-81, *Heroides* 7, Tacitus *Annals* 16.1, Appian *Punic Wars* 1.1.

along with a number of Tyre's leading men (*principibus in societatem*) and senators (*senatorum*).[579] Later on, when the Numidian king, Iarbas asks for Dido's hand in marriage, it is not the queen herself who negotiates with this foreign ruler, but a board of ten Carthaginian councillors.[580] When these 'legates' (*legati*) return from their diplomatic mission, they are described initially being rather hesitant to tell Dido the truth of what Iarbas requested. However, after Dido demanded that all Carthaginians must do whatever they can for their newly founded city, these magistrates eventually reveal the truth. Upon realizing that she, in accordance with her own advice, must now marry Iarbas, Dido decides to construct a funeral pyre and kill herself upon it, choosing to honour her dead husband Acerbas over remarrying (unlike in Virgil's more famous account of Dido's death, where she commits suicide after her failed love affair with Aeneas).[581] Thus, it seems that our ancient Greco-Roman sources, in truth, portray early Carthage as a sort of oligarchy, ruled by the city's queen in conjunction with a senate and a number of other magistrates (perhaps not too dissimilar from the political system of archaic Sparta). Moreover, our ancient sources claim that Dido died childless and do not mention anybody succeeding her as Carthage's monarch.[582] As a result, if one were to believe our ancient Greco-Roman sources and what they say about early Carthage, then it seems that the city was ruled by a monarchy for, at best, one generation and even then, the queen's powers were circumscribed by various other officials.

---

[579] Justin *Epitome of Pompeius Trogus' Philippic Histories* 18.4.9-15. See also: Virgil *Aeneid* 1.426, 4.682 and Cato the Elder as quoted in Servius *Commentary on the Aeneid* 4.682.
[580] Justin *Epitome of Pompeius Trogus' Philippic Histories* 18.6.1.
[581] Justin *Epitome of Pompeius Trogus' Philippic Histories* 18.6.5-7. Our earliest account of Dido, written by Timaeus of Tauromenion (*BNJ* 566 F82) also claims that she dies in this way, after being pressured by her fellow citizens to marry Iarbas. For Virgil's account of Dido's death see: *Aeneid* 4.642-666.
[582] Virgil *Aeneid* 4.31, 4.329 implies that Dido died childless and Ovid *Fastii* 3.523-710 claims that Anna (Dido's sister) fled Carthage soon after her death and did not become queen.

With that said, in practice, one should treat the story of Dido with great caution in terms of its historical value. She is not mentioned in a single Carthaginian source and the earliest known reference to Dido was written by the Greek historian, Timaeus of Tauromenion around 300 BC, more than five centuries after the city of Carthage was founded.[583] Therefore, our earliest sources for this monarch were written very late, even later than say Aristotle's *Politics,* where Carthage is clearly described as an oligarchy and is said to have never been ruled by a tyrant or to have suffered from any major political upheavals.[584] Some scholars have suggested that instead of having monarchies, Phoenician colonies in the western Mediterranean were ruled from the very beginning by a collection of aristocratic families who had taken part in the city's foundation.[585] If this is true, then it would mean that the Phoenicians of the western Mediterranean developed broader, non-monarchical forms of government even before the ancient Greeks did, as Carthage is typically thought to have been founded around the late 9th century BC,[586] whereas the city-states of Greece, such as Corinth and Athens, seem to have abolished their monarchies in the mid 8th to early 7th centuries BC.[587]

Other scholars have suggested that at first, Phoenician colonies like Carthage were ruled by a governor who acted on behalf of the king of Tyre (i.e. its parent city).[588] This may be evidenced by an 8th century BC inscription from Cyprus, which claims that the Tyrian colony of Kition was ruled by a certain 'governor' who represented the contemporary Tyrian king, Hiram

[587] As previously mentioned, some scholars have alternatively dated the abolishment of Athens' monarchy to slightly earlier, in the 8th century BC, such as: Dexter Hoyos, *Carthage: A Biography,* 32. Ron Owens, *Solon of Athens: Poet, Philosopher, Soldier, Statesman* 39-40. J. B. Bury, *A History of Greece,* 170. Jonathan M. Hall, *A History of the Archaic Greek World, Ca. 1200-479 BCE*, 135.
[588] Glenn E. Markoe *Phoenicians*, 89.

II.[589] Moreover, we hear that around 708 BC, Tyre led an expedition against Kition because the city had apparently stopped paying its regular tribute and revolted.[590] Perhaps Carthage, like Kition, was also initially under the suzerainty of Tyre, but over time as the Tyrians became increasingly occupied in dealing with Neo-Assyrians and Babylonians at home, their grip over the city was loosened and Carthage's leaders began to represent, more and more, the interests of the local inhabitants. For the proponents of this theory, Carthage's system of government ruled by its two annually elected suffetes should not be dated much before the 6th century BC.[591]

Regardless of which theory is true, it seems fair to say that by the 6th century BC, Carthage had already developed its oligarchy. The earliest Carthaginian political figure that our ancient Greco-Roman sources mention, apart from Dido, is Malchus, a general (*imperator*) who had apparently earned a name for himself by leading several successful campaigns in Sicily and Libya during the mid 6th century BC.[592] After experiencing mixed success in his expeditions on the island of Sardinia, however, Malchus is said to have been exiled by the people of Carthage. In response to this, Malchus led his army against Carthage and besieged the city. Upon capturing it, Malchus is said to have executed ten of the 'senators' (*senatoribus*) who had contributed the most to his banishment and gave pardon to those who requested clemency during an assembly of Carthage's citizens. Malchus then left the city to be governed in its usual way, but soon afterwards, was tried and executed by his political opponents on the grounds that he was aspiring to make himself king (*rex*).[593]

The story of Malchus seems to clearly suggest that at this time, Carthage did not have a monarchy but was ruled by a much broader, non-monarchical form of government. Furthermore, scholars believe that the story of Malchus, unlike Dido, holds a degree of historical truth to it.[594] This is because, it appears that it was indeed during the mid 6th century BC that Carthage began to expand its sphere of influence to include larger portions of North Africa as well as the Mediterranean islands of Sicily and Sardinia. Herodotus, for example, tells us that around 540 BC, the Carthaginians fought a naval battle against the Phocaeans in the 'Sardinian Sea' (τὸ Σαρδόνιον καλεόμενον πέλαγος) in order to prevent these Greek settlers from founding a colony on the nearby island of Corsica.[595] Similarly, from a treaty signed between Carthage and the Roman Republic in 509 BC, we get the impression that by this time, the regions of Sardinia, western Sicily, and Cape Bon, were firmly under Carthaginian hegemony.[596] The expansion of Carthage's influence in the western Mediterranean during the mid 6th century BC seems to be further corroborated by archaeological evidence. At this time, the Phoenician strongholds at Monte Sirai and Cuccurredus appear to have been violently destroyed along with the Nuragic settlement at Su Nuraxi, which suggests that there were growing conflicts between the native Sardinian and Punic peoples.[597] Moreover, the increasing prevalence of Carthaginian pottery and funerary practices on Sardinia in the mid 6th century BC seems to coincide with Carthage's imperialistic efforts in the region.[598] It may also be worth pointing out that in the first half of the 6th century BC, more than 50% of Carthage's food appears to have been imported from overseas.

From the mid 6th century BC onwards, however, our archaeological evidence suggests almost all of Carthage's food was produced locally in North Africa.[599] Having said that, it is important to bear in mind that this piece of evidence does not necessarily prove by default that at this time, Carthage acquired more land in North Africa through military action as it could also be an indication of new treaties or alliances between Carthage and the neighbouring Libyan kingdoms.

Even if one were to doubt the historical reliability of Malchus, then it, nevertheless, seems fair to say that Carthage had developed its oligarchy by the 6th century BC. The Carthaginian ruler Hasdrubal I, who was active from around 530-510 BC, is said to have held the office of 'dictator' eleven times throughout his reign, which seems to be a clear indication that he was not a king, but an elected official of some sort.[600] Likewise, when Herodotus claims that the Magonid ruler, Hamilcar I (510-480 BC), was made king (βασιλεύσαντά) of the Carthaginians on account of his manly virtue (κατ᾽ ἀνδραγαθίην),[601] he does not seem to be implying that Hamilcar I was a dynastic monarch who inherited his position,[602] but rather some sort of elected military leader.[603] For these reasons, Diodorus Siculus calls Hamilcar I a 'general' (στρατηγός) who was elected (προκρίναντες) by the Carthaginians because he was held in very high esteem (τὸν μάλιστα θαυμαζόμενον) amongst them.[604] Finally, on an inscription from Carthage itself dating to the late 6th century BC, there are 'suffetes' mentioned ruling over the city.[605] The inscription may even provide a date for how long the Carthaginians had been ruled by their

elected suffetes at this point, one hundred and twenty years, which if true, suggests that the city developed its oligarchy sometime around the second half of the 7th century BC. With that said, because this inscription is highly fragmentary and poorly preserved, there are debates over this date and some scholars tend to prefer an interpretation where the inscription does not tell us at all about when this political system began.[606]

If Carthage did indeed develop a non-monarchical form of rule prior to the 6th century BC, then this would mean its – to use Aristotle's classification – 'democratic' government was established even before Athens' was in 508 BC.[607] It would also mean that Carthage's political system predates the Roman Republic (founded in 509 BC) and our earliest evidence of a democratic government on the Greek island of Chios (the so-called constitution of Chios, dated to 575-550 BC). Even though Corinth is said to have abolished its monarchy in the mid 8th century BC, we have already seen that its early oligarchy was incredibly narrow and remained in the hands of only the limited few who belonged to Corinth's former royal family, the Bacchiadae. For these reasons, a number of ancient literary sources treat the Bacchiad oligarchs of Corinth as though they, in truth, were not all that different from the hereditary monarchs who ruled beforehand.[608] As a result, even if one were to, for argument's sake, assume that Carthage initially operated under a monarchy, ruled by kings in conjunction with the city's council of elders and other magistrates until the 6th century BC, then one could still question whether this

system of government was truly narrower or more restrictive than the early oligarchies of contemporary Greece.[609]

Moreover, as previously mentioned, the Bacchiad oligarchy of Corinth lasted for less than a century before it was overthrown and replaced by yet another monarchy, this time under the leadership of the Cypselid tyrants. It was only in 582 BC, after overthrowing their tyrant, Psammatichus, that the Corinthians truly established a much broader, more collective system of rule where all adult male citizens were, at least in theory, permitted to take part in government.[610] Thus, it seems that Corinth too only established a much broader, non-monarchical system of government *after* Carthage had already done so (at some point prior to the 6th century BC). The overthrow of Corinth's tyranny in 582 BC, the composition of the constitution of Chios around 575-550 BC, and the creation of the Solonian reforms that broadened Athens' oligarchy in 594/3 BC, would have all occurred *after* Carthage had already developed its political system and at around the same time that Tyre was establishing its oligarchy ruled by its elected suffetes, just ten years after the Neo-Babylonian king, Nebuchadnezzar II's invasion of Phoenicia. The creation of the Peloponnesian League and the trend throughout Greece of abolishing tyrannies and replacing them with oligarchies (typically pro-Spartan ones) would have all occurred *after* non-monarchical systems of rule had already been established both in the Phoenician colonies of the western Mediterranean and in Tyre.

In sum, the Phoenicians, like the ancient Greeks, appear to have gradually reduced the powers of their kings and replaced them with broader oligarchical governments. However, unlike the Greeks, the Phoenicians appear to have begun this process long before the Archaic Period.

---

[609] For more information on early Greek oligarchies and their resemblance to narrow authoritarian regimes, see: Matthew Simonton, *Classical Greek Oligarchy: A Political History*, 71-73.
[610] Nicolaus of Damascus *BNJ* 90 F 60.

Our first indication that some Phoenician cities began developing broader, more collective political systems comes from the Amarna Letters of the late Bronze Age. As we have seen, a number of documents from the Iron Age show that this trend appears to have continued in Phoenician cities during this period as well until the end of the Archaic Period. Thus, the trend of adopting broader oligarchical governments appears to have begun several centuries *earlier* in Phoenicia than in Greece and eventually ran concurrently with the events of the Archaic Period. Moreover, this chapter has shown that many of the oligarchical institutions that existed in Phoenician cities, such as their councils of elders and the priestly role of their kings, are remarkably similar to what we can see in archaic Greece. From this, I would argue that it is quite possible that the political developments of archaic Greece were in some ways inspired by these various Phoenician precursors or counterparts.

Chapter 8
Conclusion

In conclusion, the Archaic Period (800-480 BC) was, without a doubt, an important era in the history of ancient Greece, where Greek society underwent a number of major changes or advancements. This period saw an increased wave of urbanization in Greece, the reemergence of literacy and long-distance trade, the development of various new art forms, and above all, an abandonment of the traditional monarchies that had been ruling over the region from time immemorial, in favour of newer, more collective political systems. As this thesis has clearly shown, at the dawn of the Archaic Period, most Greek city-states were ruled by narrow, monarchical regimes headed by a local chieftain or 'basileus,' whose dynasty claimed descent from a legendary hero of the distant mythical past (Chapter 3). As the Archaic Period progressed, however, these city-states seem to have gradually reduced the powers of their kings and, in many instances, outright abolished their monarchies in favour of broader oligarchical governments, where power could be more evenly distributed. This trend of establishing broader, more collective forms of rule over the course of the Archaic Period can perhaps best be seen in the histories of Corinth (Chapter 4), Sparta (Chapter 5), and Athens (Chapter 6) as these three city-states each appear to have undergone a series of constitutional reforms that left them, more or less, under oligarchical political systems by the end of this era.

The political developments of the Archaic Period remain to this day a popular topic in scholarship and political discourse as the governments of the ancient Greeks are routinely viewed as the direct precursors to modern western democracies. Books written on the history of democracy often begin by discussing the ancient Greeks and their political developments over

the course of the Archaic Period, especially the reforms of Cleisthenes in 508 BC.[611] Likewise, a number of contemporary world leaders and politicians continue to reference the ancient Greeks and their political institutions, when delivering speeches on the nature or origins of democracy.[612] While the history of the ancient Greeks and the abolishment of their monarchies in favour of broader, more collective systems of government is a much-discussed topic in modern scholarship and political discourse, researchers rarely contemplate whether the Greeks were truly unique in this regard or if other civilizations in antiquity were also developing oligarchies at around this time. These Hellenocentric oversights are unfortunate as it seems that, in truth, the ancient Greeks were not alone or exceptional in the way they organized their city-states.

My research here has attempted to amend some of these oversights in modern scholarship and demonstrate that instead of myopically focussing on the ancient Greeks and their political developments in isolation – as though this civilization existed in a vacuum – it is far more fruitful to study them in their appropriate context and in conjunction with the other civilizations of the ancient Mediterranean. I have achieved this, in large part, by exhibiting that the Phoenicians were another people in antiquity who, like the Greeks, developed broad-based oligarchical forms of government over time (Chapter 7). From as early as the 14th century BC, we have evidence to suggest that Phoenician kings did not hold complete authority over their cities, but shared power with other governing bodies or officials. From the early Iron Age onwards, we have a number of sources written either by the Phoenicians themselves or their neighbours (the Egyptians, Assyrians, Babylonians, Israelites, etc.) which suggest that the Phoenicians continued limiting the powers of their kings throughout this period and to operate

[611] For examples, see: Luciano Canfora, *Democracy in Europe: A History of an Ideology*. Kurt A. Raaflaub, Josiah Ober, and Robert Wallace, eds., *Origins of Democracy in Ancient Greece*. Jim Miller, *Can Democracy Work?: A Short History of a Radical Idea, from Ancient Athens to Our World*.

under broader, more collective systems of government. By the 5th century BC, several Phoenician cities in the Levant, such as Tyre and Sarepta, appear to have even abolished their monarchies in favour of governments ruled by elected magistrates who served for limited terms.

Of course, it was not only in the Levant that the Phoenicians developed broader, non-monarchical forms of government, but in the western Mediterranean as well. Some scholars have suggested that instead of having monarchies, the Phoenician colonies of the western Mediterranean were ruled from the very beginning by a collection of aristocratic families who had taken part in the city's foundation.[613] If this is true, then it would mean that the Phoenicians of the western Mediterranean developed broad non-monarchical forms of government even before the ancient Greeks did, as Phoenician colonies like Carthage are typically thought to have been founded in the late 9th century BC,[614] whereas the city-states of Greece, such as Corinth and Athens, appear to have abolished their monarchies around the mid 8th to early 7th centuries BC.[615] With that said, it is important to bear in mind that other scholars have argued that the Phoenician colonies of the western Mediterranean were initially ruled by 'governors' who acted on behalf of the king of Tyre and his interests.[616] For the proponents of this theory, it was only shortly before the 6th century BC that these political systems were eventually abandoned in favour of broader oligarchies, led by locally elected rulers.

Regardless of which theory is true, it seems fair to say, based on our surviving evidence, that by the dawn of the 6th century BC, Carthage along with a number of other Punic cities in the

[614] Dexter Hoyos, *Carthage: A Biography,* 2-3.
[615] As previously mentioned, some scholars have alternatively dated the abolishment of Athens' monarchy to slightly earlier, in the 8th century BC, such as: Dexter Hoyos, *Carthage: A Biography,* 32. Ron Owens, *Solon of Athens: Poet, Philosopher, Soldier, Statesman* 39-40. J. B. Bury, *A History of Greece,* 170. Jonathan M. Hall, *A History of the Archaic Greek World, Ca. 1200-479 BCE*, 135.
[616] Glenn E. Markoe *Phoenicians*, 89.

western Mediterranean, had likely developed broad non-monarchical forms of government.[617] These political systems were led by two annually elected suffetes or 'judges' as well as a number of other officials, governing bodies, and councils. Our surviving sources on the history of Carthage, for example, often praise the Carthaginian political system for the rights it provided to citizens and the many striking similarities it had to the contemporary governments of the ancient Greeks and Romans.[618] In fact, Aristotle even went so far as to call Carthage's government a 'democracy' (δημοκρατουμένῃ).[619]

Not only do our various ancient sources on the history of the Phoenicians suggest that their cities operated under broad-based – potentially even 'democratic' – forms of government, but in recent years, modern scholars have been coming to rather similar conclusions.[620] For example, in his 2010 article "Before Athens: Early Popular Government in Phoenician and Greek City-States," Stephen Stockwell boldly declared:

> It is clear from this historic arc that the Phoenician cities commenced as strong monarchies and ended with relatively weak kings. It is also clear that all along the way, from the fifteenth century BC to the fourth, the leaders were advised by councils or assemblies which gradually took greater power. There are questions as to how broadly those institutions represented the populace and how free and unconstrained their deliberations were but on the balance, it may be concluded that the active role that the assembly took on the few occasions we see it in operation suggests that the Phoenicians had something more than an autocracy or even oligarchy and that it earns categorization as a proto-democracy, at least, if not full recognition as a democracy.[621]

With that said, other scholars have preferred a more reserved approach than Stockwell and have decided, instead, to classify the political systems of the ancient Phoenicians as 'merchant

[621] Stephen Stockwell, "Before Athens: Early Popular Government in Phoenician and Greek City States," 129.

oligarchies.'[622] In this thesis, I have perhaps taken 'the middle-road' between these two arguments. On the one hand, I agree with scholars like Maria Aubet, who suggest that Phoenician cities operated, by and large, under oligarchical political systems in antiquity. On the other hand, however, I agree with Stockwell's assertion that we might even classify Phoenician governments as 'democracies' or at the very least, 'proto-democracies' in so far as we recognize that in antiquity, Greek 'democracies' (Athens, Chios, etc.) were really rather oligarchical in nature.

As I have clearly shown (in Chapter 6), by the late Archaic Period, Athens' 'democracy' resembled more of an oligarchical political system, than anything. Around 90% of Athens' population would have been excluded from politics as women, children, slaves, and resident foreigners were all strictly prohibited from voting and holding offices.[623] Out of the 30,000 to 50,000 property-owning adult men who did, in fact, qualify for Athenian citizenship, only around 6,000 of them, at any given point, could have feasibly attended the city's assembly meetings on the Pnyx and taken part in their government's decision-making.[624] Moreover, under Athens' new 'democracy' the same aristocratic families that had been dominating the city's politics for centuries, such as the Philaids and Alcmaeonidae, would continue to hold the highest positions of power and to rule over the city. Although the word 'democracy' (δημοκρατία) itself implies that this was a system where the masses (*demos*) held supreme authority (κράτος) over political matters, the use of this term in reference to the government established by Cleisthenes in 508 BC appears to be a euphemism or misnomer. In truth, it was only after the Archaic Period, in the second half of the 5th century BC, that Athens' government became increasingly 'democratic'

in nature as the property requirements to run for the archonship were lowered, the Areopagus council's powers were reduced, and citizens were granted the right to receive daily wages for serving as jurors.[625] Even then, some scholars have preferred to suggest that during the Classical Period, oligarchies and democracies were, for the most part, indistinguishable from one another and were far more similar than our ancient sources indicate.[626]

Having said all that, if scholars have no qualms about calling Athens' political system by the late 6th century BC a 'democracy,' then I see no reason why they should hesitate to use the same terminology when describing the governments of contemporary Phoenician city-states. If, however, we acknowledge that ancient Greek democracies were really not so 'democratic' in practice, then perhaps we should refrain from using the term 'democracy' altogether and strictly limit ourselves to 'oligarchy,' when describing the political institutions of the ancient Greeks and Phoenicians (especially during the Archaic Period). Whichever side of this argument one takes could have larger ramifications over what kinds of conclusions, one can draw from the evidence. If we, like Aristotle and Stephen Stockwell, are able to call the political systems of the ancient Phoenicians 'democracies' and can recognize that such systems were established in Punic cities already by the start of the 6th century BC, then this would lead us to conclude that the Phoenicians invented 'democracy' before the Athenians (508 BC), Chians (575-550 BC?) or any other Greeks had ever done so. If we, however, wish to refrain from using this sort of terminology, then we, at the very least, can say that the Phoenicians began the process of broadening their governments several centuries before the Greeks (starting as early as the 14th century BC). We can also say that the broad-based, non-monarchical forms of government that

[626] Hartmut Leppin, "Unlike(ly) Twins? Democracy and Oligarchy in Context," in *A Companion to Ancient Greek Government*, ed. Hans Beck (London, England: Wiley-Blackwell, 2013),146-147. Paul Cartledge, *Democracy: A Life,* (New York, NY: Oxford University Press, 2016), 1-2, 8.

existed in Phoenician cities like Carthage, appear to have been established before the Greeks made significant strides in broadening their oligarchies (e.g. the Solonian reforms of 594/3 BC, Corinth's political reforms of 582 BC, etc.) and in getting rid of the various monarchical governments or tyrannies that prevailed throughout the region (which were, for the most part, overthrown by the Spartans in the latter half of the 6th century BC).

Of course, my research has not only shown that the Phoenicians began the process of developing broader, more collective systems of government *before* the ancient Greeks did, but that the Phoenicians and Greeks shared a number of remarkable similarities in the ways their societies were organized. Both the Phoenicians and Greeks were divided into a number of city-states in antiquity. These cities often began as monarchies, but over the course of the early Iron Age, increasingly circumscribed the powers of their kings. One way this was achieved was by establishing a senate or 'council of elders' to advise the king on important political matters and to serve as judges during legal proceedings. Another way this was achieved was by relegating the 'king' (whether *mlk* or *basileus*) to a primarily religious and symbolic role in society, while distributing his former duties to various other magistracies. When considering these close similarities between the political systems of the ancient Greeks and Phoenicians in combination with the fact that our evidence suggests the Phoenicians established broader oligarchical forms of government *before* the Greeks did, it seems likely that the Phoenicians and their oligarchies had at least some influence over the political developments of archaic Greece.[627] This seems even more likely when one considers the close contact the Greeks and Phoenicians had with one another throughout the Archaic Period and the numerous innovations the Greeks are known to

[627] As scholars have been increasingly arguing in recent years, such as: Simon Hornblower, "Creation and Development of Democratic Institutions in Ancient Greece," 2. Stephen Stockwell, "Before Athens: Early Popular Government in Phoenician and Greek City States," 129. Robert Drews, "Phoenicians, Carthage, and the Spartan Eunomia," 57-58.

have adopted from the Phoenicians at this time (such as their written script, shipbuilding techniques, pottery styles, and more). Thus, my thesis has mainly argued that as the Archaic Period progressed and the Greeks started to experience growing social unrest in their cities, they quite possibly turned to the Phoenicians and their political institutions for inspiration on how to solve this infighting and establish broader, more collective systems of rule that could appease the demands of their cities' citizens.

While my research has shown that the Phoenicians started developing broader forms of government several centuries before the ancient Greeks and that there were a number of similarities between these two peoples' political systems in antiquity, I have not, unfortunately, provided direct evidence of the Greeks receiving inspiration from the Phoenicians and their oligarchies. I have not quoted from any source, whether Greek or Phoenician, that overtly claims the political developments of archaic Greece were inspired by the contemporary city-states of Phoenicia. Nevertheless, I hope I have shown that, in many ways, this lack of a 'smoking gun' from our surviving literary sources, is not surprising. The Greeks of the early Classical Period (from whom we get most of our information about the political developments of archaic Greece) appear to have had, at best, only a vague or obscure understanding of their cities' histories. These ancient authors often provided semi-legendary accounts of Greece's early history that were quite oversimplified, attributing almost all of a city's political institutions to the deeds of a single famous lawgiver, like Lycurgus of Sparta or King Theseus of Athens. When compared to the archaeological record, these accounts often run into serious issues or are disproven entirely. Therefore, if our ancient sources had this tendency of glossing over important historical events and misattributing various laws or institutions to semi-legendary figures, then I see no reason

why it would be hard to believe that in doing so, these authors failed to mention the role of the Phoenicians and their governments over this period's political history.

Be that as it may, even without a direct reference to the influence of the Phoenicians over the Greeks' political developments during the Archaic Period, one could still argue that the origins of broad-based non-monarchical forms of government ultimately lie in Phoenicia. This is because one of the major driving forces behind the political developments of the Archaic Period, as my thesis has clearly shown, were growing social conflicts between a polis' traditional aristocracy and the *nouveaux riches* who were emerging from its merchant class.[628] We have already seen this phenomenon, for example, in Corinth, where the tyrannies of the Cypselids appears to have received strong support especially from the city's wealthy traders who had grown dissatisfied with their marginal role in politics under the previous Bacchiad oligarchy.[629] Similarly, we have seen that in early 6th century Athens, the Solonian reforms attempted to shift the city's oligarchy away from a system that prioritized the status of one's birth (i.e. the members of the Eupatridae) towards a timocracy or system where wealth was what ultimately determined one's political rights and social standing.[630] Later on, Athens' *nouveaux riches* seem to have earned an even greater degree of political autonomy as they backed the tyrannies of the Peisistratids, who in return, appear to have pursued a number of commercial policies that benefited their mercantile supporters. This phenomenon appears to have occurred not only in the oligarchies of ancient Greece but of the Phoenicians as well. When the Book of Isaiah declares that Tyre's "merchants were princes,"[631] when our other ancient sources mention the

Phoenicians' governing bodies deliberating especially over matters of trade,[632] and when modern scholars call the Phoenicians' governments 'merchant oligarchies,'[633] the implication seems to be that the movement towards broader, more collective systems of government arose particularly from Phoenicia's merchant class. Stephen Stockwell perhaps summarizes it best, when he claims that "as trade increased [among the Phoenicians], the power of the king became constrained by the wealth of merchant families keen to influence public affairs."[634]

The reason why the merchant class and their role in broadening the governments of ancient city-states is so significant, is because the Phoenicians can, in many ways, be seen as the cause of this emerging merchant class in archaic Greece. As the famous Roman orator, Cicero once said, "the Phoenicians were the first, through their trading and merchandise, to import into Greece greed and grandiosity and the insatiable desire for all things."[635] This statement appears to be corroborated by our archaeological evidence, which suggests that the Phoenicians played a crucial role in reestablishing trade between the Aegean and broader Mediterranean throughout the so-called Greek Dark Ages.[636] From as early as the 10th century BC, Phoenician merchants appear to have travelled to the Aegean and traded various goods with the Hellenes both on the Greek mainland and on numerous islands. Furthermore, in some locations such as Crete, Cos, and Rhodes, Phoenician merchants appear to have resided permanently, where they played a key role in developing these regions' commercial industries. Some of the Greeks earliest colonial efforts, such as the founding of Ischia just off the coast of Italy in the late 8th century BC, seem

to have been accomplished with the help of a number of Phoenician colonists.[637] The Greeks' ability to engage in maritime trade throughout the Archaic Period was likely only further facilitated by their adoption of Phoenician shipbuilding and navigation techniques, weights and measures,[638] as well as the Phoenicians' written script, which appears to have been first used by the Greeks to record commercial activity.[639] The major role the Phoenicians played in developing Greek trade and in reconnecting the Aegean with the broader Mediterranean over the course of the early Iron Age, is a topic that has been covered thoroughly by many scholars in recent years,[640] but perhaps Carolina López-Ruiz summarizes it best, when she writes:

> As the Iron Age progressed, especially during the eighth century, a burst of economic dynamism produced a global transformation, with the effect of setting the central and western Mediterranean into direct contact with the Levant. Access to cultural assets as well as new markets, with their opportunities and risks, was now in the grasp of local kings, artisans, merchants, farmers, sailors, and soldiers. New forms of writing facilitated a growing dynamic merchant class. Fast, high-capacity sailing boats transported not just goods but people and new cultural models. And at the helms of those boats were, above all, Phoenician mariners, settlers, traders, and explorers… it was these Phoenicians who set in motion the new connectivity networks and to a great degree created a first, truly interconnected Mediterranean.[641]

In sum, even without a 'smoking gun' from our surviving ancient literary sources, one could still argue that the Phoenicians were ultimately the cause of the political developments of archaic Greece, in so far as one recognizes that these political developments were often instigated by the disgruntled local merchant class and that the Phoenicians played a critical role in developing trade and the rise of this merchant class in Greece over the course of the early Iron

Age. By reconnecting the Aegean to the wider Mediterranean and engaging in extensive trade with the Greeks, the Phoenicians quite possibly gave rise to the social tensions in Greek cities that led its inhabitants to turn to outsiders and their systems of government for inspiration, in the first place. Therefore, the fact that the Phoenicians began developing broader political systems *before* the Greeks, the fact that the Phoenicians and Greeks shared a number of remarkable similarities in the ways their city-states were organized, and the fact that the Phoenicians extensively traded and communicated with the Greeks throughout the early Iron Age, can in and of itself, be seen as enough evidence to conclude that the Phoenicians were one of the major causes behind the political developments of archaic Greece. The purpose of this thesis has not been to lessen or discredit the Greeks' role in developing democracy, but rather to demonstrate that the history of broad-based governments is far older and more complicated than is generally assumed. With my research now complete, perhaps we can say that significant strides have been made in determining the Phoenicians' influence over the ancient Greeks and their political institutions, an area of research where Simon Hornblower once said, "scientific study… has hardly begun."[642]

SARAH P. MORRIS - JOHN K. PAPADOPOULOS

Phoenicians and the Corinthian Pottery Industry

»The success of this colonial venture and of wider trading in the west was one of the factors which transformed Corinth in a short space of time from a not very significant city to the leading state in Greece and the first to develop its trade and industries on a large scale. For over a century Corinth controlled the whole colonial area economically, and in that time the colonies made Corinth what she was.«[1]

In this passage from "The Western Greeks", Dunbabin points to a paradox: how Corinth, a small and relatively undistinguished settlement in the Early Iron Age,[2] rose to become not only a leading city - "wealthy Corinth"[3] - but one of the few settlements in Greece to enjoy such prominent archaeological visibility in the seventh century B.C.[4] Dunbabin's reasons for this prominence lacked a certain specificity, as they applied to many other Greek states. The Corinthians were not the only Greeks to enjoy success in their colonial ventures and wider trading activities in the west, nor were they the first. The "first" western Greeks - the Euboians, as it is often insisted[5] - did not develop

---

[1] We are grateful to Kees Neeft for receptively listening to an earlier, oral presentation of the ideas presented here and for urging us to publish it. We are also grateful to Nancy Bookides for expediting the photographs presented in this paper and to the editors of this volume for their initial invitation for us to contribute. In preparing this paper we acknowledge - like all students of the Early Iron Age Mediterranean - our enormous debt to Hans Georg Niemeyer on matters Phoenician.

T.J. DUNBABIN, The Western Greeks: The History of Sicily and South Italy from the Foundation of the Greek Colonies to 480 B.C. (1948) 18, with reference to H. PAYNE, Perachora I (1933) 33 f. For a more recent overview of Greek trade see G. KOPCKE, ArchHom M (1990) 100 ff.

[2] For Corinth in the Early Iron Age see, in particular, S.S. WEINBERG, Corinth VII: 1. The Geometric and Orientalizing Pottery (1943); ID., Hesperia 6, 1937, 487 ff; ID., AJA 45, 1941, 30 ff. For further references see C.A. PFAFF, Hesperia 57, 1988, 21 ff. J.B. SALMON, Wealthy Corinth: A History of the City to 338 B.C. (1984) 38-54.

[3] Cf. ibid.

[4] Witness the discussion concerning Athens and Attika in, for example, R.G. OSBORNE, BSA 84, 1989, 297 ff; ID. in: S.E. Alcock - R. Osborne (eds.), Placing the Gods: Sanctuaries and Sacred Space in Ancient Greece (1994) 143-160. For the early urbanization of Corinth see C.K. WILLIAMS, II, ASAtene 60 (n.s. 44), 1982 [1984], 9 ff.

along lines similar to their Corinthian counterparts, and whatever ceramic priority the Euboians enjoyed in Magna Graecia in the later Geometric period is not pushed to advantage in the seventh century, and the "omnipresent" Euboian pottery sherds of an earlier era fade into obscurity.[6] The success of the Corinthian venture may well be skewed or overemphasized by the indestructibility of pottery and its tenacity to survive most archaeological contexts, to the neglect of other commodities - such as textiles, metal ores, human slaves and other "soft things," as Osborne calls them, like grain and oil[7] - that do not fare so well and in which Corinthians and others traded. In the words of Salmon: "common sense demands that pottery played only a small role in the total productive and export capacity of the Corinthia; but other items are far more difficult to trace."[8] Nevertheless, it is the Corinthian ceramic industry, its quantity of output and its distribution, that provides a glimpse as to what may have been at the very core of its success.[9] The purpose of this paper is to suggest that the Corinthian pottery industry - both the production and distribution of the pottery itself and of the commodities that it contained - were, to a large extent, determined and defined by Phoenicians.

The essential elements of the Early Iron Age Corinthian pottery industry are well summarized by Coldstream.[10] After the end of the local Late Geometric phase, described as a "quiet and delicate style," the potters of Corinth embarked on their first bold experiments in orientalizing ornament,[11] a few

[5] D. RIDGWAY, The First Western Greeks (1992) 3, boldly begins: "The first Western Greeks were the Euboians." See also ID. in: J.-P. Descœudres (ed.), Greek Colonists and Native Populations. Proceedings of the First Australian Congress of Classical Archaeology, Sydney 9-14 July 1985 (1990) 61-72. For a view which questions the early colonial prowess of the Euboians, see J.K. PAPADOPOULOS, OJA 15, 1996, 151 ff.

[6] This fact cannot be simply explained by the so-called Lelantine War, see S.C. BAKHUIZEN, Chalcis-in-Euboea, Iron and Chalcidians Abroad (1976) 34 ff; ID., Studies in the Topography of Chalcis on Euboea (A Discussion of the Sources) (1985) 31, n. 70, 131 f. decades earlier than in any other centre in Greece.[12] Moreover, Corinthian pottery was distributed in ever-widening circles: Early and Middle Geometric I pots are found only in Corinth and the Corinthia, Middle Geometric II is exported to Delphi and Ithaka and Late Geometric reaches Thera, Smyrna, Dodona and, in small quantities, Magna Graecia, but it is only in the Early Protocorinthian phase that Corinthian products are found in quantity in virtually every major centre within the Greek world, as well as in Etruria and Carthage.[13] In quantity as well as in range of distribution, Corinthian pottery is not matched by any other contemporary Greek ware. There is also an important shift in emphasis in Early Protocorinthian: whereas throughout the Geometric era the shapes of Corinthian pottery served normal consumption needs (eating, drinking, ritual, death), the onset of Protocorinthian sees the introduction of the fully-fledged commodity container. After a lull in its production during Late Geometric, the globular aryballos is not only re-introduced, but manufactured in large quantities and widely exported,[14] although other standard shapes continued to be produced.[15] It is no coincidence that the first pots to be decorated in the new Orientalizing style are the same round aryballoi.[16]

Another important aspect of Early Protocorinthian lies in the overall figurative style, not only the appearance of stylized oriental animals, such as lions, griffins and sphinxes, along with various floral patterns, but the rendering of the ornament in friezes, in addition to the use of incision for outline and for picking out details. As Payne and others have observed, the origin of this "peculiar method of drawing" lies in the techniques of engraving on metalwork.[17] In searching for oriental models that may have furnished the prototypes for this innovative technique and style in ceramics, many scholars have pointed to Phoenician silver and bronze bowls.[18] The innovation of the black-figure style, the use of incision, and the adoption of floral motifs and figural themes,

[15] This discussion does not include the importance of Corinthian coarse-ware storage and transport amphorai, for which see C.A. PFAFF, Hesperia 57, 1988, 29 ff.; I.K. WHITBREAD, Greek Transport Amphorae: A Petrological and Archaeological Study (1995) 255 ff.

[16] Referred to as "small flasks designed as dispensers for perfume or scented oils" by RASMUSSEN, art. cit., 65 f., who also argues that their oriental decoration may have been designed to draw attention to the "exotic" substances within.

[17] PAYNE, op. cit., 7; cf. W.A. HEURTLEY and M. ROBERTSON, BSA 43, 1948, 57.

many of them drawn directly from the Syro-Phoenician pictorial repertoire, reveal, in the words of Markoe: "a direct knowledge of Oriental models; such an awareness can only have been gained from direct contact with and observance of imported Near Eastern goods."[19] In a similar vein, Rasmussen considers the "influence", "impact" or "transmission" of Eastern ivories, metals, terracottas, even textiles, though he admits that the mechanisms of influence are far from clear.[20]

Indeed, the impact of Levantine art on the emerging figural tradition of Protocorinthian is profound, but it demands more than a mere acquaintance with oriental models. Moreover, the orientalizing phenomenon in Corinth is not only unlike that of Athens and other Greek centres of the Late Geometric period,[21] but for the first time in its history it is the pottery of Corinth that exerts its influence on other Greek wares, including Athens, thereby reversing previous trends.[22] In such a context, the whole question of the agency by which an artisan in Corinth not only came into direct contact with a quantity of oriental luxury goods, but had the desire and ability to copy or to transform, adapt or apply individual motifs and iconographic schemes into another medium, has not received adequate discussion. Modern scholarship has been fixated too long on the movement of individual objects - those assumed "prototypes" instantly appreciated and slavishly imitated or adapted - to the neglect of the producers.[23] The processes behind innovations and imitations require actual people, much more than objects.[24]

In addition to the production of Corinthian pottery, there is the whole question of its distribution: who marketed the goods and who carried them? With regard to this question, Culican's warning - that there is a certain naiveté in the expectation that colonial Phoenicians or Greeks can be recognized always in

[24] Here is it worth mentioning Rasmussen's discussion of individual human agency: "... the adoption of Orientalizing at Corinth must have been a conscious decision on the part of a particular potter (or his client or an entrepreneur) ..." RASMUSSEN, art. cit. 65.

terms of the pottery of the motherland[25] - has not been generally heeded, despite some strong attempts to show that ceramics do not necessarily equal history.[26] From an Aegean perspective, it is most often assumed that an Athenian or Corinthian pot must have been carried by an Athenian or Corinthian.[27] In summing up his conclusions on the Greek pottery found at Al Mina, Descoeudres states: "If the various origins of the [Greek] pottery found at Al Mina are direct reflections of its trade relations one would expect sailors from Rhodes, Samos, Euboia and Athens to have been the first Greeks to visit the port at the mouth of the Orontes."[28] Elsewhere he writes: "Thus, after a short interruption at the end of the eighth century, Greeks resume their activities at Al Mina probably not later than around 700 B.C. Again they are sailing under Rhodian, Samian and Euboian colours, with a clear predominance of the latter two."[29] Here the argument is explicitly stated: a Rhodian or Euboian pot found at a site such as Al Mina must have been carried there by a Rhodian or Euboian. Despite the fact that Perreault and others have dispelled the myth that Al Mina was ever a Greek emporion or colony,[30] the possibility that the Greek pottery found there was carried by non-Greek merchants is still often denied. A number of Aegean archaeologists have tempered such a view by conceding that various Greek pottery fabrics may have been carried by compatriots other than those who made the pottery. Cook, for example, argued that the bulk of Lakonian pottery in the 6th century B.C. may have been carried to the West by other Greeks, but again, the possibility that the carriers were non-Greek is ignored.[31] With regard to pottery specifically, Salmon states: "Corinthian vases need not have been exported by Corinthian traders or in Corinthian ships."[32] Nevertheless, Salmon is reluctant to imagine alternative carriers, even though he admits the presence of citizens, metics, foreigners and slaves at Corinth.[33] In the case of Greek pottery found in the southern Iberian peninsula, specifically SOS amphorai, Shefton persuasively argued that it was most

probable that the Greek commodity was carried by Phoenicians.[34] In taking this line of reasoning to its logical conclusion, Shefton went on to ask: "where did the Phoenician traders obtain their SOS amphorai?"[35] Similarly, growing quantities of Greek Early Iron Age pottery in the early levels at Carthage or Tyre cannot be taken as evidence for Greek expansion, whether trade or colonisation.[36] Perhaps the most elegant evidence for the export of Greek ceramics is offered by the Late Archaic shipwreck off the coast of Massalia, carrying East Greek, Attic and other Greek wares bound for the West, showing conclusively that a variety of Greek fabrics could be exported by a single merchantman.[37] During the Classical era, the presence of tons, literally, of Punic amphorai at Corinth prompted Williams to speculate as to whether such cargo was carried by Corinthian or Carthaginian merchantmen.[38]

The organization of the Corinthian export business was impressive, as it dealt with an immense volume of material. How this market developed remains something of an historical mystery. For Salmon, the Corinthian "export market must have originally developed purely by chance..."[39] But chance is a very nebulous agency, particularly in the case of Corinth. In echoing Shefton's question for the most widely exported of all Greek Orientalizing fabrics, we point to the presence of Phoenicians, both in the production and distribution of Corinthian pottery. This represents a classic case of input, in the form of maritime expertise and capital concentration, from the east, especially Phoenicia, discussed by the Sherratts.[40] But the level and extent of Phoenician involvement in Greek affairs, which was more profound than the influence of the East on Greek handicrafts, goes back to an older generation of scholarship.

In the same year in which The Western Greeks appeared, Dunbabin published a paper in which he seriously questioned that the process of orientalization took place by means of material influences alone.[41] In turning his gaze towards processes involving cultural and religious ideas, Dunbabin pointed to the most direct form of human agency. Building on the foundations laid by Maass, Wade-Gery, Farnell and Zimmermann,[42] Dunbabin went on to state:

"An older generation, accustomed to seeing Phoenicians everywhere, regarded them as the bearers of Oriental culture to Greece. For them, Melikertes, the hero whose tomb was shown at the Isthmus, was Melkarth; the cult of Aphrodite, with its sacred prostitutes, was of Phoenician origin; Medea also and the cult of Hera Akraia, with its human sacrifice implied in the slaughter of Medea's children, were Phoenician. Athena was worshipped at Corinth with the title Phoinike [Schol. Lyc. 658; Steph. Byz. s.v. Φοινίκαιον], for what that is worth; and there was a month Phoinikaios at Corinth and in Corinthian colonies. These oriental elements, more strongly concentrated at Corinth than elsewhere in the Greek world, must have been introduced now, in the second half of the eighth century, when Corinth's commerce expands and orientalizing influences appear in her art. Whether they imply that men from Phoenicia or Syria settled at Corinth may be debated."[43]

Dunbabin also drew attention to the view of Herodotos, that the Corinthians, more than other Greeks, had an individual way in which they recognized craftsmen, a feature itself clearly recognized by their contemporaries: "ἥκιστα δὲ Κορίνθιοι ὄνονται τοὺς χειροτέξνας".[44] The lack, however, of large quantities of Phoenician or North Syrian objects at Corinth itself troubled Dunbabin and he went on to speculate: "... it may be that the Corinthians who set up at Posideion and elsewhere at the eastern end of the Mediterranean learnt there to use these cults, and brought them home together with a number of myths and legends."[45] In dealing with myths and legends, however, we are constrained by the literary evidence, and here it is worth repeating that our main literary sources for Greek trade and colonization are Greek, just as our primary sources for Phoenician trade and colonization are also Greek. In these sources there is unabashed hostility towards the Phoenicians, not least in Greek poetry, especially in Homer,[46] and precisely at the time when Greeks adopted and adapted the Phoenician alphabet to their own ends. In her attempt

to reconcile the literary evidence with the archaeological, Winter concluded: "'Homer's Phoenicians' ... do not represent the world of the Phoenicians; rather they present a masterful literary construct, at once produced by and working to produce the broader social, political, economic, and symbolic fabric of the early state in Archaic Greece."[47]

Despite this hostility towards the Phoenicians in Greek literature, the Phoenician complexities of early Corinth - both subtle and blatant - have been steadily mounting, in addition to the evidence presented by Dunbabin. In his discussion of the cult of Aphrodite Ourania as official protectress of Corinth, Williams postulated that the cult originally came directly from Phoenicia; he further noted that a "Phoenician goddess was selected because she supported the major and most powerful maritime state of the time."[48] A related element of Corinthian cult that has never been adequately addressed are the numerous stelai shrines.[49] One of the most interesting of these shrines - Stelai Shrine A (pls. 21, 1-2) - dates to around 500 B.C. and was built within the "no-man's-land" between the earlier and later fortification walls of the city, in the very heart of the Corinthian Potters' Quarter.[50] Although referring to Carthaginian *comparanda* for the Corinthian stelai, as well as parallels from Cagliari and Nora in Sardinia and the Phoenician colony of Motya in Sicily, the excavator of the Potters' Quarter was loth to accept the Phoenician pedigree of the Corinthian examples.[51] The fact that one of the two deposits associated with Stelai Shrine A yielded a bronze phiale, with the dedicatory inscriptio τᾶς 'Αφροδίτας ἐμί,[52] not only bolsters the link to the Phoenician protectress of Corinth, but the rarity of such shrines elsewhere in the Greek world and their similarity to the Canaanite *masseboth* underlines their origin. As Carter has summarized, the sweeping reforms of Hezekiah and Josiah abolished from Israelite worship the use of *masseboth* (erected stones) and *asherah* (tree or wooden staff), as well as other elements of Canaanite religion.[53] Carter goes on to state: "Although forbidden in the worship of Yahweh, masseboth survived among the Phoenicians, and through the Phoenicians they passed in various mutations to cities of Cyprus and the Punic west."[54] As late as the second century A.D. Philo of Byblos speaks of στήλας καὶ ῥάβδονς (stelai and wooden staffs) used in Phoenician cults,[55] and the importance of "oaks and rocks" in early Greek ritual, especially as reflected in Hesiod, and their Levantine origins were recently reviewed and re-stated by O'Bryhim.[56] Carter gathers and discusses numerous examples of sanctuaries in Middle and Late Bronze Age and Early Iron Age Palestine containing a stone *massebah*,[57] as well as related sanctuaries in Cyprus (Kition, Enkomi and Kourion), with especial reference to Late Bronze Age Hazor in Palestine and Sarepta on the Phoenician coast.[58] One of the most noteworthy features of these sanctuaries is the association of *masseboth* with extensive industrial installations, whether pottery workshops (Hazor and Sarepta) or metallurgical establishments (Kition and Enkomi). In 14th century B.C. Hazor, moreover, several large buildings, including potters' workshops and a small shrine were built against the inner wall of the earthen rampart that enclosed the Lower City.[59] In these respects the parallel situation at Corinth is striking and the presence of so many stelai shrines in the Corinthian Kerameikos[60] - the Potters' Quarter - provides an evocative glimpse of an industry largely composed of metics.[61]

More subtile is the evidence preserved in the very foundation myths of Corinth, not least the fact that the Corinthians themselves were dissatisfied with the obscurity of their past.[62] For their founder - Aletes - the Corinthians claimed an independent descent from Herakles and his very name implies "Wanderer", this independent origin is evoked in Thucydides' account (IV.42.2) of the first Dorian settlement on the Solygeian ridge.[63] That Corinth

[63] Ibid. 63.

was founded by sea, not by Dorians from the Argolid, is supported by Thucydides' account and further echoed in a version of the tradition reconstructed by Huxley.[64] It is not coincidental that in much later generations the only Corinthian colony in Sicily and South Italy - Syrakousa - along with Thapsos, have names which are not obviously Greek or Sikel, but for which plausible Phoenician etymologies have been proposed.[65] Moreover, in Thucydides I.13.2 the Corinthians are said to have been the first to adopt the "modern" plan for ships and shipping, and Corinth was the first place in all Hellas where triremes were built.[66] This passage assigns to Corinth what is more often ascribed to Phoenicians.[67] According to Aristotle,[68] the quadrireme was invented by Carthaginians and the Athenian trireme may have been a lesson learned from Phoenician nautical specialists, just as Rome designed its first warship on the basis of a captured Carthaginian vessel.[69] As one of us, Morris, has stated elsewhere: "An irony central to Greek and Roman history is the contribution made by this Oriental enemy to Western navies and their empires ..."[70] Even Demaratus, the "Corinthian" merchant *par excellence*, set up shop in Etruria, a region of contact already exploited by Phoenicians.[71] As an expatriate "fictor" who made things in his new home and taught others to make them, Demaratus, like Eucheir, Diopos and Eugrammos, was, in the words of Ridgway, an heir "to a long tradition that was not wholly Greek."[72] Indeed, the story of Demaratus the entrepreneur, the way he transferred his wealth and residence, married a noble Etruscan lady and sired the fifth king of Rome, with a name -

[64] Ibid.; SALMON, op. cit., 49; G.L. HUXLEY, Philologus 119, 1975, 140 ff. The version as reconstructed by Huxley is well-known and involves the Malian boat: Hippotes, Aletes' father, lays a curse on the Malians, because they refused to join him on a colonizing expedition, to the effect that their ships would always leak. Although the fragment of Aristotle (fr. 554) does not preserve Hippotes' destination, Corinth seems the inevitable answer.

[65] DUNBABIN, op. cit., 20 f.; cf. A. HOLM, Geschichte Siziliens im Altertum (1979 ed.) 80 ff.; G. BUSOLT, Griechische Geschichte bis zur Schlacht bei Chaeroneia (1893) 373f; F.K. MOVERS, Die Phönizier (1967 ed.) 324 ff. Dunbabin names Thapsos and Syrakousa as among the very few along the entire east coast of Sicily which answer to Thucydides' description of a Phoenician settlement, though the lack of eastern imports led Dunbabin to question Phoenician involvement.

Lucius Tarquinius - that bears no ethnic or etymological resemblance to the father's identity, may well provide one model of Eastern penetration of the Aegean.

To what extent any one piece of Phoenician evidence at Corinth can be pressed remains moot, but the basic pattern is revealing. The most archaeologically visible sites of the Early Iron Aegean, such as Lefkandi, Knossos, Athens, as well as Corinth later on, are prominent exactly for their eastern complexities. The Phoenician aspects of Corinthian cult - such as sacred prostitution and child sacrifice reflected in the story Medea and her children - are overwhelming and unique,[73] and these are strengthened by the presence at Corinth of various proper names with the root *Phoinik-*.[74] The greater area of Knossos, described recently as an urban nucleus in the "Dark Age,"[75] witnesses an interesting mixture of "native Subminoan" elements with a plethora of ideas that flowed in from the eastern Mediterranean, whether, in Coldstream's words, "through bronze heirlooms of Cypriot origin, or through artifacts imported from the Levant, or through Oriental imagery introduced by immigrant eastern craftsmen."[76] Tekke near Knossos has added a Nuragic jug from an Orientalizing tomb in association with material of a "Phoenician jeweller."[77] More "easterners" have recently come to light from Eleutherna[78] and Kommos;[79] the latter also producing evidence of "westerners," especially Sardinians.[80] Kommos has also yielded a cult focusing on a shrine with stelai, once described as "a curious structure with three tapering stone pillars" (that is, *masseboth*), similar to the Stelai Shrines of Corinth.[81] The quantity of eastern imports and influences in Athens can be attributed to more eastern immigrants, especially craftsmen, the progenitors of the metics of historic Athens and the Piraeus, who played their part in the formation of early Greek society.[82] Our new look at Corinthian stelai recommends a closer look at the upright stone slabs that are an integral part of the so-called "altar" of Aphrodite

Ourania in the Athenian Agora, a monument so far restored with a superstructure and crowning elements which hide the stelai.[83] Were they inspired by, or part of, a Semitic installation for a Near Eastern goddess?

Perhaps the closest analogy to direct Phoenician involvement in the production and distribution of Corinthian pottery - and the commodity or commodities this pottery was carrying - is the situation in Rhodes, especially the Phoenician unguent factories.[84] Beyond the actual production and bottling of the liquids on Rhodes, the so-called *Kreis- und Wellenband*, or "spaghetti style" of pottery that was probably made by Phoenicians living on Rhodes, has been found in ever-increasing quantities in Magna Graecia, not least at Pithekoussai.[85]

Of all of the Aegean sites discussed so far, Lefkandi has not only produced the earliest known imports from the east since the end of the Mycenaean era,[86] but is the site topographically closest to the ideal Phoenician trading settlement, as described by Thucydides (VI.2.6) for Sicily. Rather than representing a spontaneous Greek self-generation, as is often assumed by Aegean archaeologists,[87] the precept of Lefkandi - like Corinth later on - is one inspired by eastern traders and settlers. If Lefkandi and Corinth are places where Greeks and Phoenicians/eastern Mediterraneans co-existed, the sort of place from where a "joint venture" to the west may have been mounted, then the ramifications for Greek and Phoenician expansion in the West are profound. From such a perspective, the "joint venture" or Phoenician and Greek "common interests," as discussed by Aubet,[88] as well as Niemeyer and Docter,[89] even Burkert's "mutual competition,"[90] or the "few Phoenicians and a lot of Euboians" of Ridgway,[91] takes on a very different meaning, through a shift in focus from the exclusively regional to the more broadly Mediterranean.[92]

KADMOS AND EUROPA, AND THE PHOENICIANS

1. The discussion in Der Neue Pauly (by K. Meister) of the Phoenicia-problem of the Kadmos-story is quite inadequate. Especially a mere reference to Edwards' monography on Kadmos the Phoenician is insufficient to settle the matter. (Vian interprets the story of Kadmos as containing traces of an Indo-European tripartite society. As I do not believe in Dumézil's theories on this point, I shall not discuss them.)

2. Kadmos and Europa

The story of Europa is quite straightforward: While she was on the shore with her companions, Zeus approached her in the shape of a bull. She mounted the bull, it went into the sea and took her to Crete. There it mated with her. The children were Minos and Rhadamanthys. Afterwards she married king Asterios.

There is in her story nothing about Kadmos. He would have gone to continental Greece, not to Crete, to search for her. And so he did not find her and instead founded Thebes. He would have been her uncle. So there is no story about his search: it is only said that he went the wrong way and did not find her. It is clear, then, that there was no (story of the) search. It would have been a story that did not begin. So it becomes clear that Kadmos' adventures were only later linked to the story of Europa, and that originally he had nothing to do with her. This means that his connection with Europa cannot be used as an argument to show that Kadmos came from Phoenicia.

Also there is a story parallel to that of Europa, the story of queen Pasiphae. This makes clear that it was expected that the queen 'married' the supreme god, in the shape of a bull. The cult of the bull was essential in Crete – one need only think of the ceremonial games, sports around the bull. The conclusion is that the story of Europa is a typically Cretan story, which has nothing to do with Phoenicia.

Further, the name of Europa is remiscent of names beginning with Εὐρωπ- or Εὐροπ-, found in Greece north of the Gulf of Corinth. This name cannot be Indo-European, and as it is well established in northern Greece, must be of Pre-Greek origin. (The word cannot contain εὐρυ-, of which the second -υ- would have been preserved.) On these names see Sommer 1937, 185 n. and 255ff. (Krahe's Balkan-illyrische geographische Namen 73f. is insufficient; see Beekes 1995/6, 18–21). There are two towns called *Eurōpos* in Macedonia (one in Almōpia) and a third on the Peneios (see the map in Ninck 1946, 16); there is a river Eurōpos (that flows into the Peneios; Ninck 17).[1] Cf. further the Κασσωποί.

It has been suspected that she was a supernatural being, perhaps an earth goddess (Berve 1966, 468). This is rather uncertain, as our data are very meagre. However, they make it clear that she was not merely a human being. We find a Demeter Europia and a Hera Europia (Ninck 1946, 17). It is told that Europe was hidden by Zeus in a grotto near Teumessos, east of Thebes (id. 17). Less clear Bühler 1968, 44f.

The conclusion is clear: Europa was an old, supernatural figure in Greece, a goddess or semi-goddess, probably of Pre-Greek date. And her story fits completely with what we know of Crete. There is no basis for a Phoenician origin. Several things remain unclear, however. First, we do not know what exactly she was. Then, her provenance is uncertain. She seems at home north of the Corinthian Gulf. How she came to be associated with Crete is not known. Perhaps she was a Pre-Greek figure which was also venerated in Crete. I am very sceptical about theories on peoples moving to Crete. In spite of the unanswered questions, however, it remains clear enough that she was a Greek, rather a Pre-Greek figure which had nothing to do with Phoenicia.

As to the question how Europa came to be associated with Phoenicia, I think that it is not too difficult to imagine a possible origin. Her father was called Phoenix in Homer (Ξ 321), which may have been one reason to suppose a Phoenician origin. Then, the question may have arisen from where she came, carried by the bull. If one imagines a shore from where she could have come, one may think of Greece, or Anatolia, Phoenicia, or Egypt. The connections of Phoenicians with Crete, which have been demonstrated by archaeology,

[1] Dura-Eurōpos in Syria, well known from the excavations, got its name when the town was re-founded by Seleukos Nikator in 280, from the Macedonian Eurōpos (Ninck 1946, 251 note 17: 1).

may have been a factor that made it natural for Greeks/Cretans to think of Phoenicia. (In fact, of course, it is hardly possible to assume a Phoenician origin, or how did she come to Crete; few shall be willing to consider the possibility, suggested in Antiquity, that she was abducted from there.) Returning to Kadmos, we conclude that the connection with Europa was not original, and that Europa did not come from Phoenicia.

As to Kadmos and Europa, I would keep open the possibility that they were associated because both would have lived in Boeotia. But this cannot be verified.

3. The continent Europa

The name for the continent was originally also a country in Macedonia; Hdt. 6, 43; 7, 8 β1. In hAp. 251, 291, it is Central Greece. This fits exactly with the origin of the names with -ωπ/οπ-. It is, then, a Pre-Greek name, the name of a country. A direct connection with the goddess Europa does not seem to exist (though it is possible that the name, of which the meaning is unknown to us, was ultimately the same). It is improbable, then, that the word had a Semitic etymology. On names of countries in -η see Sommer 1937, 254.[2] See Ninck 1946, 17–19 (who still tries an IE etymology).[3] (Very daring speculations in Andrews 1969.) Iustinus writes that east of the Thracian mountains, in Europe, a king Europs ruled (Iust. VII.1). Ammianus Marcellinus puts the Roman province of Europe south of Constantinopel, on the Sea of Marmara, with the town of Perinthos (XXVII. 4. 12).[4] In Byzantine times there was a diocese Europa on the eastern coast of Thracia. (See Gommers 32, without reference.)

4. West's alternative

The idea that the hero Kadmos was secondarily derived from *Kadmeioi/Kadmeia* is quite possible. The idea has been advanced earlier; see Edwards 1979, 188. The last to do so was M. L. West (1997, 448ff.). He explains *Kadmeioi* from *Qadmiyūma* ('peoples of the east', Ugaritic *qdmym*) or **Qadmiyyîm* (a plural, I think, but West does not indicate what form it is). The words would mean either 'the men from the east' or 'the men of old'. He then argues that Phoeni-

---

[2] The gloss Εὐρώπη· χώρα τῆς δύσεως H. is understandable (it has the addition ἡ σκοτεινή); a second gloss εὐρῶπις· ἡ πατρίς H. is called *obscurum* by Latte.

[3] The idea of the European Union to take Europa on the bull, generally known as a Phoenician princess, as a symbol for the union, was not a happy one.

[4] This Europa is indicated on the (second) map XII of Kiepert.

cians in Greece might have called themselves 'Men of the east', just like the Norsemen called themselves Norsemen. In n. 33, however, he mentions that the Phoenicians, where we know it, did not call themselves thus, but 'Canaanites'. He himself prefers a different theory: "seeing the impressive ruins of the Mycenaean citadel, they attributed them to 'the men of old', the **qadmiyyîm*. They might also have applied the word to those occupants of ancient graves who in the eighth century were beginning to be the object of hero cults: we recall its use [of the word *qdmym*] of the Ugaritic Healer-heroes. Its ambiguity, together with the immigrants' natural desire for status, might then have encouraged the notion that those **qadmiyyîm* were actually *bnê qadm*, sons of the east – or sons of Kadmos." I find this such a complicated and improbable series of assumptions that it hardly deserves further discussion.

Luisa Prandi (1986, 46f.) comes close to the idea of West. She assumes that "a group of people" travelling from east to west reached the coast of the Aegaean (first in Thracia). She does not specify their exact origin, but they must have spoken West-Semitic, for she accepts the Kadmos etymology. Nor does she say explicitly that they came by ship, though I think that this is what she means. What we see, then, is that she does no longer simply say that the Phoenicians settled in Boeotia (in the same way as in the case of their other settlements in the Mediterranean).

West's hypothesis too is more vague than about the usually assumed arrival of Phoenicians (449). He says that "a group of Semitic-speakers, presumably Phoenicians" lived in Boeotia. He adds: "We need not think in terms of an invading horde: a peaceful trading colony is much more likely." West apparently does not reject the possibility of an invasion.

Now if both authors assume Phoenicians coming in the well-known way, we are back to the traditional conception. But they clearly want to leave open the possibility of a different scenario. I discuss here very shortly this proposal: they were Semites, but perhaps no Phoenicians, migrating toward the Greek mainland, by ship or even over land.

West defends the presence of a Semitic people by saying (p. 449) that "it is no more out of the way than the well-attested settlements of (1) Achaeans in Crete or Cyprus, (2) of Assyrians in Anatolia, or (3) of Phoenicians in Sicily, Sardinia, Spain, and North Africa." (The numbers are mine.) This looks imposing, but it is not convincing.

Nr. (3) refers to the well-known Phoenician settlements and is not now under discussion. (1) concerns Greeks, but we are looking for a

Semitic people travelling to Europe. (2) shows the maximum range of migration (though in this case again it concerns only a settlement of merchants) of a Semitic people. But Anatolia is not very far from the home of this Semitic people; it can be reached overland; it is an adjoining country. So the conclusion is that there is no evidence for a Semitic people migrating to Europe, other than the Phoenicians through their trade-settlements. An even better parallel are the Etruscans migrating from north-western Asia Minor to Italy. However, they are not Semitic, nor coming from the area of the Semitic peoples. The point is not whether the supposed migration is in itself imaginable, but that no Semitic people is known ever to have made such a migration. This means that the alternative is without any support and therefore quite improbable. The traditional view thus is replaced by a more improbable one.

5. Kadmos from Kadmeioi

In her 1986 article, p. 42f., Luisa Prandi discusses the occurrences of the name Kadmeioi in Homer.[5] She draws a conclusion I cannot agree with.

Kadmeioi and its derivative Kadmeiōnes occur seven times in the Iliad; in the Odyssea only in λ 276; that is eight times in all. Kadmos is mentioned only once, ε 333, as the father of Ino. Now, Prandi concludes from the frequency of the term Kadmeioi and the near-absence of the name Kadmos that the name of the hero was later derived from Kadmeioi. The passages in book Δ recount the story how Tydeus visited Thebes and in athletic games won the victory of all his opponents. Furious, fifty Kadmeioi laid an ambush, but Tydeus killed them all (except one). So in fact these three passages can be reduced to one, where the Kadmeioi are mentioned. There was no reason to refer to Kadmos. It would have been much too long, and out of place in the context. In Ψ too, a hero is mentioned who defeated the Kadmeioi in games; again this is a very short remark, where a mention of Kadmos would be out of place. The place in the Odyssea mentions the reign of Oidipous, where mentioning Kadmos would be hardly possible. So what we find is that Kadmos is not mentioned because Homer had no need to mention him. No conclusion on the origin of the name Kadmos can therefore be drawn from Homer, though it is quite possible of course that Kadmos was derived from Kadmeioi or Kadmeia.

[5] Europa e i Cadmei: la 'versione beotica' del mito. The title just means the part of the myth that is situated in Boeotia; we do not have a Boeotian version.

6. The name Kadmos

Above we mentioned the etymology that connects the name with West-Semitic *qdm* 'east'. This idea is very old; e.g. Movers 1841, 516f., but it is even older (see Edwards 1979, 58 n. 60). We saw it in section 4 above. This etymology can easily be wrong. Further the name has been connected with κέκασμαι 'excel', 'be equipped' (on its etymology see García-Ramón 1988/90; he does not discuss the name, and I do not know what to conclude from it, perhaps he found it too uncertain; I see no proper names in -μος). Given the evident Pre-Greek etymology, there is no reason to consider an Indo-European origin. (The connection with Armenian *kazm-* 'equipment, ornament' is impossible, as Greek should then have a voiced stop.) The note in Hesychius κάδμος· δόρυ, λόφος, ἀσπίς. Κρῆτες does not help much.

It has long since been observed that the name is found as the name of a mountain and a (nearby) river in Caria; e.g. Fick, 1905, 24, 84, 128 and 135. This is very important, as it shows that the name is a Pre-Greek element. I call 'Pre-Greek' the substratum language of Greek (German 'Vorgriechisch'). See my discussion in 2003b. The basic study of these elements is Furnée 1972. We know that this language was also spoken in western Anatolia, as is shown most clearly by the geographical names; see the study by Haley and Blegen 1928. Further see Krahe 1954, 143–180, and Katičić 1976, 16–97. As to these names, Haley says (in Haley and Blegen, 1928, 142): "Certainly it is not likely that places so far inland as Hermos, Kadmos, ... owe their names to Greek influence." Thus also Sakellariou (1958, 370). Fick (24) further mentions Καδύανδα in Lycia and Κάδηνα in Lycaonia, but we cannot be sure that these forms are related. One might object to the comparison of a personal name with geographical names, but we know that, in Anatolia, the same name can be used for a mountain, a river or a person. See on the point Sundwall 1913, 271 and my note on Pylaios in 2002, 236 n. 42. Note further the presence in Asia Minor (in the north-west) of Καδμῖλος, one of the Cabires; it is generally accepted that the form is derived with the well known suffix -ιλ- from Κάδμος (on the name see Beekes, 2004, 466); this suffix clearly shows that the word is of Anatolian origin. A further important indication is a gloss of Stephanus of Byzance which says: Καμμανία· μοῖρα Θεσπρωτίας· ἐξ ἧς Κάδμος ὁ ποταμός. The area and the river have not been identified with certainty, as the Barrington Atlas does not give it. Kiepert gives the river as flowing north into the Thyamis, with a question mark.

The structure of the word as a whole also fits well, compare the island Πάτμος, the mountain Λάτμος, and the mountain Λάκμος in Athamania, east of Ioannina. All these forms have *CaC-m-(os)*, and we find them over the whole area (from Greece to Asia Minor).

The sequence -δμ- is rare in Greek. It is hardly found outside derived or inflected forms, as in σκυδμαίνω. But we find it in Pre-Greek forms. Cf. Ἰάδμων of Samos, which is clearly Pre-Greek (with ἰα-, cf. Ἰάπετος). Further there is ἀδμωλή, ἀδμενίδες.

There is also a form Κάσσμος. The development -δμ- > -σμ- is problematic in Greek. The treatment by Schwyzer 208 does not give a solution. Furnée 1972, 248ff. notes that τ/σ (or δ/σ) is a well known phenomenon in Pre-Greek. Note that we also have Κάσμιλος.

The conclusion is that the name is either derived from Καδμεία 'the Theban citadel' (or Καδμεῖοι 'its inhabitants', as we saw in section 5), or a name that is evidently identical with the name (of the mountain and river) Κάδμος, which means that in both cases we are concerned with the same Pre-Greek word.

7. The improbability of Phoenicians

There are several reasons which make the story that Phoenicians founded Thebes improbable.

1. As far as we know, no other Greek city was founded by Phoenicians, i.e. the assumed occurrence is without parallel in Greece.
2. Thebes is not a probable place to be founded by foreigners; it lies in the heart of the country, and not on the water. It may well be said to be the most improbable place one could think of to have been founded by foreigners.
3. There is no trace whatever of Phoenicians in the town or its surroundings.
4. The Phoenician expansion to Europe begins around 1000 B.C., not earlier. A date like 1400 or earlier, as is supposed for Kadmos, is therefore impossible.
5. In the course of the discussion I have not seen any separate argument in favour of the Phoenician hypothesis. One thinks of such arguments as those proposed by Astour (1965, 113–224) about "mythical" aspects, where he argues that the stories about Kadmos originated in West-Semitic myths. Edwards refutes the arguments

one by one, and concludes that none of them can be maintained; they are unreliable (139–159).[6]
6. The Greeks had no idea about these dates and about the possibility of foreign peoples entering Greece; thus they accepted that the Danaoi came from Egypt.

The most problematic point is the date. If the story that the Kadmeioi were Semites who settled in Boeotia is true, when could this have happened? The myth is usually dated (several generations) before the Trojan War, on the basis of which modern scholars think of about 1400 BC. West (1997, 449f.) e.g. adds: "It seems to me just as plausible a hypothesis, however, that our immigrants were Phoenicians of the Iron Age, say in the ninth or eighth century, . . ." Against such a late date can be argued that there would be a lively remembrance, and that it would be archaeologically recoverable.

The early date seems hardly possible for two reasons. First, it is most improbable that Semites settled in Greece, except the Phoenicians. There is not the slightest evidence that other peoples than the Phoenicians ever settled in Europe. Second, even if this were so, it is improbable that the Greeks would have any remembrance of it. In general they have only few and vague or incidental recollections of the Mycenaean Age (I think of such things as the boar's tusk helmet). The fact that one assumed that Phoenicians could have arrived before the Trojan War proves that they had no idea about the chronology: if it is true that the Trojan War occurred in or near the thirteenth century, this is far from the ninth or eighth century which are the probable dates for Phoenicians (as indicated by West).

The conclusion seems simple: the high date is impossible for the Phoenicians.

Several negative comments have been given. I mention Emily Vermeule who wrote (1971): "it appears that there is no early connection, in the Greek mind at least, between Kadmos and the Near East". Phoenicia was popular after the notorious 'Medizing' of Thebes in the Persian Wars. "His genealogy is late and confused." "Pindar the Theban has no idea of any eastern connections in the history of his city's founder." The finds from the east found in Thebes are what one might expect, it is nothing spectacular, it is like elsewhere (p. 185).

It is also remarkable that no other persons around Kadmos are known. Most often mentioned is Membliaros (e.g. Hdt. 4, 147). Now

[6] The conclusions of Edwards' research are often 'negative'. As a result, the reader is quite surprised that she gives at the end often a 'positive' comment on the possibility that the Kadmos story has a historical background. See also on section 10.

we know that this was the name of an island, Anaphe, east of Thera. It was also called Bliaros. This means that the name was reduplicated: **Me-mliaros* > Μεμβλίαρος, beside **Mliaros* > Βλίαρος. This is no doubt a Pre-Greek name, reduplication in geographical names of (Indo-European) Greek origin are unknown. (Fick 57 added: "aber die Namen haben eher karischen als phönizischen Klang". I don't know whether here again the man has the same name as an island, or whether this was just due to a wrong interpretation.) (I assumed that Pre-Greek did not have the phonemes *e* and *o*; so the reduplication vowel may have been *i*, with *e* as a (phonetic) variant. Cf. Μεμβλίς· Μῆλος ἡ νῆσος H. and Μίμαλλις.) So it is strange to see that people said to have belonged to Kadmos' group had a Pre-Greek name. It is remarkable that nothing has been found that could confirm a Phoenician origin of Kadmos. On the other hand, there is no problem to assume that the story is Greek fiction.

8. Edwards' treatment

I shall now discuss the arguments of Edwards' book more in detail. I shall follow her sections (pp. 45–204; ch. I and II, pp. xii–44, are introductory).

III. Phoenician origin (45–65). There is a long list of scholars who have rejected Phoenician origin or assumed that Kadmos was derived from Kadmeia (which means that the figure is fictitious). There are now two groups, one that interprets 'Phoenicians' as Minoans, or Carians, or Illyrians, or Pelasgoi; and another one that considers Kadmos as a real Phoenician, supported by the etymology of his name (p. 57). Archaeology came to show that there have been no Phoenicians in Thebes or Thera. Then, with the discovery of Ugarit, a parallel to the story of Europa was found. Edwards is rather negative on scholars who accepted Phoenician origin, as Graves, J. Bérard (who connected the Hyksos), Huxley (who connected the Luwians), Stubbings, Astour; Dussaud and Schaeffer were impressed by the discovery of the new texts from Ugarit. So no clear positive argument is given.

IV. How ancient is the Phoenician element? She refers that Gomme and Vian opposed to a Phoenician origin. Gomme (1913) pointed out that the oldest sources do not mention a Phoenician relation. Edwards answers that this is an argumentum e silentio. The oldest source is Pherekydes, who stresses Kadmos' Egyptian origin (!). She then states (74): "We must agree with Gomme that Kadmos and Europa may not have been originally related, as is suggested by the fluctuation

in the later tradition about their precise blood-relationship (...) as well as by the silence of the earliest sources, which however may not be quite so complete as Gomme argued" (referring to a fragment of Stesichorus). She then concludes that it has not been proven that Kadmos did not come from Phoenicia (86).

V. Kadmos, Minoan Crete and the meaning of Φοῖνιξ (87–115). There was no colonisation of Greece by the Cretans, but there were settlements on the islands (Rhodes, Thera). She then points out that there are indications for the presence of Cretan settlements. There is no firm conclusion of this section, but Cretan presence in Boeotia is not a point of discussion.

VI. Bronze Age Phoenicians at Thebes? Edwards notes two problems: the date of the Phoenician expansion, and the position of Thebes (not on the sea). She points out that there was not much contact in the 9th and 8th centuries, but that there was contact in the period 1600–1100, as seen in objects and in Mycenaean pottery (in 1365 Ugarit was destroyed but it soon recovered; when it was destroyed for the second time at the end of the 13th cent., it did not recover). However, what we need is Phoenicians (at least Semites) coming to Greece, not the other way round (which may have made little difference for the Greeks). Edwards calls this "not at all implausible" (128), but the fact remains that this presence has not been demonstrated.

She gives much attention to Ugarit. She points to a text where the king of Ugarit says that "all his ships now happen to be in Lycia". Another ship is said to have been in Kptr = Kaphtor, i.e. in Crete. Elsewhere is spoken about 150 ships (Edwards 126–129). Though she admits that only a handful of ships is mentioned in the relevant journeys, it must be admitted that the Ugaritians apparently sailed to the Aegaean. However, essential is for our problem that we have no evidence pointing to settlements made by the people of Ugarit in these regions.

As to the position of Thebes, Edwards refers to Mycenaean material in the Gulf of Euboea and farther, and to Aulis from where the Homeric fleet departed. She further refers to trade goods found in Thebes. But Emily Vermeule stated that this is nothing particular: this is what you may expect in a rich town. Edwards concludes (134ff.) that there was contact. However, the essential point is not made: there is no evidence for Phoenicians coming to Boeotia or Greece; there is no evidence for expeditions so far away from the Syrian coast.

VII. Oriental parallels to the Kadmos legend. Influence of West-Semitic religion is open to grave criticism. She then points to the

etymology (*qdm* 'the man from the east'). This etymology of course may be simply rejected: it could well be a look-alike. Astour's connection with the Cabires is rejected (as I did above). She ends with: "this would not rule out the possibility of an oriental presence in Mycenaean Boeotia". Again: it might have been, but there is no evidence.

VIII. Chronological problems. The founding of Thebes is dated to around 1400. Here we return to what was said above: the founding would have been long before the expansion of the Phoenicians, so the Kadmos story is next to impossible. (Edwards repeats the point of the introduction of the alphabet, which is generally considered post-Kadmos.)

So the conclusion is that the objections have not been removed: the story is too early for the arrival of the Phoenicians, and there is no evidence for another origin. We cannot just say that "it could have been". Combined with the position of Thebes, which is most improbable for a Phoenician settlement, the negative arguments are decisive. So Edwards' arguments fail to convince. My conclusion is that Edwards' book does not adduce any serious evidence for a Phoenician (or other oriental) group that settled in Greece. Therefore the Phoenician option must definitely be given up.

I combine this with the fact that the name Kadmos is most probably either (re)constructed from Kadmeia (and so purely fictitious), or Pre-Greek, like the mountain and river in Caria. Another man mentioned is Membliaros, which is the name of an island, which is also Pre-Greek.

It seems that there is more. It is stated that Kadmos was the son of the Boeotian king Ogygos. Edwards rejects this (p. 49), because the source is very late (it appears in Photius and in the Suda). But Ogygos is also mentioned in Pausanias (9.5.1), though he does not say that Kadmos is his son and duly relates that Kadmos is Phoenician. It is apparently an old story, as Pausanias adds: "from him the mass of poets have given Thebes the title Ogygian". Ogygos is known as a kind of Primeval Man, so when Kadmos lived in his time, he will have been there from The Beginning Of Time; he will have been there of old and will not have come from a far country. Here we may have an element of the original background of Kadmos in Boeotia. It shows him as an (extremely) old local figure.

More difficult is the following. "Der samothrakische Kadmos ist oft mit dem gleichnamigen phoinikischen Gründerheros von Theben verschmolzen" (Ch. Tsochos in DNP 11,27 s.v. Samothrake). The

relation between Kadmos and Harmonia is unclear. Kadmos would have married her in Thebes, or in Samothrake. She is sometimes called the daughter of Elektra, not of Ares and Aphrodite. Also, Kadmos would have abducted her, after which there was a (ritual) search for her. If one accepts this version that Kadmos was so much involved with religious conceptions, it is improbable that we have to do with a Phoenician. As to Harmonia, Roscher s.v. noted that her name may have been altered by popular etymology, which I find a very attractive idea. Vian (142 n. 4) mentions a reading Ἀρμενία, which he considers as a simple mistake (it is found in Schol. T on Il. Γ 189); but how can we know? (Vian also mentions a reading Hermioné, e.g. Hygin. Fab. 155.)[7]

The last point is not very strong, but we saw that there are no positive arguments, and that so early operations in Greece must be called impossible. This item of Greek imagination should now finally be forgotten.

9. How did they come to be 'Phoenicians'?

The most vexing point is the question how the relevant people came to be considered as Phoenicians.

Europa could easily have been made to come from Phoenicia. The essential part of her story seems to be that she was brought to Crete by a bull from the sea. The Cretan story just seems to be that a bull came from the sea . . . without any question being asked from where the bull came. When the question was asked, Crete was strategically positioned with respect to Phoenicia: apart from Rhodes, Crete is the part of Greece that lies nearest to Phoenicia. In Homer she is called daughter of Phoinix. This name may have induced her Phoenician origin.

As to Kadmos, Vian 56–69 argues for Miletus as the place where the change occurred, in the international port. This seems quite possible. (He suggests that it happened in the period 650–550, so rather late.) Of course, Kadmos may simply have followed Europa. The Greeks will have accepted the idea without difficulty, unaware of any problem; it was just 'interesting'.

10. Kadmos and the alphabet

This is not a real problem. Herodotus (V 59?) states that the Phoenicians who came with Kadmos brought writing to Greece. That the

[7] Such a 'speaking' name as Harmonia (taken as ὁμόνοια) I have always considered to be a mistake. If it was an older goddess, she will not have had such a Greek abstract as a name. Also, there can have been two names that resembled each other.

Greek alphabet derives from the Phoenician one is certain, but we do not know exactly when and where it was taken over. The earliest texts date from the end of the eighth century. The actual adoption may have been a century earlier, that is at the end of the ninth century. (Presently Ruijgh 1998 argues for a much earlier date, around 1000 BC, assuming that earlier texts were written only on perishable material.) But the suggestion is probable that the arbitrary choices made in the adaptation of the Phoenician alphabet prove that it was adapted by one man at one moment. Wachter in DNP (1, 537ff.) refutes earlier dates than the usual around 800.

The Greeks clearly remembered that they had their alphabet from the Phoenicians. For Herodotus all Phoenician activity in Greece was associated with Kadmos. So it is only evident that the introduction of the alphabet was also ascribed to him and his men, once Kadmos had become a Phoenician. Of course, it is unacceptable to base the date of the introduction of the alphabet on the dating of Kadmos. As the coming of Kadmos is generally dated to 1400 or earlier, the alphabet was not introduced by Kadmos. It can easily be a later addition to the story of Kadmos. The point, then, does not interest us here.

Edwards' treament is not too clear (174–179). She discusses the idea, sometimes proposed, that it was not the alphabet that Kadmos brought, but Linear B. She rejects this idea, but then remarks that "the possibility that Kadmos' association with writing goes back to the Bronze Age cannot be wholly excluded". Here, as in other places, she rejects an idea as improbable if not impossible, but then at the same time keeps the possibility open. This is a most unhappy way of presenting the issue.

11. Schachter's hypothesis

In 1985 Schachter, the author of the Cults of Boeotia, proposed quite a different interpretation of the myth of Kadmos. He points to movements of people from Asia Minor to Greece in the Geometric and early Archaic periods. The first is the advent of Hesiod's father from Aeolis (Kyme) to Askra in Boeotia. The second would concern those who brought the service of the Cabires to Thebes. (Here he suggests that the name Cabires may have been of Semitic origin. I have just shown conclusively that this name is Pre-Greek, i.e. not Semitic; Beekes 2004.) These immigrations might have been the example for the myth of Kadmos. One problem is that we are here concerned with Greeks, not with Phoenicians (as the author admits; though he points to the traces of a non-Greek language in the cult of

Samothrace). Also there is no indication that these movements were ever connected with the founding of Thebes. I don't think the facts mentioned had any impact on the myth of Kadmos. Also, to connect two facts with the Kadmos story, does not make the case stronger; it rather gives the reaction that one of them will not do.[8]

12. Kadmos in Cilicia

Nonnos (1. 154–2.634) has the story that it was Kadmos who saved Zeus in the struggle with Typhon, near Korykos in Cilicia. The monster, which had taken Zeus' weapons while he was after Europa, subdued him and took his sinews. Then Kadmos arrived in Cilicia, in his search for Europa. He gets from Pan a herd and a herder's flute. The monster is enticed by Kadmos' music. Then Kadmos asks Zeus' sinews, pretending that he will make a new musical instrument that will be even more beautiful. Zeus gets back the sinews and this time conquers the monster. As was suggested by Edwards (p. 41) and proven by Tanja Scheer (1993, 307–320, esp. 316f.), Nonnos himself invented this version. It is well known that the Typhon story originated in this corner of the world, as there is e.g. the Hittite story of Illuyankas who takes the god's (= Zeus') heart and eyes. We have two Greek versions of the Typhon story earlier than Nonnos, where Typhon takes Zeus' sinews, in Apollodorus (1.6,3) and Oppianus' Halieutika (3.7–15). In the first author Hermes and Aigipan get back the sinews, in Oppian it is Hermes with his son Pan of Korykos.

Now it is clear that Kadmos has been put in the place of Hermes and/or Pan; e.g. he gets his instruments from Pan. There are several circumstances that form a connection between Hermes and Kadmos. In the cult of Samothrake, Hermes was equated with Kadmilos, one of the Kabeiroi. And Kadmilos is easily connected with Kadmos, who can be well used in another dragon battle. Also, there is no confirmation anywhere that Kadmos played a part in this story, therefore it will be Nonnos' invention (Scheer, 316f.). Nonnos will have ascribed this feat to Kadmos, because he was the grandfather of Dionysos, who is honoured in his Dionysiaka. Further, a connection between Kadmos and Cilicia was suggested by the fact that Kadmos had a brother called Kilix. The story, then, is late fiction that is irrelevant to the Kadmos-myth.

---

[8] Schachter analyses (151) Καδμεῶνες as Καδμε- plus the suffix -ων, which is impossible; Greek (and Indo-European) did not have stems in *-e*; see Beekes 1994.

Appendix. The name Phoinikes

We know that *Phoinīkes* is the Greek name for the people, who called themselves Canaanites. We have the mention by Herodian (FHG i 17, iv 627; fr. 358?) that Hecataeus used the form Χνα = ἡ Φοινίκη, and from Choeroboscus (Bekker, Anecdota fr. 254) ὁ Χνᾶς, τοῦ Χνᾶ. In the New Testament we find Χαναάν (see Aubet 1996, 5–12).

The first is that we find the name frequently as a geographical name. I base myself on the new atlas (the Barrington Atlas). Here we find names with Phoinik- sixteen times, four times as a river, twice for a mountain, thrice as a 'water' (once noted as 'gulf', sinus); the other nine occurrences are towns. The name is found nine times in (present-day) Greece (I include here the one in Albania, just across the border) and nine times in Turkey. They are the following (I give the number of the map and the sections and arrange them from northeast to southwest; fl(uvius), M(ons), no siglum is a town (unless stated otherwise); there are three forms: (*Phoinik*)-*s*, -*e*, -*ous*; question marks indicate uncertainty, as in the atlas):

In Greece:

54B2 -*e* in Epirus; and 54B2 -*e* in Epirus (two cities close to each other);
55C3 -*s*? fl.: near Thermopylae;
58B1 -*s* fl.: N of Peloponnese, W. of Aigion;
58B4 -*ous*: Gulf in the S. of Messenia;
60 B2 -*s*: S. coast of Crete, east of Tarra;
60B2 -*ous* Limen: water, ibid.;
60B2 -*s*?: S. coast of Crete, S. of Rhithumna.

In Turkey:

56C4 -*ous* Sinus: W. coast, N. of Erythrai;
61G4 -*s*: SE of Knidos;
61G4 -*s* M: ibid.;
65B5 -*e*: Lycia, S. of Xanthos;
65D5 -*s*: Lycia, S. of Limyra;
65D5 -*s* fl: ibid.;
65D4 -*ous* M: Lycia, E. of Phaselis;
65D5 -*ous* fl.: Lycia, S. of Phaselis.

So there is an almost continuous chain from Epirus to Phaselis. (This may be important for the origin of the name of Phoenicia: it was just the following step. Note that there are no instances found in Cilicia, map 66.) The word did not refer to (the presence of) Phoenicians, as we have no indication whatsoever that the Phoenicians founded

cities on the southern coast of Turkey; also they would have given their settlements names of their own (and the Greeks would have used these). Nor is it probable that the presence of a minority of Phoenician merchants would have been the reason to call all these places *Phoinik-*. As the word is of non-IE origin, i.e. a loan from the Aegean substratum, one might consider the possibility that the name (e.g. those on the south coast of Turkey), had been there before the Greeks settled in these regions. – Further, of course, Phoinix occurs as a personal name (e.g. the old friend of Achilles). (Athena Phoinike in Corinth is late, Lyc. 658 + schol.)

The second point is that peoples' names with the typical (non-IE) suffix *-īk-* are found in northwestern Greece, the *Aithīkes* and the *Temmīkes*. Chantraine Dict. s.v. 1. and 2. φοῖνιξ makes distinctions which I cannot accept. Thus he suggests that *Aithīk-* may contain the IE word for 'face', **-h_3k^w-*, but this would have given *p*, not *k*. Further, it is based on an interpretation of *Aithiops* which I consider wrong (see Beekes 1995/6, where I have shown that this word is non-IE., i.e. Pre-Greek). Further, Chantraine mentions that Bonfante assumes that Phoinike in Chaonia (in Albania) may be from a foreign language, perhaps Illyrian. I think that this Phoinike is not different from the other places in Greece, and must rather be a Pre-Greek form. Then he analyses *Phoinīk-* as *Phoin-īk-*. Essential is that Greek, or Indo-European, did not have a suffix *-īk-*. I agree completely with Chantraine's analysis in his Formation, 382f., where he gives a number of these words which are clearly all non-Indo-European (note βέμβιξ, πέρδιξ, σκάνδιξ, ῥᾶδιξ, σπάδιξ, κίμβιξ). After discussing forms with -ικ- and -ῡκ-, -υκ-, he concludes: "Les mots empruntés à des parlers méditerranéens mis à part, il existe de petits groupes sémantiques, peu productifs, composés de mots familiers désignant des animaux, des plantes, des termes techniques, des sobriquets ou des diminutifs. Les dérivés constitués en grec rejoignaient ainsi les noms empruntés." I doubt whether there are any words that originated in Greek, cf. my article on κῆρυξ Beekes 2003a, where I showed that the Indo-European etymology of this word must be abandoned and that it is Pre-Greek. In the introduction to this section Chantraine wrote: "A ces mots se sont associés des noms propres empruntés, Φοῖνιξ, d'où a été tiré φοῖνιξ 'pourpre'; 'dattier', etc." This treatment is rather different from that in the Dictionnaire. (Note also the different treatment by Frisk.) Thus, names of peoples like Phoinikes occur. Now Greek has an adjective φοῖνιξ 'dark red, brown-red'. Maybe the ethnonym had the same meaning; it is possible that a river (thus

Chantraine on the river near Thermopylae) has this meaning; for a mountain too it is possible (the earth containing iron?). Maybe the word had more than one meaning (cf. the meanings 'date-palm' and 'lyre, musical instrument'). Though the meaning 'dark-brown' seems quite possible for people(s), it may have had a different meaning. One reason for naming the Phoenicians thus may have been that they were the people coming along the south coast of Anatolia, always from the same direction, always rounding Lycia and entering the Aegean through the gap between Rhodes and Crete.

The only conclusion we can draw at the moment is that the name Phoinik- occurred in Greece, also in the neighbourhood of Boeotia, and that it may have been more widespread than we know; it may have facilitated the adoption of that qualification for Kadmos.

Rethinking some aspects of trade in the Arabian Gulf

D. T. Potts

Introduction

Ever since the publication of A. L. Oppenheim's seminal review of UET V (Oppenheim 1954) the dynamics of Bronze Age trade in the Arabian Gulf have been a subject of endless fascination for both archaeologists and Assyriologists. The literature on this subject has become enormous, and I am only presuming to add yet another paper to an already swelling corpus because the ongoing excavations at Tell Abraq have brought to light what is in some cases unique material which, as my title suggests, calls for a reconsideration of certain ideas, both new and old, in this field. Tell Abraq (Fig. 1), a stratified mound covering c. 4ha and rising to a maximum height of 10m above the surrounding plain, is located near the coast of the United Arab Emirates in the emirate of Umm al-Qaiwain (Potts 1990a, 1991). Three seasons of excavation (1989; 1990; 1992) have revealed an apparently continuous sequence of occupation spanning the period between c. 2500 and 500 BC. While it certainly does not provide answers to all the questions which need rethinking in Gulf archaeology, it does provide a substantial amount of new data which help one to view certain problems in a new light. This essay, therefore, is inspired primarily by three years of excavation at Tell Abraq and secondarily by a consideration of the large quantity of recently excavated or published material from other sites in the Gulf region. It is concerned primarily with developments in south-eastern Arabia, ancient Magan, and only secondarily with Dilmun. Throughout the discussion, I accept the identification of the Oman peninsula with the land known in cuneiform sources as Magan (for further elaboration, see Potts 1990b: 133–50). Where absolute dates are given for the reigns of Mesopotamian rulers I follow J. A. Brinkman's chronology (Brinkman 1977).

Mesopotamia and Magan in the third millennium BC

> Magan, and perhaps even Meluḫḫa in the third millennium BC, received large amounts of barley from Mesopotamia . . . . despite Oman's own agricultural economy, third millennium Oman/Magan's grain production may not have been fully adequate to support the large numbers of workmen and artisans engaged in the copper-mining industry . . . . Southern Mesopotamia exported far more grain to Magan as return-cargo than has previously been realized.

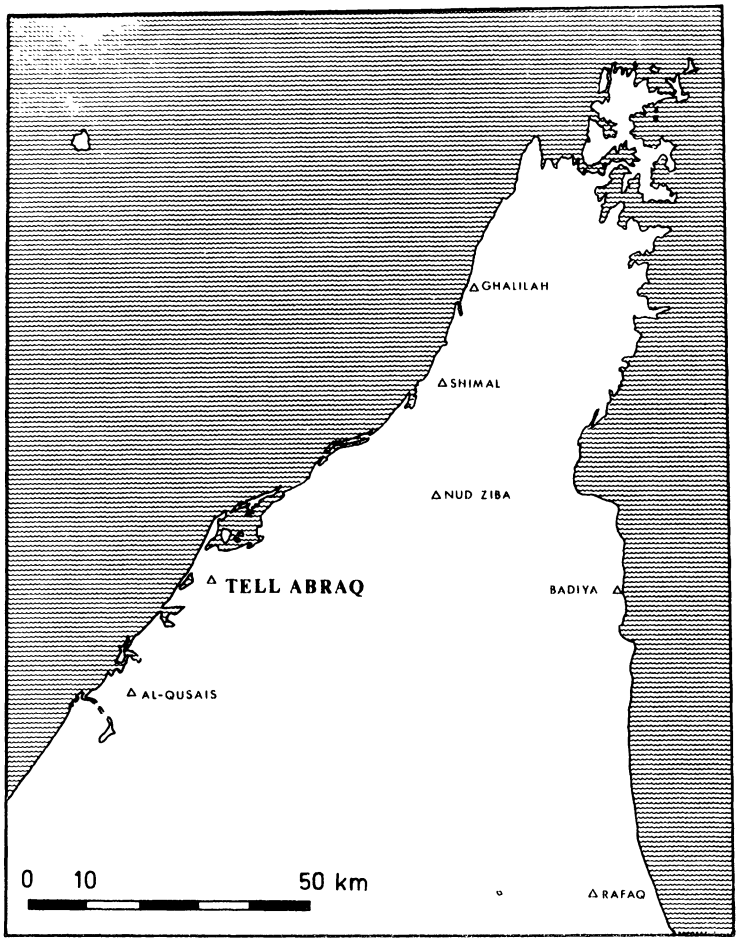

Figure 1 Map of Northern Emirates showing the location of Tell Abraq.

The author of the statement quoted above has followed a suggestion made some years ago by the eminent Assyriologist W. F. Leemans (Leemans and Kroll 1984: 25), who proposed that the large stocks of cereals generated by the agriculturally-based estates of southern Mesopotamia could have been used to pay for the regular import of foreign commodities such as copper. A similar suggestion has been made with reference to the acquisition of imports from the Iranian plateau (cf. Crawford 1973; Kohl 1978). What evidence is there that this took place?

No pre-Sargonic or Sargonic royal inscriptions or economic texts record any such movement of cereals between southern Mesopotamia and Magan, nor do any texts from the period of Gudea. There is, in fact, but one solitary text (ITT ii 776) from Tello (ancient Girsu) which is even vaguely relevant to the argument. In the year Šu-Sin 8 (2030 BC) the *ensi* of Girsu issued a consignment of 70 (or 600, the number is unclear, cf. Steinkeller 1982: 249, n. 40) bushels (**gur**) of barley to one B/Pudu (Heimpel 1987: 81, §48). This was qualified in Sumerian as **gú Má-gan^{ki} – šè**, which may be translated as 'cargo for Magan'.

This content downloaded from 128.148.231.34 on Tue, 30 Oct 2018 13:58:48 UTC
All use subject to https://about.jstor.org/terms

Nothing in this text compels us to see it in connection with the purchase of copper, however. In contrast, a slightly later text from Ur (UET III 1689) dating to the year Ibbi-Sin 4 (2025 BC), concerning the well-known merchant Lu-enlilla, explicitly notes that the goods which he received from the Nanna temple were **níğ-šám-ma urudu-Mágan**^{ki}, or 'goods issued for the purchase of Magan copper' (Heimpel 1987: 81, §46). Lu-enlilla, however, was never issued cereals for the purchase of copper. Rather, he paid for his purchases with textiles and wool, both abundantly produced by the gigantic textile 'factories' of southern Mesopotamia during the Ur III period (cf. Waetzoldt 1972). So much for the large-scale export of grain to Magan in the third millennium.

There is, however, another way of evaluating this hypothesis which its advocates have overlooked. By now, the excavation of numerous third millennium burials in the Oman peninsula has yielded the remains of hundreds of prehistoric Maganites. Dental anthropological studies, in particular, reveal a good deal about the diet of these people. If the kind of massive export of grain to the Oman peninsula envisaged by Leemans and During Caspers ever occurred, it would be recognizable in the acquired characteristics of the ancient population's teeth. K. Højgaard's investigations of the teeth recovered from third millennium (Umm an-Nar period) graves on Umm an-Nar island, located on the coast of the United Arab Emirates near Abu Dhabi (1980: 363, cf. 1984: 202) and in the Wadi Jizzi, near Sohar on the Batinah coast of Oman (1984: 202–3, 1985: 151–6), have shown that cereals played no role in the diet of these coastal populations, who were largely dependent on fish, turtle and dugong for their protein. On the other hand, cereals were at least in part responsible for the carious lesions and fractures visible on teeth from third millennium graves excavated at Jabal Hafit (Højgaard 1985: 151–5) and Maysar (Kunter 1983: 339–40) in the interior of the Oman peninsula. But the remains of cereals found, for example, at the third millennium inland settlement of Hili 8 (Cleuziou and Costantini 1980; Cleuziou 1989: 79–80), where wild wheat, wild barley, domesticated two-row barley, six-row hulled barley, emmer and sorghum are present, along with the date-palm (Potts 1990b: 130), show clearly that the interior of the Oman peninsula possessed a varied agricultural regime. This point, combined with the absence of any strong Mesopotamian influence in the third millennium assemblages of south-eastern Arabia and the lack of cuneiform references to grain export, suggests that the putative mass export of Mesopotamian cereals to Magan is illusory. The arguments raised against P. L. Kohl's suggestion that surplus grain was being exported *en masse* from Mesopotamia to the Iranian plateau in the third millennium (Potts 1982: 40–1; Carter 1990: 94) are just as appropriate in the case of alleged cereal exports from Mesopotamia to Magan.

What certainly did reach Magan, judging by the typical Early Dynastic III storage jars found in five of the third millennium burials on Umm an-Nar island (Frifelt 1991: figs 86–90, 125–8, 137, 179–81, 207), was something liquid. Provenience studies have demonstrated that the vessels analysed were actually manufactured in southern Mesopotamia (Mynors 1983). In this regard, it is interesting to recall that, in the second year of the reign of Ibbi-Sin (2027 BC), the text UET III 1511 informs us that Lu-enlilla was given, among other things, 6 **kúr** or 1515.6 litres of good sesame oil with which to purchase copper, and that the oil was on board a ship bound for Magan (Potts 1990b: 145). Several hundred years earlier, oil may likewise have travelled to Magan in the large, pear-shaped Mesopotamian storage jars found by the Danish expedition on Umm an-Nar.

Magan and the Indus Valley in the late third millennium BC

> In historical perspective, it is worth stressing that during the critical phase of intense political confrontation between the Akkadian empire and the southern states of 2300–2200 BC, Oman was still culturally close to the Iranian east and included in the great Euphratic circuit of exchange. Only after the collapse of the Akkadian empire . . . do Harappan artefacts begin to be found.
>
> (Cleuziou and Tosi 1989: 43)

How tenable is this view?

To attempt to distinguish archaeologically an Old Akkadian context of 2300–2200 from an immediately post-Akkadian context of 2200–2000 BC in the Oman peninsula is probably unwise if not impossible. Both calendric dates would be classified as 'late Umm an-Nar period' by most scholars working in the area. This is not to deny the fact that, in historical terms, contemporaneity with the Old Akkadian period as opposed to the Ur III empire is an important distinction. In reflecting on whether the Harappan penetration of the Arabian Gulf began before or after the collapse of the Akkadian empire, one is immediately reminded of Sargon of Agade's boast that ships from Dilmun, Magan and Meluḫḫa moored at the quay of Agade (Gelb and Kienast 1990), suggesting that, if Meluḫḫan (= Harappan) ships reached Babylonia by the early Akkadian period, they are likely to have been visiting the coast of Magan at that time as well.

Confirmation of some form of contact between the Indus Valley and the Oman peninsula during the late Old Akkadian period is provided now by Tell Abraq, where two Harappan weights (Plate 1) weighing 14.20 and 53.95g respectively, and a quantity of unpainted sherds from one or more storage jars, made of a very hard-fired, finely levigated, orange paste which are almost certainly Harappan (Fig. 2), have been recovered in a fireplace located within a large, circular fortress-tower (I owe both the reconstruction of the vessel illustrated and the identification of this pottery as probably Harappan to Prof. Rita P. Wright, New York University, the ceramicist of the American expedition which has been excavating Harappa since 1986). Thus far, the earliest date (K-5582) from the fortress-tower is 2570–2510 cal. BC (± 1σ 2860–2460 cal. BC), and this probably signals the period in which the building was constructed. A corrected C14 date (K-5578) of

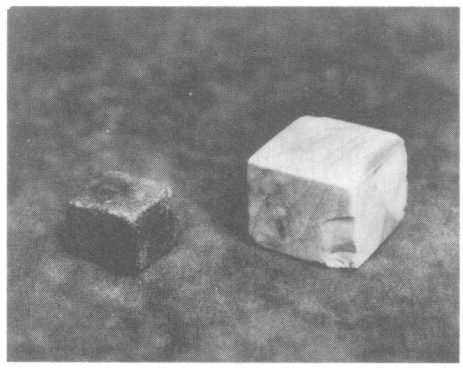

Plate 1 Harappan weights from Tell Abraq; left, TA 125 (14.20g, made of jasper (?), and right, TA 146 (53.95g), made of highly polished, banded chert.

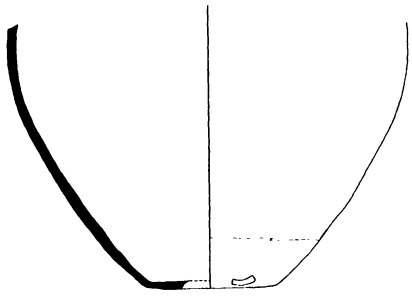

Figure 2 Reconstructed profile of TA 1811; very hard-fired red-orange, orange and cream wash; no visible temper; base diameter 12cm.

2170–2140 cal. BC (± 1σ 2280–2030 cal. BC) run on carbonized date stones has been obtained from the fireplace within which the weights and sherds just mentioned were found. From just outside the fireplace we have three more dates which all fall within the 2190–2140 cal. BC range. If we work on the basis of the calibrated dates, we are looking at a context that would be contemporary with the end of the Akkadian period (Brinkman 1977: 336). However, the weights were found in the fireplace as 'discards', and thus it is logical to assume that their use predates the C14 date by some years. This could easily push the date of their period of use back into the middle of the Old Akkadian period if not earlier. There seems, then, no justification for the view that Harappan contact with south-eastern Arabia was an exclusively post-Akkadian phenomenon.

The presence of Harappan storage jars at Tell Abraq is also intriguing. It is obvious that unpainted storage jar sherds are more likely to go unnoticed than the characteristic and more immediately recognizable black-painted Harappan pottery found at other sites in south-eastern Arabia (e.g. at Ras al-Junayz by the Joint Hadd Expedition). Once identified, however, the question arises what was being transported. While R. P. Wright has expressed some uncertainty as to whether the remains of Harappan vessels found on sites in the Gulf were imported for their innate value as ceramic containers or for their contents (Wright 1991: 72), P. Gouin has recently suggested that secondary dairy products, such as dried cheese (*qurut*) may have been travelling in jars of this sort to the Oman peninsula (Gouin 1990: 49). This is an interesting suggestion which could perhaps be confirmed by residue analysis. Was Harappan cheese a novelty to the Arabian palate which was so valuable that it was decanted and weighed using the Harappan weights recovered in the same context?

Mesopotamia and Magan in the second millennium BC

> After the collapse of the Dynasty of Ur, Telmun replaces Makkan in the Eastern trade of the city. The latter country is not mentioned any more . . . in our volume of tablets [UET V] of the Larsa Period . . . Telmun, as against Makkan, seems never to have completely lost contact with Mesopotamia.
>
> (Oppenheim 1954: 15)

. . . the modalities of copper trade became different. The Makkan boats were no longer

> reaching the ports of Sumer, and everything seems at that time to have been in the hands of Dilmun merchants . . . We do not know if restricted oasis life continued, but 20 years of archaeological research have failed to locate anything before the second quarter of the first millennium BC, when the introduction of underground water systems from Iran again made oasis agriculture a valuable alternative economic pattern.
>
> (Cleuziou 1981: 292)

The above quotations typify a number of perceptions which are widely held and in need of some modification. To simplify the analysis of these views, it is best to enumerate the points embedded in them one by one.

1. Magan is not mentioned in cuneiform sources after the Ur III period.
2. Magan continued, however, to supply the copper being retailed by Dilmun during the Isin-Larsa and early Old Babylonian eras, even though it was not mentioned as such in the cuneiform sources.
3. Settled life in the Oman peninsula, i.e. Magan, ceased c. 1700 BC, roughly at the time when Dilmun stopped supplying copper to Babylonia, and did not resume until the early Iron Age.

That Magan is not mentioned in post-Ur III cuneiform sources until the time of Tukulti-Ninurta I (1243–1207 BC; for the texts, see Grayson 1987: 237ff.) is well known, and no evidence, from Ur or any other site, has been discovered in the past four decades which invalidates Oppenheim's general point. It was purely coincidental, however, that the 'first' second-millennium assemblages discovered in the Oman peninsula dated to the early second millennium (Potts 1990b: 232–4), and that, as Cleuziou noted above, twenty years of searching failed to find anything which filled the gap between the Wadi Suq period, then put at c. 2000–1700 BC, and the Iron Age. This state of affairs fully justified his characterization of the people of the Wadi Suq period as 'the last known sedentary culture before the transition of eastern Arabia to full time nomadism' (Cleuziou 1981: 279), and indeed inspired C. Edens to add fuel to the fire by characterizing this interval as 'a thousand years of negative evidence' (Edens 1986: 204). But the coincidence between the cessation of Dilmun's role as Babylonia's southern supplier of copper, and the apparently short-lived nature of sedentary life in the Oman peninsula during the early second millennium, was more apparent than real. Sedentary life in the Oman peninsula did not cease altogether around the time when Dilmun stopped supplying Babylonia with copper. The 'great collapse' was an artifact of our archaeological ignorance, as excavations at both Tell Abraq and Shimal have shown.

Work on the settlement at Shimal (Ras al-Khaimah), which began in 1985 (excavations of graves there, discovered in 1968, had already begun in 1976–7), revealed a sedentary, coastal community which dated to the middle (c. 1600–1400 BC) of the second millennium (Velde 1991; Méry 1991; Potts 1989: 711–12; cf. Vogt and Franke-Vogt 1987: 34–6 for the similar dating of tomb SH 102). At Tell Abraq, on the other hand, we have a continuous sequence of sedentary occupation extending from the middle of the third millennium through the middle of the first millennium BC (Potts 1990a; 1991). The monumental fortification of late third-millennium date currently under excavation (for preliminary accounts, see Potts 1990a: 22–52; 1991: 21–5; note that excavations in 1992 confirmed that

what had previously been considered two buildings are in fact two phases of one and the same building) was refurbished in the early second millennium, showing no signs of abandonment. Ceramically, we can distinguish three phases within the pre-Iron Age second millennium, i.e. the period c. 2000–1200 BC (Potts 1990a: 60–77; Velde 1992).

From the newly discovered second-millennium assemblages at Tell Abraq come a number of sherds which, by virtue both of their shape and paste, are clearly foreign. I have divided these into sherds which can be parallelled largely in the Isin-Larsa and Old Babylonian period (Fig. 3 and Table 1), and those which are more at home in the Kassite and post-Kassite era (Fig. 4 and Table 2; see also the discussion of Elamite parallels below). Their presence stands in stark contrast to the impression given by the cuneiform sources in which Magan seems to do a disappearing act between the demise of the Third Dynasty of Ur (c. 2000 BC) and the reign of Tukulti-Ninurta I in the second half of the thirteenth century BC, and suggests that indeed there was some contact between the upper

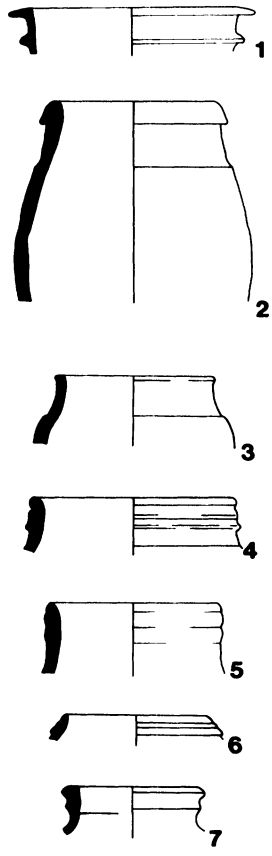

Figure 3 Mesopotamian forms, largely of the earlier second millennium BC, from Tell Abraq (cf. Table 1).

and lower Gulf during the second millennium. This suggests that Cleuziou and Tosi's characterization of the second-millennium Wadi Suq culture as 'an Omani entity selectively trading with two different neighbours: the powerful territorially integrated Indus Civilization seeking raw materials for its own consumption to the east and the mercantile centres of Dilmun to the west' (Cleuziou and Tosi 1989: 42) is far too restrictive. Indeed, even before the discovery of second-millennium Mesopotamian pottery at Tell Abraq, Wadi Suq soft-stone (*série tardive*) of Omani origin had been found in Old Babylonian contexts at both Ur and al-ᶜUbaid (Potts 1990b: 252 with refs).

Most of the sherds illustrated in Figures 3 and 4 are easily distinguished from local products because of their foreign paste and shape, but there are several sherds from Tell Abraq of obviously local paste which, however, show a characteristically Babylonian shape (e.g. Figs 3.7; 4.1, 4–7, 10, 13). This introduces a measure of acculturation into the discussion which had never previously been observed. When Babylonian vessels appeared at Tell Abraq they must have been striking enough to have induced the indigenous potters, at least on occasion, to copy them.

The subject of the southern Gulf's contact with the north in the second millennium is, however, far more complex than the simple sketch given above. Without doubt, some of the Isin-Larsa, Old Babylonian or Kassite types may in fact have originated in some part of Dilmun, for some of the same forms and fabrics are attested on Failaka (Kuwait), Bahrain, in the Dhahran tomb field (Eastern Province of Saudi Arabia) and on the north-east coast of Qatar. On the other hand, some of what appears to be Kassite pottery may in fact be Middle Elamite. It is obviously of as much interest to know to what extent Magan sustained relations with Dilmun and Elam, as it is to chart her relations with Babylonia. These are questions to which I will now turn.

Dilmun and Magan in the second millennium BC

As noted above, it has generally been assumed that the copper sold by Dilmun to Babylonian merchants in the early second millennium BC must have originated in Magan. When S. Cleuziou reviewed the archaeological evidence of contact between Dilmun and Magan in the second millennium, however, he was forced to conclude that it was 'rather weak' (Cleuziou 1986: 152). If we consider 'greater Dilmun', i.e. Failaka and eastern Saudi Arabia, as well as Bahrain, we can add a few more items to the list put together by Cleuziou.

Socketed spearheads comparable to Wadi Suq examples have been found on Bahrain at 'Ali, Diraz (Cleuziou 1986: 150), Al Hajjar (Lombard and Kervran 1989: 29, §42), Barbar temple II (Glob 1958: fig. 12b) and Saar (Killick et al. 1991: fig. 16.1), as well as in a grave west of Jabal Makhruq (south-west of the Yabrin oasis) in eastern Saudi Arabia (Bibby 1973: fig. 57). The northward spread of second-millennium, Wadi Suq-type soft-stone, discussed above with reference to Ur and al-ᶜUbaid, encompassed Dilmun as well. In 'Dilmunite' territory this kind of soft-stone has been found on Failaka, Tarut, Bahrain and in the Dhahran tumuli (Potts 1990b: 251–2; Potts 1986: 151; exhaustively reviewed in Häser 1988: 67–99; for the two Dhahran finds, see Zarins 1989: 83; for the new finds from Saar, see Killick et al. 1991: fig. 16.2–3). Spouted vessels of Wadi Suq type were also found

This content downloaded from 128.148.231.34 on Tue, 30 Oct 2018 13:58:48 UTC
All use subject to https://about.jstor.org/terms

by the Danish expedition on Failaka (Højlund 1987: figs 154–6; Potts 1989: 710), and a painted sherd from a Wadi Suq beaker was found near the third Barbar temple on Bahrain (Potts 1990b: 248).

Of Dilmunite finds found in Magan territory, we can cite a Dilmun seal from a re-used grave at Mazyad, near Jabal Hafit in the interior of Abu Dhabi (Cleuziou 1981: fig. 8), while several sherds from the settlement at Shimal compare well with Failaka types as well (Velde 1991: fig. 17, cf. Failaka types 55A, 55C, and 56B). Moreover, as noted above, some of the generically Mesopotamian (and/or Elamite) types found in second-millennium contexts at Tell Abraq can also be paralleled in the Failaka and Qalat al-Bahrain sequences (Potts 1990a: figs 87.1, 90.6, 105.8, cf. Højlund 1987: fig 196), as can some of the local, painted wares (e.g. Potts 1990a: fig 74.14; cf. Højlund 1987: fig. 435; possibly Potts 1990a: fig. 81.2; cf. Højlund 1987: figs 55–6).

More importantly, the excavations at Tell Abraq, for the first time in the archaeology of south-eastern Arabia, have brought to light a sizeable quantity of Dilmun red-ridged pottery (Plate 2), characteristic of City II in the Bahraini sequence. Over the course of three seasons, no fewer than 298 red-ridged sherds have been identified from early second-millennium contexts (Potts 1990a: 25, table 1; 1991: 72–4; unpubl. field records). In addition, a single, scored rim fragment from a sac-shaped Dilmun burial jar (Fig. 5) has also been found. A particular kind of ridged pottery, characteristic of the middle of the second millennium at Tell Abraq, occurs as an Omani import at Khor on the coast of Qatar (Potts 1990a: fig. 80.4; cf. Edens 1981: fig. 6, middle), as pointed out to me by my Tell Abraq colleague, C. Velde.

Moreover, it now appears that a local, second-millennium stamp seal tradition existed in the Oman peninsula, inspired perhaps by Dilmun glyptic. The unique seal TA 495 (Fig. 6), found at Tell Abraq in 1990, has the general shape of a Dilmun seal, though without the raised boss and dotted double circles. It shows a striding male (god?) above a horned caprid. In shape and general conception the seal is clearly reminiscent of Dilmun glyptic, though just as clearly not a genuine product of a Dilmun stamp seal workshop. More likely than not, it was a local product, and it is tempting to suggest that the seal may have been used by someone engaged in commerce with Dilmun.

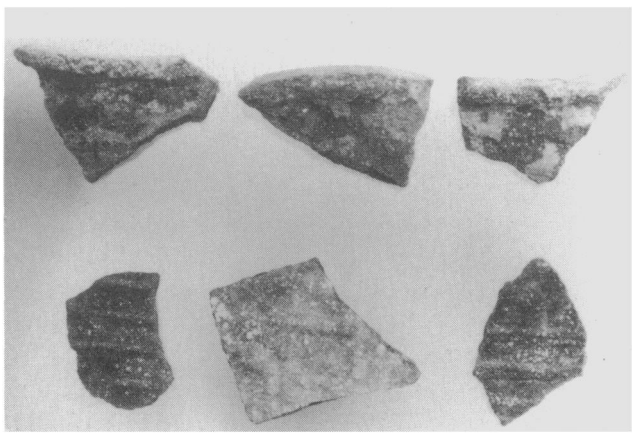

Plate 2 City II red-ridged sherds from Tell Abraq.

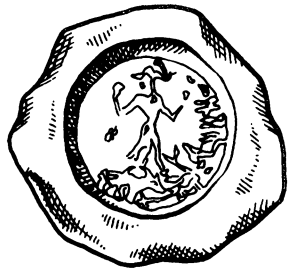
Figure 6 TA 495, a black soft-stone stamp seal, 2cm in diam., 1cm high (= Potts 1991: figs 67–8).



Elam and Magan in the second millennium BC

That Elam, broadly defined, enjoyed some form of contact with Magan during the late third millennium is unquestionably indicated by the number of *série récente* soft-stone vessels of undoubted Omani origin found at Susa and Bandar Bushire (de Miroschedji 1973: figs 8.7–9, 9.2–3; Pézard 1914: pl. VIII.4). With the benefit of twenty years of research in the Oman peninsula unavailable to P. de Miroschedji when he wrote his fundamental study of the soft-stone from Susa, it is now an easy matter to distinguish these Omani products from their Central Asian or Iranian counterparts. Several pieces of obviously second-millennium soft-stone are also known from Susa and Bandar Bushire (de Miroschedji 1973: pl. VIIe; Pézard 1914: pl. VIII.2, 5; these finds have recently been discussed by Häser 1988: 100–2), and four recently published soft-stone sherds from Haft Tepe are almost certainly of Omani origin as well (Negahban 1991: pl. 29.205).

Yet, if these finds represent the Magan imprint in Susian or Elamite territory, until very recently nothing could be claimed to represent the Susian or Elamite imprint in Magan. Three seasons of excavation at Tell Abraq have now brought to light a number of sherds (Fig. 4) which find good parallels in the Middle Elamite repertoire at sites like Susa, Tal-i Malyan and Tepe Farukhabad, as well as a faience cylinder seal (Plate 3) which shows characteristics of Middle Elamite glyptic (e.g. the use of faience, the hatched border and the tree motif) well attested at Susa and Choga Zanbil. The Middle Elamite date of this material is particularly interesting in view of the fact that at least one of the soft-stone vessel fragments of Omani origin from Bandar Bushire (Pézard 1914: pl. VIII.2) comes from a level which can be assigned to the Middle Elamite period on the basis of its ceramics

This content downloaded from 128.148.231.34 on Tue, 30 Oct 2018 13:58:48 UTC
All use subject to https://about.jstor.org/terms

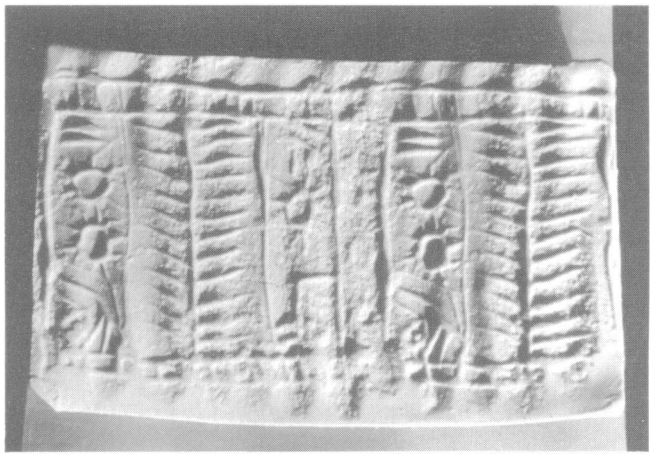


Plate 3 Impression of TA 12, a faience cylinder seal, 4.1cm long, 1.2cm in diam.

(Häser 1988: 100), while one of the Susa pieces (de Miroshedji 1973: pl. VIIe) comes from the foundation deposit of the Inšušinak temple which was probably buried in conjunction with one of the Middle Elamite restorations of the building (Häser 1988: 101; cf. Carter and Stolper 1984: 37, 157).

Just as we have some difficulty distinguishing the Kassite from the Middle Elamite ceramic parallels at Tell Abraq, so too is it impossible at this point to determine how the chronological position of the Middle Elamite items at the site relates to the changing history of Kassite–Elamite political relations during the second half of the second millennium. Conversely, it would be interesting to know whether the appearance of Omani soft-stone on Middle Elamite sites reflects a sequence of political or economic changes in Elam's relationship with Magan or can be explained by the more mundane vagaries of travelling individuals who reached sites like Bandar Bushire, Susa and Haft Tepe with a few stone bowls in hand. Did the growth of ties between Magan and the Middle Elamite state post-date the documented presence of Kassite governorship in Dilmun (Potts 1990b: 307–14)? Did the powerful Middle Elamite state forge an alliance with Magan which impacted upon the Kassite presence in Dilmun? Did it have anything to do with the decline of Kassite influence in the region? What relation, if any, did these developments have to Tukulti-Ninurta I's defeat of the Kassites in southern Babylonia? Are the ceramic, soft-stone and glyptic parallels between sites in Susiana and the Oman peninsula noted above 'fall-out' from a hitherto unsuspected trade in copper between Magan and Elam?

Finally, on a more mundane, archaeological level, the presence of Kassite and Middle Elamite types in late Wadi Suq period contexts at Tell Abraq has implications for the date of the beginning of the Iron Age in south-eastern Arabia, currently placed around 1350/1300 BC by Boucharlat and Lombard (1991: table 4). Finds which would be paralleled in Susiana in the thirteenth or even twelfth century, yet which come from pre-Iron Age, late Wadi Suq deposits at Tell Abraq, suggest that the date of the beginning of the Iron Age in the Oman peninsula may need to be lowered.

Conclusion

> [By the time of Sennacherib] it becomes evident that Telmun has again access to the copper mines of Makkan, to the spices, perfumes and rare woods of the East. The merchants are importing again these staples into Mesopotamia: the mysterious barrier which interrupted the trade routes towards the East for a full millennium seems to have been removed. What movements of nations, changes of military and political power or technological developments had been at work to first restrict the Eastern horizon of Southern Mesopotamia and to open it again – we will probably never know.
>
> (Oppenheim 1954: 17)

Three seasons of excavation at Tell Abraq have brought to light unexpected material which calls into question some of the conventional wisdom of Gulf archaeology, as well as some of the newer hypotheses put forward by scholars working in the region today. Perhaps more than anything else, the material discussed above demonstrates that there were more connections spanning a greater period of time between Magan and Dilmun, Magan and Elam, and Magan and Mesopotamia, than ever before imagined. The silence of the cuneiform sources and the apparent interruptions in contact no longer seem quite so unequivocal. There is evidence for contact between Magan and her northern neighbours from the early third millennium, when the Hafit graves containing Jamdat Nasr-type and Early Dynastic jars occur (Potts 1986: figs 1–5), through the second millennium BC, and although it may appear at times as if there are gaps of several centuries here and there for which we have no evidence, the example of Tell Abraq should warn us that the excavation of a single site can dramatically alter that perception by providing new material which fills those gaps. Absence of evidence, as we are often told, is not evidence of absence. In short, the resumption of Mesopotamian contact with the east to which Oppenheim referred in the passage quoted above was no resumption at all. The cuneiform sources may have been silent on the subject of Magan over the preceding millennium but the sherds, stone vessels and glyptic remains leave no doubt that contacts between Mesopotamia and Magan must have persisted, even if they went unmentioned in the written record.

Nor does the thread of continuity in contacts between Magan and her northern neighbours reach an end at the close of the second millennium. In the seventh century BC Pade, king of Qade, whose capital was at Izki in Oman, brought tribute to the court of

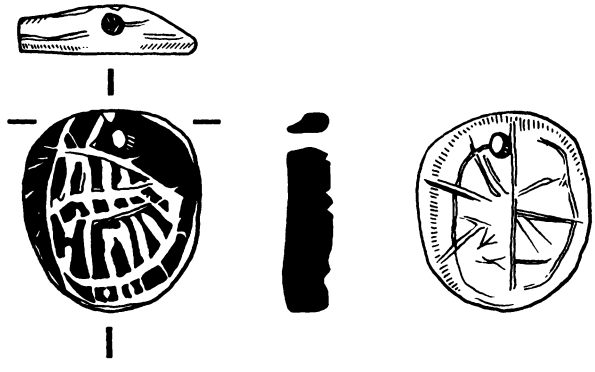

Figure 7 TA 493, a grey soft-stone pendant measuring 1.6 × 2.3 × 0.6cm (= Potts 1991: figs 142–3).

Assurbanipal at Nineveh (Potts 1990b: 393). Later, when Magan (Old Persian Maka, Elamite *Makkaš*) was a satrapy of the Achaemenid empire, messengers travelled between Persepolis and Oman, maintaining the ties which had long linked Magan with Elam (Potts 1990b: 395–7). Maganites, whom Herodotus calls *Mykoi*, fought with Xerxes at Doriscus in 480 BC (Potts 1990b: 398). A unique Iron Age pendant (Fig. 7) from Tell Abraq, which shows what is almost certainly a sewn reed boat, may well represent the sort of seacraft which must have been used in forging those links between Magan, Babylonia, Elam, Dilmun and the Indus Valley, which have been the subject of this essay.

Abstract

Potts, D. T.

Rethinking some aspects of trade in the Arabian Gulf

Recent excavations at Tell Abraq in the United Arab Emirates have brought to light material dating to the third, second and first millennium BC which calls into question certain long-held views in the archaeology of the Gulf region, as well as some more recently published hypotheses. Using the material from Tell Abraq, a number of problems specifically related to trade between the Oman peninsula (ancient Magan) and her neighbours are discussed. The emerging picture is one of much greater continuity in Magan's external relations than had previously been thought.

PHOENICIANS

Susan Frankenstein

THE PHOENICIANS IN THE FAR WEST: A FUNCTION OF NEO-ASSYRIAN IMPERIALISM

Existing interpretations of the role of the Phoenicians in the history of the Near East have tended to stress their specialist functions in trade and navigation within the framework of a mercantile economy. This picture stresses the structural similarities of the Phoenician city states of the 1st millenium BC and the European trading cities of the 16th century, i.e. a similar emphasis on the dominance of a merchant class forming an oligarchic elite; a similar reluctance to be incorporated into larger political entities that would limit freedom to trade; and a fear that the 'gaining of commercial profit' would be made secondary to the provisioning of the economic needs of the 'state'.

Whilst a recognition of these similarities is potentially relevant to the study of the Phoenician cities, the significant differences between the two situations must be noted. Firstly, unlike the 16th century European cities, the Phoenician cities developed subsequent to and were always dependent upon the existence of larger territorial states or empires for their existence. The role the Phoenician cities played was therefore always an interstitial one which was, in a sense, parasitical to the demands of the major empires that have dominated the history of the Near East. Secondly, whilst it has been argued that the driving force behind the Phoenician expansion lay in their need to meet the tribute demands of these large empires, this has led to a view of their economic role as one of sustaining a dominant empire in a passive sense. This implies that the functioning of the Phoenician cities can be reduced to a response to external constraints imposed by a more dominant political entity in a type of vassalage relationship.

In this paper,[1] it will be argued that it is necessary to recognise the Phoenicians as playing a more decisive role in supplying goods and services to neighbouring empires. Goods and services that the latter could not obtain by other means, or at least only by greatly increased costs in military expansion and/or economic reorganisation. It can therefore be suggested that the Phoenician cities, and their Canaanite precursors, played an essential role in the maintenance and development of 'empires' in the Near East: a degree of importance that can be discerned in the differential treatment often given particular Phoenician cities by their political masters.

The main part of this paper will be concerned with exploring this

hypothesis with particular reference to the relationship between the Phoenician cities and the Neo-Assyrian empire in the 8th and 7th centuries BC, the period of their expansionist strategies in the Central and Western Mediterranean; the effects of these strategies will then be examined in the case of Iberia. However, it must first be shown that certain salient features of the political economy of the Phoenician cities of the 1st millenium were already dominant features of the Canaanite cities of the 2nd millennium and that their functioning had clearly become a well evolved pattern in the regional economy of the Eastern Mediterranean.

The late 2nd millennium background

By the late 2nd millennium, the contents of the El Amarna letters and the evidence from Ugarit show that the Levantine coastal cities had come to occupy a key role in the Egyptian dominated trading network. Trading connections between Egypt and the Levant coast go back to the Old Kingdom (2700-2000 BC) when Byblos, in particular, supplied Egypt with wood, gums and oils, and indirectly seems to have maintained connections with other areas beyond the Syrian coast. By the 16th century BC Canaanite cities had come to occupy a pivotal position in a complex regional economy, linking Southern Anatolia, Cyprus, Syria, Egypt and the Aegean, in which they can be seen to have developed specialist functions as navigators and producers of luxury commodities on which their more powerful neighbouring states became dependent. Through their involvement in this regional exchange system and their support (most of the time) of Egyptian pre-eminence, the coastal cities were encouraged to organise their economic activities increasingly along the following lines. Firstly, the production of luxury commodities, such as fine ivory inlaid furniture, for royal consumption. Secondly, the production of certain commodities, such as cloth, dyes, garments, was developed on a sufficiently large scale for their use in tribute payment and in exchanges for raw materials. Thirdly, navigational skills were developed as well as the ships needed both for carrying these bulk commodities and to ensure independent access to raw materials. These were both used to produce luxury commodities in their own workshops and also for export.

The organisation of trading ventures from the Canaanite towns was in the hands of mercantile 'companies' or 'firms' known to have operated there – and in Ugarit – and as mentioned in the account of Wen-Amon's expedition in the 11th century. Maisler cites the reference to the 50 ships at Sidon which stood in 'Hbr' with 'Wrktr', who was 'probably the head of a great trading company', as evidence for the early date of these commercial firms whose function would have been to provide the capital, to build

the ships and subsequently to sponsor and protect the fleets.[2] Traders would therefore have owned their ships, paid their workforce and organised their own voyages. We know too that these traders were not under the direct control of the king but operated independently. The independence of these traders' activites is noted from Wen-Amon's account and from the 7th century treaty between Esarhaddon and Baal which dealt with the rights of the 'ships of the people of Tyre' as well as with those of its king. The political status of the traders – on whose successful activities the wealth of the city depended – is indicated in the 14th century records which refer to the 'council of elders' and the 'men of the city' as the king's advisers. The Egyptian use of the term 'Kyn'nw' in the 15th century for the 'special class of people in Syria' which Maisler believes to be the earlier representatives of the merchant elite of the Phoenician cities, is another indication of the rank of these 2nd millennium traders.

Hence by the 14th century, the Canaanite cities presented many typical features of commercial centres oriented towards production for exchange, i.e. the procuring and conversion of raw materials into higher value secondary products and the development of skills and institutions for the maintenance of commercial activities. This took place within a network of external alliances and relations to ensure favoured access to markets and freedom to trade. It seems likely that such a specialised role for the Levantine cities had already emerged in the early 2nd millennium and developed consequent to a demand for such services from earlier states, like Egypt, when trade – in the Old Kingdom – was a royal monopoly. Certainly be the late 2nd millennium, it is clear that the existence of these cities depended on the specialised work they performed for more powerful neighbouring states and the kind of relationship they had with each other depended, to a large extent, on these external ties. The relationship of the Canaanite cities to Egypt, for example, was not simply one of vassalage but was based on complex ties of tribute, mutual dependence and alliance in which cities competed for political and military support from the Egyptian pharaohs.

Whilst we are not in a position, at present, to suggest an explanation for the origin of these cities on the Levantine coast, it does seem significant that they developed to play an intermediary role for a highly centralised, theocratic state provisioning system where 'trade' existed as a royal monopoly and prevented independent mercantile accumulation. The inflexibility of the Egyptian ancient economy, as far as its relations with its outside world is concerned, has been noted by Ekholm and Friedman in this volume, together with the fact that it depended on that external area for many vital products, many of which came from areas dominated by the competitive, commercial city states of Mesopotamia

and North Syria. We can suggest, therefore, that at least in the 2nd millennium, and possibly earlier, the Levantine cities acted as the means by which Egypt, as a self-regulating territorial state where accumulation processes were heavily centralised, could mediate with external trading partners, in particular Mesopotamia, to gain necessary raw materials and manufactured products without having to expose its internal order to the disruptive tendencies of mercantile accumulation.

Although the relations between Levantine cities were competitive, there is good evidence for contractual arrangements of mutual benefit. The rulers of the cities were obviously concerned to maintain access to each others' ports and resources as well as to obtain goods for further exchange. Resident merchants were able to participate in exchange within and between cities and the commercial network of each city was linked into that of others. The bases of this cooperation and interdependence were in turn safeguarded by contracts and agreements between the families of rulers and between those of their representatives.

The regional configuration at the end of the 2nd millennium

From the 11th century we have interesting evidence for the emergence of a new regional configuration for commercial opportunity in the Levant. A new phase of relations between Byblos and Egypt is recognisable in the account of Wen-Amon's voyage to the Levant.

The account of his voyage is significant since he was only one of a series of emissaries sent by Thebes to re-establish commercial relations with the Phoenician cities. As gifts from the Delta, the king of Byblos received the type of goods the Phoenicians later came to produce themselves, but anything Wen-Amon required was only to be supplied on the basis of strict equivalence of exchange. Given the relative unimportance that a city like Byblos attached to a mission by a representative of its former major trade outlet and political master, the implication we must draw is that a new regional configuration for commercial opportunity had developed by this period.

It is therefore no coincidence that at this time, when the economic power of the Phoenician cities was growing, we see the foundation of the Aramaean states in North Syria and the first major expansion of Assyria, known from a document from Assur recounting the first western venture of Tiglath-pileser I:

> 'I went to the Lebanon (Lab-na-a-ni). I cut (there) timber of cedars for the temple of Anu and Adad, the great gods, my lords, and carried (them to Ashur). I conquered the entire country of Amurru. I received tribute from Byblos (Gu-bal), Sidon (Si-du-ni), and Arvad (Ar-ma-da). I crossed over in ships (belonging) to Arvad, from Arvad which is on the seashore, to the town Samuri which (lies) in Amurru (a distance of) 3 double-miles overland. I killed a narwhal which they call "sea-horse" on high sea'.[3]

On his journey to the western land, not only does Tiglath-pileser receive 'tribute', but he is clearly fêted by the cities of Syria and in particular Phoenicia. This should not be regarded as a campaign of military conquest. It is important to note the contrasting attitudes of the Phoenician cities to the representative of Amon, on the one hand, and the representative of Assur, on the other. This is clearly visible in the demands for equivalent payments from the Egyptians and the offering of gifts, hospitality and even timber – the Phoenicians' most valued asset – to the Neo-Assyrian king. The ascendance of Assyria – although interrupted for c. 75 years – was utilised from the start by the Phoenician cities. This served to demonstrate the desirability of strong economic ties with a major power, even if politically it appears to involve ties of dependence on the part of the Phoenician cities.

Within this new regional system, increasingly dominated by Assyria, an initial phase of alliance between Phoenician cities and their immediate hinterland in the 10th century is known from references in the Old Testament to the relations between the first kings of Israel and Hiram I of Tyre. The expansion of the Israelite kingdom as far as the Euphrates was accomplished by David and consolidated by Solomon. Thus, a close alliance with Israel ensured the Phoenician cities access to inland trade routes – to Anatolia, Mesopotamia, Syria, Arabia and Aqabah – and maritime trade routes to the East.

Although the language of diplomacy is used to describe the relations between Tyre and Israel, the economic significance of their alliance cannot be camouflaged. Essentially, the basis of the alliance was an exchange of technology, services, natural resources and manufactured commodities. Tyre exported technology and skilled craftsmen as well as commodities in which skilled labour or some manufacturing processes had been invested. Israel provided foodstuffs, natural resources and the vital access to allies and dependents. The economic expansion of the Phoenician cities was only possible through political alliances such as this which had to be reinforced by exchanges of gifts and services and confirmed by intermarriage: thus, Hiram's daughter was one of Solomon's 'Sidonian' wives.

The alliance between Tyre and Israel represented the linking up of a maritime and a territorial power. The relevance of the development of contractual relations between the rulers of Israel and Tyre is that they would

have encouraged similar contractual relations between partners of lower rank. This would explain the occurence of Phoenician wares in Israelite settlements and trading posts of the 10th and 9th centuries. The alliance with Israel opened the trade routes beyond the Euphrates to the Phoenicians and the Eastern maritime routes were opened for joint Israelite/Phoenician ventures.

In the city of Tyre, the profits of successful commercial enterprise were 'reinvested': the city was enlarged and embellished, the port and market place extended, temples rebuilt and adorned and a palace built. The development of the fishing, weaving and dyeing industries and of the workshops for bronze and ivory are associated with this period. The presence of Danites and Gebalites among the Tyrian workforce suggests an expansion of these manufacturing industries associated with the construction projects. A crucial phase in the process of urbanisation and commercialisation of Tyre is found in the following features: the contraction of the population within the city limits; the centralisation of manufacturing activities; the break in the city's dependence on its immediate hinterland (and hence on a dependent rural population); and a greater dependence on imports of basic foodstuffs and raw materials obtained in exchange for manufactured commodities and services. It would appear that territorial expansion – particularly inland – would have had the effect of draining rather than supplementing Tyre's resources. This is the implication of Hiram's rejection of Solomon's offer of '20 Galileen cities' (Kings IX, 11). In fact, this reluctance to control land can be regarded as a characteristic feature of the commercial city state since land, in itself, does not necessarily contribute to production for exchange and it may be cheaper to import foodstuffs in exchange for manufactured items.

Within the regional trading system, both before and after the division of the kingdom of Israel, the Phoenician cities were involved in both the distribution of Egyptian luxury commodities and in the manufacture of other, often Egyptianising, wares. Increasingly, the Phoenician cities came to specialise in the production of luxury goods, i.e. the 'merchandise' that 'enriched the kings of the earth' (Ezekiel XXVII, 33), which are found on the major 9th century settlements in the Near East. This merchandise would have included 'fine linen, dyed and embroidered cloth, tapestries, carpets, glass and faience bowls, vessels of bronze, silver and other sorts of metal-work, wines, musical instruments, incense, spices, foods and seeds'.[4] Similarly, Phoenician tribute recorded on the inscription of Ashurnasirpal consisted of imported commodities or items manufactured in Phoenician workshops from imported raw materials.

The Neo-Assyrian dominated regional economy of the early 1st millennium

The 9th century Western Asiatic regional trading system, in which the Phoenician city states functioned at first as the purveyors of the merchandise described above, extended from Northwest Iran and the Persian Gulf to Central Anatolia and the Eastern Mediterranean. It came to be dominated, both economically and politically, by the Neo-Assyrian state.

It was over this formerly economically integrated area that the Assyrian state rapidly extended political control, converting local relations of economic dependence and exchange to political relations of subordination and provision of tribute. However, whilst the relations of conquered cities to Assyria were ideologically represented in terms of submission and tribute, it is unclear to what extent the empire formation represented a real reorganisation of economic functions rather than it facilitated, if not extended, traditional exchange relations and regional specialisations. That the provinces seem to have retained a measure of economic self-sufficiency and freedom to accumulate wealth in traditional ways as long as the tribute demands were met, is reflected in the 'almost inevitable rebellion'[5] that greeted each Assyrian king on his accession. This, in turn, supports the idea that control over the inter-regional trading network was an important motive behind Assyrian imperialism. Levine, for example, has related the decline of Assyria between 824 and 744 to the control by Urartu of the Eastern trade routes.[6] During the 9th and 8th centuries the power of Elam rivalled that of Assyria and Urartu's connections with Elam are recognised in the transmission of Elamite products and cultural elements westwards at this time. An alliance between the kingdom of Urartu and the North Syrian states enabled Urartu to control trade to the west, to the Aegean, and to the north through Cilicia and Central Anatolia to the Black Sea. Irene Winter has contributed significantly to the definition of this trading sphere, as illustrated by her distribution map of Syrian ivories of the 9th century.[7]

The commercial basis of the Assyrian economy has been discussed by Oppenheim,[8] who distinguished between the structure of the Mesopotamian city-state economy based on credit transaction, capital investment and usury, in support of a storage economy, and contrasted it with the 'goods in kind' type of exchange in which profit is made through turnover which, he says, characterised the economies of the western states. Elsewhere, Oppenheim refers to the economic structure of Mesopotamia as an inevitable symbiosis between palace and trader; the former being dependent on the latter for the import of essential raw materials as well as luxury goods and the trader needing the palace for protection and international contacts.[9] These points are expanded by Diakonoff who characterises the people of

the periphery of Western Asia at the beginning of the 1st millennium BC as practising his economic sub-type Ib.[10] By this he means an in-kind economy which did not require any imports from the developed countries (eg. Babylonia) except for luxury items and where money was not used to facilitate exchange. Assyria and Babylonia, on the other hand, required raw materials, particularly timber and metals, to feed their developed agriculture and handicrafts and to sustain production for long distance trade. Perhaps more significantly, the early 1st millennium BC witnesses the expansion of a moneyed economy in Mesopotamia with the charging of interest on loans and exchange based on credit transactions constituting the means by which palace and trader interacted and trade between Mesopotamian cities was conducted. Hence, as Diakonoff notes, under the existing conditions of international trade an equivalent exchange of goods between Mesopotamia and the Western economies could not be arranged: '. . the "in-kind" households of the periphery did not need money since it could not be invested, neither did they need the produce of the developed countries, at least not in amounts equivalent to the demand on their own produce'.

As a consequence of this significant observation, Diakonoff proceeded to characterise Assyria as a 'warrior empire', imposing forcible exchange through tribute and looting as a solution to these inequalities in exchange. However, as Oppenheim has argued, this seems to ignore all the evidence for Assyrian trade in the West during the early 1st millennium and the importance of control over trade routes as significant factors dictating Assyrian foreign policy.[11] Oppenheim shows quite forcefully how '. . the very nature of the goods which the Assyrian kings called tribute showed that they were destined for trade channels'.[12] Also, tribute was clearly seen as an economic imposition in order to reorientate economic activity and trade to Assyria and hence was regarded by the Assyrians as a symbolic representation of the facilitation of long distance trade. In a letter referring to 4800 pounds of red-purple wool and 420 pounds of dark purple wool coming from the West, we have evidence for the 'commercial importation' of the same commodities as were acquired through the 'forcible exchange', ie. booty and tribute.[13] But the Assyrians refer frequently in tribute lists to 'garments made of linen with multicoloured decoration' which together with the finest Egyptian linen were of 'prestige value' in Assyria and later in Babylonia.

> 'All the conquered or threatened kingdoms from Carchemish to the Mediterranean coast had to deliver large quantities of such apparel to the Assyrian kings who distributed these obviously very fashionable "Western-style" garments among their officials, as is illustrated by a well-known letter from Sennacherib as crownprince to his father, ABL 568.'[14]

Oppenheim used the references in Ezekiel XXVII, 24 to the production of fine garments and their repute in 6th century Babylonia to suggest that Tyre and other Phoenician cities probably dominated their production. It can also be suggested that the wool and ivory paid as tribute to the Assyrian kings by Babylonian rulers would have been acquired initially from the Phoenician cities, viz. from their merchants active on the caravan routes.

From this we can draw two conclusions: firstly, tribute relations allowed and/or encouraged trade relations and created security in which trade could take place; secondly, the Phoenician cities were an area of specialisation that was given commercial advantage and protection because of their importance to Assyria.

As noted for other similar situations,[15] Assyria's external relations consisted of enforcing trade relations and the acceptance of foreign merchants as a preliminary to economic and political take-over. Both Diakonoff and Oppenheim have elucidated important aspects of this objective of Assyrian foreign policy, which was to impose control over external trading partners in order to force them to re-orientate economic activity and trade to Assyria, rather than to competing centres.

The North Syrian – Urartian alliance of the 9th and early 8th centuries implied control over access to both the eastern and western trade routes which would have severely undermined the capacity of the Assyrian economy to maintain itself. The degree of instability that this caused within Assyria is indicated by the difficulties the Assyrian rulers had in controlling their nearest provinces East of the Euphrates whilst maintaining trade to the south and east. As an example of Assyrian isolation in this period, Winter cites the loan of one mina of silver at the phenomenal interest rate of 400%, which she interprets as indicating a severe reduction in the supply of metals – and in particular silver – in Assur at this time.[16] The full economic resurgence of Assyria in the late 8th century depended essentially on the destruction of the North Syrian – Urartian alliance in the north and west. The Aramaean kingdoms of North Syria were incorporated into the Assyrian provinces west of the Euphrates following their defeat by Tiglath-pileser. Cities were destroyed and their populations moved to other provinces and the North Syrian area became a closely controlled dependency of Assyria.

Irene Winter has remarked upon the significant exemption of Carchemish from this treatment.[17] It retained a certain degree of autonomy mainly due to its strategic importance for organising Assyrian access to

the Anatolian metal trade. It is quite clear that Assyria remained aware of the threat of a resurgence of power in North Syria and acted accordingly against Carchemish when its ruler made alliances with Anatolian kingdoms.

Assyria does not appear to have extended control over Western Anatolia nor to have taken over the commercial ties established with the Greeks in the Eastern Mediterranean. Hence, by the early 7th century, the Ionian and Aegean Greeks faced a massive shift of political and economic power in the Near East which effectively left them isolated and unable to re-establish contact with the now dominant Assyrians.

It can be argued that the effect or an aim of this policy in North Syria was to revive the overland route to the independent Phoenician cities. In contrast to Israel and Judah, which were incorporated as vassals, there is evidence to show that the Assyrians, whilst attempting to control and re-direct their trade to some degree, left the Phoenician cities virtually autonomous. In one of the Nimrud letters, reference is made to Assyrian 'tax-collectors' in Tyre, but this is all we know of direct Assyrian intervention in Phoenician commercial activities at this time.[18]

With reference to tax collection, it is important to note that in Assyria by the 8th century the value of all goods was probably measured in terms of a silver standard and by the 7th century silver designated for currency was clearly distinguished from that which could be used in manufacture. It can therefore be suggested that taxes would have been levied in silver or in commodities which could easily be exchanged against it. Thus, in the case of the Phoenician cities, silver and equivalently high value commodities would have been needed to satisfy tax, tribute and trade demands of the Assyrians. If the tribute lists are indicative of the value attached to different commodities, then the high value commodities in demand in the 8th and 7th centuries included gold, silver, 'copper' and bronze vessels, ivory and fine wooden products. It is unlikely that the Assyrians would have been interested in acquiring Phoenician bulk commodities – such as plain cloth – which could more easily have been obtained from their own manufacturing centres or those of Babylonia. However, the Assyrians were able to obtain from the Phoenicians commodities which were essential for internal circulation and which could not be obtained easily from other sources. There seems little doubt therefore that this factor lies behind the particularly favoured treatment given to the Phoenician cities by their Assyrian masters.

In the early 1st millenium, Phoenician cities were involved, together with the Syrian kingdoms, in supplying the enormous quantities of iron required by the Assyrian 'war machine'.[19] They would also have acted as middlemen in the trade between Egypt and Assyria, dealing in commodities such as 'Egyptian blue' (frit), woad, alum and fine linen: these items

are generally noted as coming from 'the West' in Assyrian texts, without reference to the specific area of origin. Similarly, trade in wines, honey and spices would have been in the hands of the Phoenician merchants. But from the late 8th century, when the Syrian states were crushed, the Phoenicians became the main suppliers of primary materials to their Assyrian and other partners in the regional trading system. This represents a considerable change from their former role as suppliers of manufactured commodities for elite consumption.[19a]

In order to meet the new demands from within the regional trading system, the Phoenician cities were forced to extend their exchange relations. Maritime expeditions to India were probably excluded by the re-establishment of trade with the East by Babylon.[20] Thus, expansion beyond the regular, established trading network within the Eastern Mediterranean would have been the means by which the Phoenician cities could maintain themselves whilst maintaining their role within the Assyrian dominated regional economy. In fact, the Assyrians' demands forced the Phoenician cities to become suppliers of raw materials for the production centres of trading partners and in order to obtain these raw materials the Phoenician cities had to enlarge their trading sphere. It is significant that in order to function as procurers of raw materials the Phoenicians had to act as suppliers of manufactured goods: either their own or those that were more easily obtained within the Near East or *en route* to the new sources. The scale of production of goods for exchange had to be increased or new centres of production either established or tapped.

Phoenician trading strategies

There are many examples of the establishment of new production centres in Phoenicia for luxury items, such as faience, frit and glass objects and vessels, scarabs, alabaster and quartzite containers – often with 'garbled' Egyptianising hieroglyphic signs – and fine metalwork including jewellery. Through the extensive use of overland caravan routes as well as maritime routes by Phoenician traders, and their partners, these products reached Urartian centres like Karmir Blur, Mesopotamian centres in the East, Central Italy and the Euboean colonies in the Central Mediterranean, and indigenous centres in the Far West.

The finds of Phoenician ivories in some quantity in Crete and Samos are attributed by Barnett to the settlement of Phoenician craftsmen at the famous shrines of the Idaean Cave and the Heraeum: 'The settlers established a taste for their work, perhaps married locally and taught their trade to Greek apprentices'.[21] Dunbabin suggests that there were similar

establishments of Phoenician metalworkers on Crete and similar settlements of 'foreign artisans' are envisaged in Etruria.[22] Phoenician artisans are thought to have been established in Nimrud: and the presence of Phoenician glassworkers in Mesopotamia has been proposed on the basis of the Egypto-Phoenician influences on motifs of Assyrian glasswork.[23] In fact, there is no need to envisage the presence of craftsmen in the many centres where ivories and other Phoenician luxury items are found since this underemphasizes the role of the merchants and representatives of the king in their distribution.

The reference in the Odyssey to the one-year sojourn of the 'Sidonians' illustrates – although possibly exaggerates – the nature of Phoenician transactions within the Eastern Mediterranean. That is, even within the Aegean they can be seen to have acted as collectors and carriers of commodities over short distances. The traders' interest was to exchange one commodity for another to be exchanged elsewhere for yet another in order to make a profit. Since trade must logically take place to the benefit of all partners, we can assume that the Phoenician contribution of skills in transport technology served to link separate trading spheres in which they could then take advantage of differences in exchange rates. For example, Egyptian commodities reached Greek centres by way of Phoenician traders.[24]

Phoenician traders therefore linked specialist production centres, often involved in the manufacture of luxury items, and in so doing they effectively connected distinct political entities. The Phoenicians are seen to have exploited the absence of organised exchange relations between different spheres in order to establish a rate of exchange between commodities which was to their advantage. By monopolising the source of production of specialised commodities and then controlling their distribution by dominating maritime transport, the Phoenicians had effectively extended the range of manufacturing processes under their command without having to bear the costs of production. Phoenician traders were then able to find or to create demands for the specialised commodities (whose high costs would have prohibited their local production) to which they had sole access and were in a position to supply at low transport costs. And since many of these luxury commodities – or the raw materials needed for their production – were available within easy reach of the Phoenician cities, eg. from Egypt or Cilicia, they could be obtained in exchange for home produced high bulk, low cost commodities such as dyed cloth. At a later stage in the development of this regional trading network, the Phoenicians became involved in the production of some of these luxury items, either by establishing new centres of production in their own cities (as mentioned above) or by settling Phoenician craftsmen

in the original production centres. The latter would signify Phoenician commitment to the particular sphere of exchange, its maintenance and its expansion at the production level. An example of this is the Phoenician involvement in faience production in Egypt where Phoenician imitations of Egyptian faience were produced at the latest by the 8th century in the Egyptian town of Pi-em-ro (which later became Naucratis).[25]

There is evidence to illustrate both types of Phoenician intervention in production and their role in distribution from Rhodes. Coldstream has described the different phases of unguent container production of Rhodes,[26] but evidence for the beginning of Eastern connections comes from cemeteries on Cos. Middle Geometric wares (c.850–750) were found there with imported Phoenician unguent vessels with characteristic neck-ridges and black-on-red decoration. These, says Coldstream, 'represent the commercial enterprise of the Phoenicians, then just beginning to penetrate Aegean waters', and local – Hellenised – imitations were subsequently produced in the Dodecanese. In the cemeteries of Ialysos, Camiros and Exochi on Rhodes, graves dated to the 2nd half of the 8th century contained a number of 'Oriental' type unguent containers. Some of these were imports. Others, clearly local imitations, were not at all influenced by the indigenous Late Geometric style of the larger container type and open vessels. Coldstream proposes that these unguent containers were made by Phoenicians resident on Rhodes and involved in unguent production and trade:

> 'Prior to their arrival, the island seems to have played only a passive part in commercial exchange, since no Rhodian object earlier than the late 8th century has been found abroad. But, from c. 725 onwards Rhodes suddenly begins to take the initiative: a most striking symptom is the export of aryballoi . . [the 'Rhodian' aryballoi] whose oriental character and wide distribution (but always in a westerly direction) argue strongly for the commercial energy of the resident Phoenicians.[27]

To support his argument for the settlement of Phoenician '*metoikoi*' on Rhodes, Coldstream cites the 'Egyptianising objects in faience or glazed frit, which have been found in Rhodian graves and sanctuaries from the late 8th century until well into the 6th'. Furthermore, one of the 'glazed clay' flasks common to Rhodes was associated in a grave in Ialysos with a group of 'un-Hellenic' pots and figurines. And some burials of children from Ialysos and Camiros were inhumations in 'Phoenician-type coarse amphorae' as found in 'the Phoenician colonial cemeteries of Carthage, Motya and Kition'.

It is possible to interpret this evidence somewhat differently in the context of the Phoenician trading organisation described above: slow-pouring unguent containers – and probably unguents too – were introduced into the Dodecanese and Rhodes (as well as into Syria, Cilicia, etc.) by the Phoenicians in the late 9th and early 8th centuries. On Cos, local production was reorganised for general pottery manufacture and possibly unguent production. But on Rhodes, the Oriental types of containers were imitated as closely as technically possible in order to supply the Phoenician traders calling at Rhodes who would as readily use these 'Rhodian' aryballoi as the Phoenician or Cypriot equivalents, the production costs of which were probably greater. In fact, the westerly distribution of the aryballoi can only be explained by Phoenician involvement in their distribution. The Rhodian production of Phoenician-type containers for the use of Phoenician merchants was stimulated by the introduction of a new commodity into the introduction of a new commodity into the Aegean, viz. faience. Its distribution in the East – and in the Western Mediterranean – again denotes Phoenician carriers. Another example of Phoenician intervention in the distribution of Rhodian wares, as proposed by Coldstream,[28] are the Rhodian bird kotylae found in a late 8th century context at Al Mina.

To summarise, we can say that having introduced a new commodity – unguent containers – the Phoenicians organised its production at a new centre within their trading sphere, thereby adding another link in their chain of exchanges between the homeland and their trading partners, within the Aegean or further west. It is of course possible that Phoenician craftsmen were involved in the aryballos production on Rhodes but we suggest the degree of stylistic and especially technical variation from the Oriental prototypes and the organisation of Phoenician trade make this less likely.

Phoenician commodity production was more or less limited to high value items, produced by means of a specialist technology involving high skill and scarce materials, e.g. metal worked into ornately decorated containers, intricate and technically elaborate jewellery.

Wood was worked to produce fine toilet items or furniture, often with inlay. Ivory was worked to produce the embellishments for furniture but also carvings and sculpted pieces. Cloth and dyes were combined to produce the 'ornamented garments' much desired by Assyrians and frequently referred to in the tribute lists. It is likely that plain cloth was obtained through trade and that is was dyed, embroidered and made into 'western' style garments in the Phoenician cities. The fact that most of this production was for exchange and prescribed presentation meant that production was often adapted to suit the tastes and demands of their

customers in terms of what they produced and often the 'cultural' content of their products. For example, the furniture from which the ivories (like the 'Layard group') came was, according to Barnett,

> '. . . evidently an expensive fashion that prevailed in royal circles in the ninth-eight centuries B.C. Very similar collections have been found in the Assyrian palaces of Assur and Khorsabad, the Aramaean palaces of Hadatu (Arslan Tash) and Sam'al (Zincirli) at Carchemish in North Syria and at Samaria in Palestine.'[29]

This type of furniture was being produced on a considerable scale, was becoming repetitive in its execution, and was destined for elite consumption in Near Eastern and even Cypriot centres (e.g. Kition).

In the case of ivory-carving, this trend in manufacture resulted in the style described alternatively as the 'unlovely symposium of Egyptian, Assyrian and even Hittite forms',[30] or as 'bastard, since it disregarded all the precise standards which the Egyptian artists had laboriously built up. .'[31]. and in what Barnett more aptly described as the 'characteristic features of Phoenician art: great technical accomplishment, but little conviction or real feeling for form'.[32] However, Barnett defends the way in which the Phoenician craftsmen incorporated elements of Egyptian iconography into their own art style and – more significantly – its symbolism.[33] But as Aubet has shown, the production of the best Phoenician ivories of the 9th and 8th centuries was followed by a period in which ivory was engraved instead of carved and in which the themes portrayed were neither symbolic nor narrative but represented purely ornamental combinations of traditional themes. She considers the Western ivories, from Carthage, Carmona and Samos, to be the lowest level of ivory production.[34]

This degeneration in style and technique of ivory working, especially during the 7th and 6th centuries, is related to the increased production and to the intended use of ivories beyond the Western Asiatic and Egyptian sphere in which ivory carvings had served *per se* as symbols of political power[35] and by their content had served a religious or ritual function. But in different cultural contexts the ivories no longer had these functions and their lack of symbolic content did not detract from their use as high value items for exchange or – as is more likely – as presentations to indigenous 'rulers' with whom the Phoenicians dealt beyond the Western Asiatic trading sphere.

What is known about ivory production can be assumed, but not yet proven, to be valid for other specialised commodity manufactures in the Phoenician cities at the same time.

Phoenician metal vessels are rare in the East and the probable

products of Phoenician and/or Cypro-Phoenician workshops are best known from finds in Italy and Iberia, where metal vessels are found in graves. Eastern Phoenician cemeteries, and even 'rich' Phoenician graves in the West, do not contain bronzes as grave goods; instead, fine red slip wares, often imitating bronze forms, were placed in the graves. Similarly, Phoenician jewellery is best known from finds in the Central and Western Mediterranean.

From what we know about Eastern Phoenician production of luxury items we can predict something about their use in exchanges beyond the Western Asiatic trading system. It is reasonable to assume that the use of categories of material will be the same in both spheres and that ivory will remain a presentation item, whereas batches of exotic items, like faience or glass objects, scarabs or fine pottery wares will continue to be used in exchanges. The occurrence of large numbers of Lyre Player seals in Pithecusae represents the latter strategy. And by recognising instances of Phoenician trade with some Aegean centres, Egypt and Cilicia, as being directed to obtain supplies of 'exotica' as an initial stage of a western trading venture, we can explain the often remarked upon mixture of goods of diverse Eastern Mediterranean origin occurring on Phoenician sites in the Central and Western Mediterranean, e.g. the foundation deposit at Carthage. The interrelationship of Phoenician and Greek trading ventures in the Central Mediterranean can be seen, on the basis of evidence from Pithecusae, to have been greater than formerly believed.

Another aspect of Phoenician trading activities was the founding of trading posts. The need for facilities for transport and storage would have arisen in areas where exchanges were established on a regular basis. They were also needed to secure reliable trade routes and to monopolise the access to established trading partners. With the establishment of regular trading posts beyond the original trading sphere, the transportation of commodities of greater bulk, such as cloth, oils, etc. could also be undertaken.

The Phoenicians in the Far West

As we have already seen, the expansionist tendency in the Phoenician trading strategy was determined by the material demands of the Assyrians and particularly the supply of certain crucial resources, eg. silver, in increasing quantities in the 8th and 7th centuries. Irene Winter notes that:

> '. . . the Phoenicians by virtue of their foreign sea trade were able to provide goods and services (like supplies of silver from the Río Tinto mines in southern Spain) which the Assyrians could not otherwise obtain, as they were neither equipped nor ready to assume the risk of taking on the maritime activities themselves.'[36]

Phoenician interest in the Western Mediterranean, and particularly Southern Iberia, therefore has to be seen as a logical extension of the trading activities in the Central Mediterranean. This would be determined, in turn, by the incapacity of their trading partners in the Central Mediterranean to supply all their demands or at least only at rates of exchange that would be set increasingly in favour of their trading partners. This must inevitably be so as competition between Phoenician traders for a finite supply of resources led to an increase in demand and a rise in the rates of exchange. Hence, the fact that there is in any mercantile economy an incentive to find new sources of commodities at lower rates of exchange must lie behind the exploratory trading ventures the Phoenician traders continually engaged in. We could well argue that some of the resources of the Iberian peninsula were already well known to populations in the Central Mediterranean from contact at earlier periods. But even if this was not the case, Phoenician exploratory voyaging in the Western Mediterranean and beyond would have rapidly encountered existing, and in some cases complex, local regional trading networks that they could manipulate to their advantage.

Geographically, the Western Sphere of Phoenician acticity is essentially that area defined by Braudel as the Mediterranean Channel.[37] It is one of the 'narrow seas' of the Mediterranean, like the Aegean, Adriatic and Tyrrhenian seas, which are characterised by the intensity of maritime communication within its confines. These narrow seas came to be connected up by the activities of long-distance traders who skirted or crossed the 'maritime Saharas', ie. the Ionian and Western Mediterranean basins. Although Braudel defined these units for the analysis of the Mediterranean world of the 16th century AD, the nature of navigation and communication in the 1st millenium BC would have been constrained by the same gross environmental and even technological factors and this pattern of localised and long-distance trading systems appears to apply to the period we are dealing with here.

Archaeologically, a Western Phoenician Sphere, distinct from that of the Central Mediterranean, was first recognised by Tarradell.[38] It includes Phoenician foundations in North Africa and Iberia, east and west of the Straits of Gibraltar, i.e. essentially within the Mediterranean Channel and its immediate Atlantic extension. Important progress has been made in identifying this Western Phoenician sphere based on studies of Moroccan material – Phoenician and indigenous – by Tarradell, Ponsich and Jodin.[39] The Iberian and North African areas of the Western Sphere are clearly

strongly interrelated and the distribution of a number of specifically Western Phoenician forms are limited to its confines, e.g. small globular oil bottles, tripod bowls, certain urns and amphorae.[40] In addition, some of the most characteristic Central Mediterranean material – like razors and certain jewellery types – are conspicuously absent from the Western Sphere.[41]

Good evidence is now available from Iberia for Phoenician sites established there by the late 8th century. The dating is based on finds of Greek pottery in undisturbed contexts at Toscanos and Almuñécar and the typology of Phoenician material found on these sites. Pellicer, Schubart, Niemeyer, Lindemann and Aubet have defined a range of late 8th and 7th century Phoenician material and a coherent picture of Phoenician enterprise in Southern Iberia is emerging.[42]

On the basis of this evidence from a series of sites, both indigenous and Phoenician, we propose that two phases of the functioning of the Western Sphere can be recognised in Iberia. The first phase was based on the manipulation of existing Iberian trade networks, which at that time – the 8th century – were Atlantic oriented. In the second phase, a greater Phoenician commitment to the Western sphere is represented by the intensification of commercial activies initiated there in the first phase.

During the 8th century BC the major bronze-working centre in Iberia, in the northwest of the peninsula, played an important role in the 'Atlantic Late Bronze Age'. This Northern European trading system, based on the Atlantic seaboard of the continent and in southern Britain, would have been affected by the changes brought about by the beginning of Hallstatt C in Central Europe. At this time, bronze production and the trade in raw materials were reoriented to new outlets in Southern Europe and an iron technology was introduced in Central Europe. Only isolated elements of this Central European complex are known from Northern and Western Europe. This would suggest that the Atlantic bronze industries that had been supported to some extent by Central European supplies of raw materials would have had to gain access to new supplies and/or reduce the scale of production of high quality bronzework. The Northwest-Iberian bronze-working centre appears to have begun, at this time, to tap Southwestern copper resources to supplement the few copper sources available in this tin-rich area. Within the Atlantic regional network, there is evidence from the seaboard to suggest that materials and finished products were stored near the coast and transported in short relays. The finds of Irish bronzework in Iberia, and vice versa, and the representations of Northern European metalwork on stelae in Extremadura are indications of the extent of this circuit.

Of course, this pattern of collection and distribution presented an ideal opening for the intervention of specialist traders in an entrepreneurial role. It is proposed here that it was Phoenician merchants who adopted this entrepreneurial role, thereby penetrating the Atlantic regional network. In so doing, they linked discrete local elements of the trading system and could gain economic advantage in the exchanges they then transacted. More important, they themselves gained access to the resources and products circulating within this trading system. It has long been recognised[43] that certain Mediterranean bronze types reached Northern Atlantic Europe in the 8th century and a possible route for their transportation round the Iberian peninsula has been signalled by the cargo of a ship that sank at Huelva. Its contents have been interpreted in many ways and although Daniel and Evans interpreted the cargo in terms of 'the activities of Phoenician traders' on 'the coasts of Atlantic Europe' this view has not been generally accepted.[44] It is interesting to note that the only parallels found in Iberia for some of the Atlantic type material found in the Huelva cargo come from the Gabezo de Araya hoard in the province of Cáceres. The similarity of some of their contents suggest that both lots of material were collected and 'lost' as part of the same trading activies. A late 8th century date is likely for the deposition of both hoards, despite the earlier date of some of their contents.

In addition to bronzework, amber and gold were probably available to the Phoenician merchants tapping this Atlantic network. An important gold-working tradition – attributed to the Late Bronze and Early Iron Age – is known from the Central and Northern Atlantic seaboard of Iberia and the incorporation of certain characteristic Phoenician techniques of goldworking resulted in the production of some of the most spectacular products of this centre, ie. the Aliseda jewellery, also found in Cáceres. The availability of amber is suggested by the frequent association of amber with Phoenician bronzes and jewellery in Iberia. This association tends to be replicated in the Central and Eastern Mediterranean.

In the West – as in the Eastern Mediterranean – the Phoenician merchants' strategy was to obtain access to the output of indigenous production centres or resources and then to use them to gain access to new markets or to initiate the exploitation of new resources in other areas. In this way they connected up economically discrete regions and were able to benefit from the mercantile profits made by exchanging manufactured goods for raw materials for which there was a high demand in home markets. In the case of Northwestern Iberia, Phoenician intervention appears to have benefitted the indigenous bronzeworking centres too: they continued to function into the 7th century – and later – producing a wider range of products and maintaining their high quality. This contrasts markedly with the Armorican – and other Atlantic – bronzeworking cen-

tres whose production was disrupted in the 7th century.

As an extension of their involvement in the small-scale relay trade in metal products and materials on the Western Iberian coast, the Phoenician traders were probably responsible for the distribution of the few Northwestern bronzes in Southeastern Iberia on their way to the Central Mediterranean. In fact, the trail of Northwestern (and other Atlantic) bronzes on the islands of the Western Mediterranean maps their island route eastwards. The distribution of Atlantic bronzework, identified in the Balearics and Southern Sardinia, would indicate that this 'island route' between Spain and Italy was 'tramped' – as Braudel terms this short stop navigation pattern – by Phoenician traders in the late 8th and 7th centuries.

On Sardinia, a number of hoards and stray finds testify to the presence of long distance, specialist traders bringing products of the Atlantic bronze industries to the island. In this way the Phoenicians provided Sardinia with raw materials as well as encouraged innovations in style and technique derived from Atlantic bronzeworking centres at a period when there was great demand for good quality bronzework within the Central Mediterranean. The Monte Sa Idda hoard contained many rough castings of Atlantic bronzes but also included distinctive Northwestern and Central Iberian types such as the double-looped and flat-backed palstaves and the swords and daggers derived from the Iberian Carp's Tongue series. Some eastern bronzework was included too. Hencken dates the Monte Sa Idda hoard to later than the Huelva material on the basis of the typology of some of the swords related to the Italian Carp's Tongue series.[45] Another hoard of the same date – from Forraxi Nioi – contains Atlantic and Northwest Iberian bronzework associated with scrap and with amber beads, which could also have been brought by Phoenician merchants. Guido has noted that there are many hoards of axes and/or copper ingots which predate the Phoenician introduced metalwork on Sardinia.[46] Thus, an opening for a Phoenician role in the Sardinian bronze industry was almost certainly due to the need for an external source of tin with which to maintain the high quality and large quantity of bronzeworking in the Full Nuraghic period. The Phoenician interest in this island appears to have been to gain access to silver and certain types of copper ore, the exploitation of which was initiated in this period.

We can summarise this initial phase of Phoenician trade in the Far West as follows: specialist traders intervened in the Atlantic regional trading network by operating on the Western Iberian seaboard. From this network they took bronze, raw materials, probably gold and amber, and used them to link up the islands of Sardinia and Sicily with North Africa and Northern Italy where such materials were much in demand. Valuable commodities such as gold, silver and amber would have been used there

for the production of distinctive jewellery – distributed mainly in the Central Mediterranean – and these would also have been the commodities fed back into the Western Asiatic regional system in the form of trade items, tribute or tax.

A second phase of Phoenician activity in the Far West in the 7th century involved a shift to direct intervention in resource production within Southern Iberia. Because of this, larger quantities of Phoenician luxury commodities and craft goods were required in this phase. It therefore represented a greater commitment by the Phoenician traders – and hence their homeland firms – to the western sphere and coincides with the period of increasing Assyrian reliance on the trading enterprises of the Eastern Phoenician cities. Thus, the intensification of trading activities in the Western sphere was clearly aimed at both boosting Phoenician trade in the Central and Eastern Mediterranean and at supplying the Eastern Phoenician cities directly with new resources and trading outlets.

This commitment to the Western Sphere, and to Iberia in particular, is recognisable in the number of sites established by the Phoenicians in Southern Iberia and in the range and intensity of craft and other activities carried out at them. The Phoenician sites are situated mainly on the Mediterranean coast of Southern Iberia, between Adra and Málaga.[47] Known as 'factories', they represent the development of trading posts with storage and other basic facilities into veritable industrial centres where pottery, dyes, oils, wine, fried fish and probably unguents would have been produced for local exchange. At the best known site, Toscanos, the excavators have recognised the site to have flourished mainly in the 7th century.[48] Significantly, they remark on the fact that it is precisely during this period that relations with the homeland were of greatest intensity.[49] This is attested by finds of alabaster vessels, high quality red slip ware, a serpentine plate, and some sherds of Attic SOS amphorae and Proto-Corinthian kotylae: all of which were in deposits clearly associated with the use of the large storehouse.

It can be proposed that the obvious focus for Phoenician interest in this area and the main reason for establishing production centres in the Far West must have been the possibility of exploiting the silver ores in the Huelva hinterland. In order to initiate the exploitation of these ores, the Phoenician merchants would have had to establish reliable relations with the indigenous population of the coastal hinterland and with those in areas with maritime, riverine or overland access to the important source areas. A workforce would have to be attracted or contracted and the production of foodstuffs for the maintenance of specialists in diverse industries ensured. It is in terms of these specific aims that the establishment of the production centres on the coast and the evidence for relations with

the indigenous populations must be examined.

The most important evidence for Phoenician involvement in ore extraction comes from the excavation of the Cerro Salomón, Río Tinto.[50] This settlement of small rectangular rooms contained slag and other debris from metal extraction throughout the habitation remains which covered the entire 1 km long hill-top. According to Blanco and Luzón, most of the c. 20 million tons of slag at Río Tinto are the remains of ancient silver-working, with only a small amount of slag possibly representing copper extraction. Similar deposits of slag from silver-working are known in the hills surrounding Río Tinto and the scale of silver extraction in the area was obviously phenomenal. Blanco and Luzón point out that silver-working was carried out in all the small habitation units on the Cerro Salomón and the dispersal of the slag throughout the buildings differs significantly from the great mounds of slag found in restricted areas of Roman silver-working settlements.

In the nearby city of Huelva, Phoenician remains of 8th century date are rare but 7th century material is known from many areas of the city. Slag from silver-working and smelted fragments with crucible impressions were recorded in deposits on the hills of La Esperanza and San Pedro. It is significant that many of these indigenous settlements in the Huelva area were founded in the 7th century and a relationship must exist between this growth of the population of the hills of Huelva and the exploitation of ores in the mountains of its hinterland. It is quite likely that silver was extracted and worked within the major indigenous settlements, from which the labour force for the industry would have come, as well as on the primary extraction sites in the resource area.

It is suggested here that although the Phoenicians instigated its exploitation they would not themselves have monopolised the extraction of silver. Thus, it can be envisaged that Phoenician traders — or associated 'experts' — would have supplied the technology and organised the initial exploitation: this phase is represented by the masses of early 7th century Phoenician material, such as amphorae, lamps, etc., found on the Cerro Salomón. At a later stage, the Phoenicians would have obtained through exchange the silver they required when it had been produced by a local labour force. The Phoenician traders proffered a variety of goods brought from the East or produced locally and these are represented by materials, such as fine pottery wares, bronze vessels and jewellery, found in graves and the contents of course pottery containers, viz. oils, wines, dried fish, unguents, found in graves and settlements.

The 7th century Phoenician production centres were located on the coast, usually at the mouth of a river which was important both for providing fresh water and as a route for communication with the interior.

The coastal zone between the Vélez and the Algarrobo rivers is connected via a mountain pass to the rich agricultural lands of the Guadalquivir valley, the Campiña and Alcores areas. Similarly, the Guadalhorce river valley is a natural route into the Guadalquivir. The Phoenician coastal sites were sometimes within a couple of kilometres from each other and their distribution suggests that their locations were of complementary advantage. Similarly, the evidence from their occupation suggests differences in their functioning. For example, Toscanos was a centre of dye extraction and presumably cloth dyeing, as indicated by the large quantities of murex shells excavated there. It also contained a workshop for other crafts and considerable storage facilities. A number of specialised craftsmen and merchants, deep-sea fishermen, navigators, ships' crews and probably ship-builders would have been based in settlements like Toscanos. Therefore, in addition to a need for labour from indigenous populations to sustain many production processes, the Phoenicians would have required access to foodstuffs which could not have been produced in sufficient quantitites in the immediate surroundings of their coastal centres. We must therefore envisage the establishment of regular inland routes and the faunal evidence of remains of donkeys and horses from some sites, such as Guadalhorce, would support the view that some centres were more involved with the distribution of Phoenician products and the collection of supplies of foodstuffs from the interior than with specialised production.

A distinctive feature of this second phase of Phoenician involvement in Southern Iberia is the production of distinctive pottery types: painted wares, red slip and a fine grey ware. Remains of these are found in all the known settlements of this period from the Guadalquivir valley, especially between Sevilla and Cordoba, as well as from the Jeréz and Huelva areas. These wares — and their contents — also reached the Central Portuguese coastal area, Eastern Andalusia and the Levantine coast. In their widest distribution, they can therefore be taken as indications of the continuing interest of the Phoenicians in a now more restricted Atlantic trade (as confirmed by the finds of bronze vessels and gold jewellery in Atlantic Iberia) and in the maritime route, 'tramping' the islands, to the Central Mediterranean.

Although we cannot deal in any detail with the nature and distribution of the finest categories of Phoenician materials found in Iberia, viz. ivory, alabaster, bronze vessels and jewellery we must point out the most significant feature of their distribution. In particular ivory and alabaster items are seen to correspond virtually exclusively with the two areas of resource exploitation in which the Phoenicians were involved, ie. the Huelva area and the Guadalquivir area. We can envisage that in order to maintain their control over the silver resources of the former and the agricultural

produce of the latter areas, the Phoenicians provided a range of materials as listed above. The exchanges involved high bulk low value commodities, produced locally, and highly valued items (usually Eastern imports) which were probably 'gifts' rather than goods used in equivalent exchange. The confirmation of contractual arrangements and the reinforcement of political alliances through gift exchange was practiced in the East. There, the possession of ivory and alabaster appears to have been a royal prerogative. In the West, the Phoenicians expressed their acknowledgement of rank in the indigenous societies by presenting their 'rulers' with categories of material denoting 'royal' status (as discussed above).

The organisation of the Western Sphere

This second phase of Phoenician enterprise in the Far West corresponded with the period in which the independent Phoenician cities were subject to increasingly severe 'tribute' and trade impositions from the Assyrian kings. Thus, their autonomy depended on their success in establishing and maintaining their semi-peripheral functions within the Western Asiatic regional system. They functioned as suppliers of raw materials and valuable commodities to the Assyrians, and other partners in the trading system, and this was achieved due to the success of their Western maritime expansion.

As recognised by Winter and Oded,[51] the relative independence of Phoenician cities like Tyre, Sidon and Byblos in the late 8th century can be related to Assyrian recognition of the economic potential of these commercial city states and an appreciation of the economic role they could play if left to their own trading strategies. The Nimrud letters refer only to restrictions on the timber trade and to a tax imposed on this trade which would have enabled Assyrian officials to follow – if not to control – some aspects of the city's trade.

In his paper in this volume, Postgate has pointed out that the Assyrian kings 'expected the merchants of the Levant and of Babylonia to carry on with their own mercantile activities without further interference from the government'. He cites the Nimrud letters and the recognition of the achievement of Sargon in opening Egypt to trade in support of this view. We may add that the treaty between Esarhaddon and Baal, of Tyre, after the defeat of Sidon and Egypt in 671 supports this view. The treaty deals with the obligations of Baal to the Assyrians and the role of the Assyrian governor at Tyre. However, the autonomy of the city and the rule of the king and 'the ancients of the land' was not undermined. Tyrian traders had to obtain permission prior to visiting ports in territories under Assyrian control but the ships of the king and those of 'the people of the land' were still free to operate beyond the Assyrian sphere.

Another point made by Postgate is relevant here. He notes that during the reign of Sargon the supply of silver circulating in Assyria was considerably increased and by the late 7th century 'silver was the generally accepted currency throughout the empire'. Balmuth has pointed out that silver coins, inscribed with the name of Barrekub, were found with disc-ingots and 'Hacksilber' in the palace of Barrekub, a vassal of Tiglath-pileser in c. 730, at Zinjirli.[52] This implies that silver – used as a medium of exchange and currency – created a new hoardable form of wealth which boosted the demand for silver at the same time as it was required for the manufacture of fine wares and jewellery. It can be proposed that with such an enormous increase in the supply of silver to the Assyrian cities in the 7th century – which we believe was provided by the Phoenician merchants – the ability to control its acquisition and hence value would be undermined by the enormous quantities in circulation and storage. This would ultimately have resulted in a decline in external demand and dependence on its source.

Since silver and gold were low bulk/high value commodities, it can be envisaged that these were taken by Phoenician merchants from the Far West to the Eastern Phoenician cities to be used there in trade, manufacture and tribute or tax payments. Other resources and products procured in the Western sphere would have been used in exchanges within the Central Mediterranean and some items of Phoenician manufacture from Mediterranean centres were circulated in the Eastern Mediterranean.

So far, we have dealt almost exclusively with the trading strategies of the Phoenician merchants and the role of their cities within the regional economy. We can also attempt to describe the organisation of these merchants and their business operations.

As mentioned above, the mercantile 'firms' are known to have been operating in Canaanite towns, also Ugarit, and their Phoenician successors. The organisation of 'firms' in Assur, and their representatives in colonies in Anatolia, have been studied from Old Assyrian texts found at Kanesh (Kültepe) by Larsen.[53] These 'firms' were kinship-based groups and Larsen[54] proposes that 'the predominance of the family may in fact be a feature which is closely linked with the recurrent pattern of city-states with commercial colonies involved in long-distance trade'. This type of kin-based organisation can be proposed for Phoenician traders and other occupational specialists too. In the Old Testament we have references to Phoenician 'household' organisation in I Kings V, 11, when reference is made to the provision of foodstuffs by Solomon for the 'household' of Hiram I of Tyre. The king's household would have been the largest of many occupational groups organised on a kinship basis. Harden describes the textile industry in Phoenicia, as follows: 'Mostly, the spinning and

weaving will have been a home industry, not openly commercialized, though some householders must have used slaves to do it on an organized scale'.[55] And Moscati notes that the organisation of the textile industry at Carthage was also originally on 'family lines'.[56] We note too that the means by which these 'households' could be extended was by the incorporation of slave or other dependent labour, e.g. by intermarriage with the Danites.[57] In I Kings VII, 14, there is a reference to a Tyrian bronzeworker involved in the construction of Solomon's temple: he too operated within a kin-based group: '. . . . . his father was a man of Tyre, a worker in bronze . . . ', just like his son, and his mother is described as being 'of the tribe of Naph'tali'.

This is a significant aspect of Phoenician social and economic organisation, i.e. members of other tribes or cities could be incorporated within kin-based groups and hence increase the population of individual cities – and later colonies. During the Late Bronze Age and the Iron Age there was no unified ethnic identity, other than that imposed by others, for the inhabitants of the Levantine coast, viz. 'Canaanite' and 'Phoenician' were terms that were applied to the heterogeneous populations of the coastal cities by their contemporaries. The populations of these cities included residents from different Syro-Palestinian cities, as well as elements of other Western Asiatic or Eastern Mediterranean centres. Ezekiel's lament for Tyre (XXVII, 8-24) mentions the diverse origins of merchants, elements of the army, and even the participation of the inhabitants of Sidon, Arvad and Byblos in Tyrian maritime ventures. The term 'Phoenician' therefore refers to a category of people involved in certain recognisable activities rather than to a single ethnic group, e.g. in the Homeric poems, all traders are 'Phoenicians'. The assimilation of elements of Aramaean and Israelite populations seems to have occurred in this way. That is, by taking on Phoenician language and ideology, people of different origins could take part in characteristic Phoenician activities and thereby become identified as Phoenicians. In fact, the inhabitants of Phoenician cities continued to regard themselves as 'men of Tyre' or 'men of Byblos', and so on.

Similarly, the Phoenician foundations in the west would have had two major components: the Eastern Phoenician traders and settlers; and elements of indigenous populations that achieved 'Phoenician' identity by taking on Phoenician activities. Those elements of the indigenous population that attached themselves to the Phoenicians would probably already have been involved in the sort of commercial or manufacturing activities encouraged by the newcomers in order to create new forms of wealth. The degree to which indigenous polulations were incorporated as 'Western Phoenicians' is difficult to assess but the density

of Phoenician sites in the West and the intensity of their activities there are unlikely to have been accomplished solely by the population of the Phoenician homeland and would at least have involved a degree of participation by peoples of the Central and Western Mediterranean as well as of North Africa.

However the presence in the Far West of high-ranking traders, expedition leaders and craftsmen can be assumed from the evidence there of burials with special categories of grave goods, such as alabaster urns, gold jewellery and Greek vases. The tombs found at Almuñécar and Trayamar, necropoli associated with important 'factories', indicate the recognition of the status of some Phoenician residents of the Western settlement: we can assume that these were 'men of the city', representatives of Eastern firms in the Far West. At Almuñécar they were buried in shaft graves; at Trayamar in ashlar built chamber tombs: both forms of burial are unusual for the Western Sphere. The fact that these were collective tombs to which burials and/or offerings were added to existing burials suggests that the kin-based organisation of the trading firms and specialist workshops proposed for the Eastern Phoenician cities was dominant in the West too when 'branches' of the Eastern firms were established there.

Conclusions

It is clear both from texts and from the political situation outlined above that the Phoenicians were generally regarded by their contemporaries as specialist traders. In the Odyssey they are characterised as traders and navigators: the suppliers of fine metalwork, cloth, jewellery and slaves to the Greeks.

The leadership of the actual trading expeditions would have been in the hands of specialist traders of some repute. The status of men like Hanno and Hamilcar – who also undertook exploratory expeditions – illustrate the prestige of these expedition leaders who, like their counterparts in overland caravan trade, would have controlled the organisation of men and ships, would have known the routes and destinations and also prescribed the nature and extent of the exchange transactions. If we are correct in viewing the traders as owners of their ships, this would contribute significantly to explaining the extent and intensity of Phoenician ventures within – and beyond – the Mediterranean. If the ships were owned by the city, the incentive to establish new routes and trading situations would not have been as great as when the traders themselves were responsible for the ventures and, of course, for the gain they could accrue. Although the fortunes of the Phoenician cities under Pharaoh Necho and then under Babylonian and Persian rulers do not concern us here, it is

worth noting the important role in both overland and maritime trade they maintained in the new configurations of the Western Asiatic regional system. Rostovtzeff points out the similarity in the organisation and functioning of the caravan trade in Western Asia during the Neo-Assyrian, Babylonian and Persian empires:

> 'It was this caravan trade that brought riches and splendour to Aleppo and later to Damascus, the most flourishing cities of the Near East, and it was this caravan trade that put the Phoenician cities of Tyre, Byblos, and Aradus in a position which enabled them to acquire outstanding importance in the development of commerce.'[58]

The repute of individual traders, as well as the combined efforts of merchants of the Phoenician cities, is evident in the continued involvement of the Phoenician cities in international trade in the time of Nebuchadnezzar II when the chief merchant was probably a Phoenician

> '. . . which can most likely be taken as an indication that trade with Phoenicia was either in the hands of the natives of Tyre or controlled by them in some way. It combined with the delivery of typically Phoenician products with the procurement of essential raw materials from other countries, such as Egypt and certain places in Asia Minor, whereby the Phoenicians acted in their well-known function as intermediaries, as middlemen . . . . . '[59]

In the time of the Neo-Assyrian empire, the Phoenicians established a Western trading sphere as a new peripheral area from which they tapped resources and products initiated the exploitation of certain resources and increased the exploitation of others. Through the intermediary of a local elite, confirmed by their possession of high status Phoenician objects, the surplus of domestic resources were produced for Phoenician consumption. Thus, relations with the Phoenicians would have brought about changes in the indigenous society in terms of economic and political dependence on exchanges within a regional as well as an international trading system. This was probably the major Phoenician contribution to the later 'Iberian civilisation', i.e. they had instigated the initial incorporation of Southern Iberia in the Mediterranean trading network, as a periphery of a Western Asiatic regional system. This Mediterranean trading network was boosted by the Western Greek cities from the end of the 7th century and the degree to which Iberia was incorporated became considerable during the 6th century when the 'Iberian civilisation' took on many distinctive

features of the Greek states.

Thus, Iberian relations with the Western Greek city states involved the creation of a new, economically specialised semi-periphery with all its concomitant structural features. In many respects these developments were similar to the processes of 'orientalisation' and 'civilisation' observed in Etruria in the late 8th and 7th centuries. This contrasts markedly with the Phoenician/Iberian relations. The Phoenician commitment to the Far West was always in terms of obtaining resources. It was not for territorial acquisition or political domination. The resources were needed to establish and reproduce the Western Sphere in order to maintain and reproduce the Eastern commercial city states and to continue their function within the Assyrian dominated Western Asiatic regional systems. The commitment of the Eastern cities – and their firms – to the Western Sphere was insufficient for the trading posts and production centres to develop towards a phase of independence of the homeland cities. There was no investment in the production centres on the scale of the Central Mediterranean centres and the population of the Western settlements appears to have been specialised and in a sense transitory.

The decline of the Western Sphere is usually seen in terms of the expansion of Carthage, but the expansion of Carthage was only possible when the Western Sphere no longer functioned as a separate trading network. The reasons for the abandonment of the Western Sphere lay partly in the Eastern Phoenician cities. One of the decisive factors would have been the decline in silver requirements of the Assyrian empire, at the time when a surplus of silver had been achieved and silver ingots began to be hoarded and thereby removed from circulation. Another factor was the expansion of the activities of the Greek cities in the Central Mediterranean into the Western Mediterranean and in particular to the Levantine coast of Iberia. This brought about a situation of independent and competitive access to Iberian resources at the end of the 7th century. And a third factor was the increasing incorporation of Central Europe, North of the Alps, into the periphery of the Central Mediterranean Greek and Etruscan cities: in this way independent access was established to many of the resources – such as copper, tin, precious metals – for which the Central Mediterranean centres had previously been partially dependent on Phoenician enterprise, particularly in the Far West.

PRIMITIVE CIVILIZATION OF THE EASTERN SLAVS

By S. H. CROSS

THE status of social organization and primitive government among the Eastern Slavs at the dawn of their history is not definable with complete certainty, but may best be determined by comparing the data preserved both by the earliest native sources and in the accounts of contemporary foreign observers with survivals of early custom and usage among the modern branches of the Slavic race least touched by the inroads of modern culture. Accurate definition of early Eastern Slavic social organization has, however, been gravely hampered by the dubious terminology of the mediaeval Russian sources themselves and particularly by the ambiguous use of the word *rod*, which is indiscriminately employed by eleventh and twelfth century texts to mean 'family,' 'clan,' 'tribe,' and even 'nation.' The resulting confusion has accordingly exerted an unfavorable effect upon theories of early Russian social structure ever since this topic first became a subject of study during the first half of the nineteenth century.

In the Laurentian Chronicle, for example, we read, "While the Polyanians were living apart and ruling over their *rodi*, . . . they lived each with his *rod* and on their lands, ruling each over his own *rod* and on his own land."[1] In this passage *rod* can equally well be taken to signify 'patriarchal family,' 'joint family,' or 'clan.' Similarly, a tradition is also preserved by the Chronicle that Kii, the eponymous founder of Kiev, went to settle on the Danube, where "he set up a small town and wished to settle there with his *rod*."[2]

In this instance the same choice of meanings is conceivable. But in the legend of the 'calling' of the Varangians, the Chronicle reports that "there was no justice among them (the Slavs), and *rod* rose against *rod*,"[3] a passage in which any other meaning beside 'clan' or 'tribe' is scarcely applicable. Yet after the death of Kii and his brothers we learn that "their *rod* began to hold the principate (*knjaženie*) among the Polyanians,"[4] so that in this instance the word would seem to apply to their descendants and dynasty. Finally, in the Russo-Greek treaty of 911 the Russian contractants are characterized as "we of the Russian *rod*,"[5] i.e., "of the Russian nation."

Dogmatic interpretation of these obviously vague terms has inspired the creation of unduly exclusive theories of primitive Eastern Slavic social structure. The Dorpat school, founded by J. P. G. Ewers[6] (later followed by S. M. Solovyov), thus held that prior to the arrival of the Varangians in the ninth century the Eastern Slavs lived in small isolated communities composed of clans sprung from the same founder and headed either by their senior member or by an elected chief. As Solovyov remarks, "*Rod* designated the whole complex of grades of kinship, both the nearest and the most remote; it also designated a group of kindred and each one of them."[7] The same school accordingly urged that the formation of the Kievan principality after the arrival of the Varangians was simply the union of a number of large clans, so that the prince was actually the patriarchal head of the resulting combination, and his rule was no more than the administration of a large family created after the model of the smaller units which existed prior to the moment of their coalescence.

In justice to this theory, it must be admitted that in the social forms of the mediaeval historical period elements are found which would indicate that the Eastern Slavs passed through and retained features of the patriarchal phase of evolution. The conception of the patriarchal family as exemplified by the relations prevailing between princes of the Kievan dynasty and the exclusion of daughters from inheritance under old Russian law are factors in point.[8] On the other hand, the prominent role at the dawn of Russian history played by the various larger groups known as tribes (*plemena*), especially in sections of the country where urban centers were late in developing (e.g., among the Derevlians and the Vyatichians), together with the probability that strictly family relationships and connections were subject to serious dislocation once the general movement of Slavic expansion and migration set in, renders it improbable that either the patriarchal family or the clan (in their strictest sense) was still a social unit of general importance among the Eastern Slavs when their cohesion into a state began during the ninth century.

The conclusive evidence in favor of the existence at this period of social units considerably more extensive and inclusive than the patriarchal family and the clan led K. S. Aksakov, the great theorist of the Slavophiles, to the conviction that the stage of existence which

they typify had been passed by the Eastern Slavs at a much earlier period.[9] The Primary Chronicle mentions, in fact, that the various Slavic subdivisions on Russian soil (Polyanians, Derevlians, Dregovichians; the *Slověne* at Novgorod; the Polotsk district) each had principalities of their own before the Varangians appeared on the scene.[10] Rurik, the semi-legendary founder of the Kievan ruling house, is also reported to have been summoned by the Slavs of the Novgorod area (as a unit) in concert with the Finnish Chudes and Merians.[11] Upon their capture of Kiev, the Varangians Askold and Dir ruled over "the land of the Polyanians,"[12] and the various conquests of the early princes of Kiev were invariably directed against tribal complexes which give no evidence of recent parcellation into more primitive social units. From these data, and in view of the diversified connotation of the term *rod* in the sources, Aksakov concluded that by the ninth century all traces of patriarchal structure had vanished among the masses. Where they persisted in the princely house they were (he thought) of foreign origin, and the people were infinitely more interested in a prince's character and energy than in his status of seniority in the ruling family. Aksakov thus considered that the national unity gradually produced by the centripetal policy of the Kievan princes was preceded by a stage during which the Eastern Slavs were grouped into a series of communities (*obščiny*) formed on the basis of the proximity rather than the kinship of their members. The merit of Aksakov's suggestion lies in his postulating an intermediate stage between the dominance of patriarchal relationships and the evolution of a state as such, but this suggestion was not accompanied by any reasoned explanation how this intermediate stage was induced.[13]

The same considerations which led K. S. Aksakov to postulate a period of communal existence and the evidence of the sources as to the existence of isolated pre-Varangian principalities inspired N. I. Kostomarov's[14] notion that groups of clans fused together into tribal unions as a consequence of the normal growth in numbers of the individual clans and the geographical proximity of the latter as the process of colonization and settlement progressed. The existence of

such tribal complexes had never been denied by previous investigators, but their importance had been minimized in comparison with the influence of ties of blood relationship. Indeed, as far as either the tribes (*plemena*) or any previous combinations governed solely by considerations of kinship are concerned, it would seem that the social evolution of the Eastern Slavs by the time they first appear as an historical factor had progressed to a point where neither family nor tribal connection was the chief motive behind the rudimentary federations which were already in existence when the Scandinavian infiltration began. None of the previous theories took into consideration the fact that at the arrival of the Varangians the courses of the chief Russian rivers were already dotted with towns so numerous as to cause the newcomers to name the country *Garðaríki* ('the realm of stockaded towns'). Furthermore, the districts affiliated with these towns did not coincide with the boundaries of the tribal units whose names were still in current use or remembrance. The Slověne of Novgorod acted in conjunction with the Krivichians of Izborsk and the northern Finns, while Chernigov was the center for Radimichians Severians, and Vyatichians. The first Russian theorist to note this fact was V. I. Sergeyevich,[15] who suggested that the primitive towns were the creation of groups of ambitious Slavs or even of representatives of other indigenous races who sought a convenient point for defense or trade, and then proceeded to expand their possessions and influence by the acquisition (peacefully or by violence) of adjacent interesting territory. The territorial subdivisions which existed at the coming of the Varangians did not (in his opinion) rise from the coalescence of previous clan holdings or represent survivals of earlier and well-defined tribal areas, but were a series of completely new spheres of influence resulting from the drift of portions of the latter toward the nuclei which attracted them.

The defects of this theory are occasioned by an inadequately motivated conception of urban origins and by the fact that it represents a stage of development presupposing earlier phases of social organization for which it offers no definition, regardless of the source data which indicate their existence. While it is necessary to concede that a purely patriarchal or tribal organization was a thing of the past in the ninth century, it is unlikely that all its vestiges should have been erased to the extent implied by the system of Sergeyevich. F. I. Leontovich[16] thus admitted the breakdown of these organizations,

and sought among the non-Russian Slavs some social unit which would give a key to the social status of the Eastern Slavs before the creation of the Kievan principate. Leontovich pointed out that an exclusively patriarchal and tribal organization is found only among purely nomadic peoples, but is immediately resolved as soon as such peoples become fixed, in consequence of the necessity of integrating non-kindred elements into the social complex. The originally kindred groups became contaminated with extraneous elements, though still conceived as fictitious clans or tribes. Leontovich thus held that the groups known as *vervi* in the *Russkaya Pravda* were of this type, i.e., artificial clans or tribes of mixed membership in proximity to the most important towns. The patriarchal background is thus conceded, but no thought is entertained of its perpetuation until the opening of the historical period. A parallel to this form of social organization Leontovich found in the Western Serbian *zadruga*.

This characteristic Serbian family community, with analogies in other isolated areas (Switzerland, Tyrol, Spain), is down to the present day the chief type of social organization for the Yugoslav peasant class. As Ernest Denis observed, "On rencontre en realité chez tous les peuples, à un moment donné de leur évolution sociologique, des institutions très analogues à la *zadruga*,"[17] and it is probably true that, like the Indian 'joint family,' the *zadruga* is a survival, not merely of Slavic, but also of common Indo-European antiquity.[18] It consists of a certain number of persons of common descent (sometimes to the fifth generation), together with outsiders who acquire membership by marriage or adoption. The head of the *zadruga* is either its senior member or an elected chief, and the direction may even devolve upon a competent widow. The chief represents the *zadruga* in external relations and directs its economy, though in serious matters he is subject to the group decision of its membership. Usually a patronymic, the name of the *zadruga* is attached to that of each of its members. Collectivity of goods prevails; the whole fortune of a *zadruga*, together with the individual earnings of its members, belongs to the group, and cannot be disposed of without the consent of all its adult and married male constituents. While the membership of a Serbian *zadruga* may rise as high as 60 persons, corresponding survivals noted

Russian historian to accept Leontovich's theory was K. Bestuzhev-Ryumin, *Russk. Ist.*, I (Spb., 1872), 41–53. For the modern *zadruga*, cf. M. Ivsić, *Les problèmes agraires en Yougoslavie* (Paris, 1926), pp. 28–42, with bibliography; more recently P. E. in the Western Ukraine early in the present century did not exceed 25. Documents of the seventeenth century indicate, however, the presence in Galicia, Podolia, and White Russia of settlements known as *dvorišča* which contained as many as 27 households. Though the basis of these aggregations was blood-relationship, the admixture of extraneous elements was considerable, and at least one such *dvorišče* was composed of two families of totally different parentage. Fields, woodland, and similar landed appendages were common property, but the pasturage was particularized.[19]

The term *rod* as used in the Chronicle may thus be viewed as the primitive Eastern Slavic equivalent of the *zadruga:* as Hrushevski defines it, "a family and economic union of a group of people usually connected by blood relationship on the father's side)more rarely, with an admixture of strangers), conducting their economy in common under the direction of their chief, or 'elder,' 'ruling over' this *rod.*"[20] But even though the membership might be mixed, the tradition of kinship was still strong, as is proved by the maintenance of the tradition of family vengeance into the eleventh century.[21]

While a marked dislocation of the primitive family and clan relationships was inevitable during a period of movement, it is also logical that, as new settlements were founded, the families which occupied them should have developed by normal process into clans resembling those which existed before the epoch of dispersion. Hence the evolution of new *rodi* resembling the *zadruga* is equally possible after the Eastern Slavs had sporadically occupied the more remote sections of Russian territory. The persistence of such villages occupied by peasants of a common ancestry in the West Russian provinces well down into historical times is valid proof that such was the case,[22] and the frequency of place names with the patronymic termination *-ichi, -ovichi* lends further support to this hypothesis. The same concept of family relationship also lies behind the formation of the major tribal divisions, however diversified their membership may have become by the ninth century. Among the western Serbs a number of villages or *zadrugi* with remote ties of kinship unite into brotherhoods or tribes with a membership as high as several thousand souls. The presence of the patronymic suffix *-ichi* in Russian tribal names (e.g.,

Radimichi, Vyatichi) indicates that the Russian tribes likewise passed through a stage when membership depended on kinship, though the later attachment of the same suffix to place-names (e.g., *Pskovichi*, *Tverichi*) also proves that its original implication was forgotten before the historical period.[23] Indeed, the tribes mentioned by the Chronicle as existing in the ninth century are too extensive to have retained more than a vague tradition of common genealogy.

The social organization of the Eastern Slavs at the beginning of their history thus contained elements of more primitive groupings: the *dvorišča*, or small rural townships analogous to the *zadruga*, preserved phases of the ancient patriarchal and kindred relationships, while the tribes, long since developed beyond a stage where kinship was the sole criterion of membership, indicate by their names the evolution through which they had passed. The *dvorišče* itself, however, exhibited a tendency to evolve from a family group into a purely social or economic complex under the influence of conditions of settlement and the proximity of non-kindred elements impelled to combination by community of interest. The union of several *dvorišča* of diversified origin produced villages or, rather, agricultural communities in the modern sense of the word, but extending each over a considerable area, with the original *dvorišča* lying in the midst of their communal land. It was such groups which formed the *vervi* mentioned in the *Russkaya Pravda:* not too large to refuse collective responsibility for their members and able to pay wergild for a homicide committed on their land in cases where it was not desirable to surrender the guilty party.[24] In the primitive family, the supreme authority had been vested in the father, whose control over its members was absolute, as is attested by the fact that the words for 'child' and 'slave' (either *rab* or *otrok*) are identical in Old Slavic.[25] In the individual *dvorišče*, similar authority inured to the eldest member of the family group (*starosta*, *stareišina* < *staryĭ*, 'old'). Upon the combination of various *dvorišča* into larger groups, the authority wielded in the smaller units by the individual father or elder was vested in a council of such elders (*starci*), known as a *veče*.[26] Furthermore, while the com-

[26] A consultation of the Kiev elders (*starci*) is thus mentioned in 983 (*PSRL*, i, 1, 2nd ed., col. 82), and a *veče* in Belgorod in 997 (*ibid.*, col. 127). The *veče* persisted even when some leader had succeeded in imposing his authority over a tribe or group of tribes; in Latin sources from the sixth century these tribal chiefs are called *princeps*, *dux*, *regulus*,

munal tenure inherent in the *dvorišče* might persist in sections where agriculture was well established, its hold was likely to weaken as the range of Slavic settlement extended into less occupied areas, so that the conception of property as the possession of the individual family rather than of the larger patriarchal or joint family was promoted by the expansion of the Eastern Slavs along the central Russian watercourses.

Such scattered settlements, regardless of the ties of interest which bound them together, were isolated in vast stretches of primeval forest in which the settlers hunted and collected wild honey. For defence the settlers constructed small palisaded inclosures known as *gorodišča*, in which rudimentary public life and commerce were ultimately concentrated. Sometimes circular, sometimes quadrangular, fortified by a single rampart (occasionally also by a moat) if on level ground, or by concentric ramparts at the most exposed point if placed on a high or otherwise naturally defensible spot, such *gorodišča* are found all through the middle Dnieper basin at intervals of four to eight kilometers, and their frequency depended on the thickness with which a given area was settled.[27] Thus, for example, the Chronicle preserves the legend that Kiĭ and his two brothers each settled at a strategic point on one of the hills of Kiev.[28] However doubtful the legend itself may be, it accurately illustrates the practice of the early Eastern Slavic settlers, and the reputed foundation of a common strong-point named after Kiĭ reflects the function of the *gorodišče* as a place of refuge and a center of defense.

The Eastern Slavic communities of the ninth century were not, however, exclusively rural. The area occupied by the Eastern Slavs was traversed from north to south by the Dnieper, which had been since time immemorial an artery of trade, while its branches not only tapped the hinterland but also approached the upland watersheds beyond which other river routes flowed on to the Baltic and the Volga valley. The primeval significance of the Dnieper as a trade-route is crystallized in the early chronicle account of a "road from the Varangians to the Greeks,"[29] by the existence of which the Dnieprian Slavs were drawn into the currents of mediaeval commerce. In the

sub-regulus, with reference to the Western Slavic tribes, but the title *knjazj* (from West. Germ. *kuning*, and the only term used in O. Russ.) does not appear till the early ninth century. Cf. Niederle, *Manuel*, II, 181, also *Slovanê Zachodní*, p. 105.

eighth century, the Khazars were in a position to control commercial exchanges not only on the lower Dnieper and Don but also up the Volga from the Caspian Sea. As is proved by finds of extensive caches of eighth century coins (Arabic dirhems), the mediaeval development of river-borne commerce in the Kiev area dates from this period and coincides with the growth of commerce under Khazar auspices. Many of the Khazar traders were Jews and Arabs. The situation of Itil, the Khazar capital at the mouth of the Volga, made it a transit station between the Caliphate and the interior of Russia. The traffic between Arabs and Khazars passed over the Caspian, from which boats proceeded up the Volga as far as Bolgary, near the confluence of the Kama, and the Khazars collected a ten per cent transit-tax on goods passing through their capital.[30] Similarly, the tributary relationship of the Dnieprian Slavs to the Khazars opened to the former the paths of commerce to the Black Sea over which, according to Ibn-Khurdadhbih (an Arabic geographer of the ninth century) they exported to Byzantium beaver-pelts, fox-furs, and swords,[31] while slaves were also an important item of this traffic. Under the stimulation of such commercial activity some of the little fortified places (*gorodišča*) originally founded by the Eastern Slavs for defence and security became trading posts (*pogosti*) where merchandise accumulated and where traders foregathered. Those situated at river junctions rapidly outdistanced the interior strong-points, and became the chief urban nuclei. Their economic functions made them politically the county-towns, as it were, of the areas from which their staple articles of trade were drawn. As these towns grew in importance, attracting to themselves ever greater accretions of population, the rise of a wealthy and influential commercial class tended to wipe out survivals of the primitive patriarchal and tribal organizations both in the cities and in the areas closest to them. As is proved, however, by later survivals of agricultural communities in the Western marches of the Ukraine which approximate the older units of *dvorišče* and *rod*, as well as by the archaeological remains testifying to the existence of numerous *gorodišča* within the area of the principality of Kiev itself, such features of earlier social units were coexistent with the growth of city life on a commercial basis both during the period of Khazar domination and well beyond the beginnings of the historical period. But

within the spheres of influence of the towns themselves the town-dwellers, through their commercial interests and broader contact with affairs, became the controlling element to the point where the old *veče*, composed of tribal elders and heads of families, either lost its importance or was replaced altogether by representatives of the new commercial ruling class.[32]

That these numerous budding urban communities were the distinguishing feature of Russian political organization in the ninth century is indicated by the early Scandinavian names for Russia: *í Gorðum*, or *Garðaríki*,[33] the realm of *goroda*, or 'fortified towns.' Of the chief cities at the dawn of Russian history, Polotzk, on the upper Western Dvina, included in its district a portion of both Dregovichians and Krivichians, and owed its importance to the proximity of a portage from Dvina to Dnieper. Smolensk, on the upper Dnieper near portages to Dvina, Lovat, and Volga, was the central point of an area including chiefly Dregovichians, Krivichians, and Radimichians, while the northern portion of the latter, along with most of the Vyatichians, fell under the influence of Chernigov, on the Desna river which joins the Dnieper from the eastward at a point north of Kiev. The city of Kiev itself was in Polyanian territory, but early extended its sphere of influence to north and east over portions of both Derevlians and Severians, though the majority of the latter were more closely attached to Pereyaslavl, southeast of Kiev on the left (east) bank of the Dnieper. Novgorod was the urban center of the Slavs (*Slověne*) and closely related also to the Krivichians about Lake Ilmen, while Rostov (further to the east in the Volga basin), settled largely by men of Novgorod and by Krivichians, was a Slavic outpost on the edge of the Finns on Volga and Oka before the Scandinavian infiltration.

Prior to the evolution of first, a commercial, and subsequently, an official ruling class, the primitive Slavic population was divided into three distinguishable strata. At the lowest point in the social scale stood the slaves, composed of indigenous natives subjected by Slavic colonists, captives taken in war, Slavs who had lost their freedom in consequence of debt, servants purchased in the open market, and descendants of slave parents. At least in their early history, the attitude of the Slavs toward their slaves was exceptionally mild. In the *Strategikon* of Pseudo-Mauricius (sixth century) it is thus remarked,

"Those in captivity among them they do not hold in servitude for an unlimited period, like other nations, but after setting them a fixed term they leave it to their choice whether they wish to return home after paying ransom or remain among them as freemen and friends."[34] In contrast with Roman practice, slaves held under the Slavs were also allowed to own property without limitation and bequeath it to their children,[35] and under Russian usage a man enslaved for debt could work off his obligation and the accrued interest.

Above the slaves stood the great group of freemen, known among the Eastern Slavs as *smerdi*. This term in Russia originally extended to all free elements of the population below the rudimentary aristocracy, but later became restricted to the free agricultural population, living on communal or private land-holdings. Since the communal lands were eventually regarded as the prince's, the free rural population on such lands became the prince's peasants, rendering certain duties but still free,[36] though there are instances where the urban population protected the smerds against the exactions of the prince.

Above the freemen stood an ill-defined class referred to in mediaeval Latin sources dealing with the Western Slavs from the sixth century forward as *primates*, *meliores*, *seniores*. From the last term it would appear that these outstanding individuals were originally the elders (*starosty*, *stareišiny*) of the *rodi* or *zadrugi*, and that with the decline of communal tenure and the decay of purely patriarchal authority certain influential families acquired a conspicuous share of both property and influence.[37] After the evolution of the Russian commercial towns, the mercantile leaders played a conspicuous role in this connection, eventually allying themselves with the immigrant Varangian warrior-merchants who formed the entourage of the Viking princes established in Russian territory.[38]

The Old Russian sources preserve only slight traces of a pre-Varangian aristocracy; for example, in the largely legendary account of Olga's triple revenge upon the Derevlians for the murder of her consort Igor (945) it is reported that Olga requested them to send her a delegation of their 'distinguished' (*naročiti*) men, and that in

compliance with her request "were gathered together the best men who held the land of Dereva."[39] These individuals were viewed as forming the entourage of the prince of Dereva, since they are specifically referred to as a *družina* (escort, suite), the conventional collective term for the escort and councillors of an historical Russian prince of the Kiev period. Nor is there in the Russian sources any evidence of another term for 'chief' beside the imported *knyaz*.[40] While accounts of the primitive Slavs outside Russia show the existence of tribal chieftains governing with the advice of some type of *veče*, there is practically no material from which the character of the administration of the early Russian tribes can be defined beyond the statement of the Chronicle that the various Slavic tribal complexes on Russian soil possessed their own principalities (*knjaženia*) before the arrival of the Varangians.[41]

According to the Laurentian Chronicle, polygamy prevailed among the pagan Eastern Slavs, and together with concubinage it was common to all primitive Slavic subdivisions elsewhere. However, while there is evidence of considerable promiscuity among the primitive Slavs, a sense of the sanctity of marriage as a permanent tie is also demonstrated by early accounts of wives who committed suicide upon the death of their husbands, so that the fidelity of the Slavic women is almost universally commented upon with favor by foreign observers.[42] Survivals of primitive custom among the Russian peasantry down to modern times indicate notwithstanding that great freedom was allowed both sexes prior to marriage.[43] The Slavic women enjoyed no equality in the household, though a surviving widow was authorized to take her husband's place as head of the family. Marriage by capture or by purchase was the common Slavic practice. The Chronicle refers with disapproval to the kidnapping of maidens among the Derevlians, but notes that marriage by purchase was customary among the Polyanians.[43a] In this respect also, the retention of pre-Christian customs among the Russian peasants in recent times like-

[39] *PSRL*, I, i, 2nd ed., 56–57: "sobrašasja lučjsie muži, iže der'jžachu Derevjsku zemlju."

[40] Cf. n. 26 *supra*. This term can hardly be of Gothic origin, since the Goths show no evidence of having used it; furthermore, since it is first applied with respect to West-Slavic tribes in the early ninth century, it cannot have been borrowed into Old Russian from Old Norse *konungr*, the more so since the nasal in the primitive Slavic form (*kŭnędzĭ*) points conclusively to a suffix *-ing* in the Germanic original, which can only have been a West-Germanic *kuning*, *chuninc*.

wise points to the coexistence of these two types of marriage, and reflexes of marriage by capture were particularly common among the Schismatics (Old-Believers) before the Revolution.[44]

From the standpoint of material culture, the Eastern Slavs at the dawn of their history in the ninth century had been exposed for more than a millennium to a series of foreign influences, so that much of the technique which they possessed was not uniquely Slavic, but common to all adjacent ethnic groups of equivalent culture. By the arrival of the Varangians at this epoch, they had passed, at any rate, far beyond rudimentary communism and nomadic agriculture to a system of private property rights, and were exchanging the products of their domestic industries and trades, either by barter or against cash payments, with itinerant merchants of Oriental origin, or even transporting these products themselves to the markets of the Black Sea coast.

Linguistic evidence demonstrates that the mass of the Slavs, like the German and the Baltic peoples, was familiar with iron, gold, silver and lead from the earliest times, i.e., at least from the second half of the first millennium B. C., and therefore prior to their dispersion. The names for gold and silver are indeed identical in all three linguistic branches, while those for iron and lead are common to both Baltic and Slavic, though differing from the German vocable. The common Slavic term for copper has no cognate of equivalent meaning in either the Baltic or the Germanic languages. The Slavic word for ore (*ruda*) likewise has no parallel in Baltic.[45] Since iron became known on the coast of the Black Sea about 900 B. C., and appears in archaeological finds from the Kuban district fully two centuries before that date, the early transmission of iron technique to the Slavs is beyond question, particularly in view of traces of iron-mining and smelting in Poland and Bohemia even in the pre-Roman epoch.[46] Iron

[44] Zelenin, *op. cit.*, pp. 318–319.

[45] Gold: Goth. *gulp*, Lettish *žèlts* (Lith. adj. *želtas*), Slav. *zlato* (all from indoeur. base **ĝhel-*, 'shine, yellow'). Silver: Goth. *silubr*, Lith. *sidabras*, Slav. *sŭrebo* (derivation uncertain, but probably not indoeuropean). Iron: Lith. *geležis*, Slav. *želězo* (regarded as connected with Gk. χαλκός, 'copper, bronze' and probably a loan-word of Near-Eastern, perhaps Pontic, origin, cf. Walde-Pokorny, *Etym. Wtb.*, I, 629; the variation in meaning is not impossible if one accepts the derivation of Lat. *aes*, Go. *eisarn* from the base **aios-*, 'metal, either bronze, copper, or iron'). Copper: common Slavic *mědĭ*, and without demonstrable indoeur. relations apart (perhaps) from the base **mai-*, 'cut, work with a sharp instrument' (*ibid.*, II, 222). Lead: Lith. *ālavas* 'tin,' Slav. *olovo* 'lead'; however, in view of the correspondence of Lith. *ālavas* in form and meaning with Russian *olovo* 'tin,' there is at least a possibility that the former is borrowed from the latter, and if any indoeur. background is possible, the base is **albho-* 'white,' cf. Gk. ἀλωφός (*ibid.*, I, 93–94). Ore: Slav. *ruda* (from indoeur. base **reudh-*, 'red') has a Germanic parallel in ON *rauðr*, 'bog iron ore.'

cauldrons are thus found in Russian tombs of the pagan period, while iron and steel arms were a favorite importation from Scandinavia before the Russian smiths could produce them themselves. Though the Southern and Western Slavs had considerable silver deposits in their territory, the silver which is the chief material of the jewelry discovered in Russian tombs at the close of the pagan period (e.g., in tombs of the Derevlian district, 72 percent of the ornaments found are silver) shows the filigree technique characteristic of the Near East, and is almost wholly imported.[47] Similarly, there was no gold in the territory originally occupied by the Eastern Slavs (though they were later able to procure it from the Urals, the Altai, and Siberia), and goldsmiths do not appear in Russia itself before the tenth century. Though the finest gold and silver objects discovered which belong to this period are of Greek and Oriental workmanship (especially bowls, goblets, and pitchers, and the better types of jewelry), there are also extant numerous articles (necklaces, bracelets, rings, earrings, and temporal rings) which are either imitations of foreign articles or products of domestic design and craftsmanship, including reproductions of Byzantine enamels.[48]

In ceramics as in metal-working, the Slavs were imitators rather than pioneers. Slavic pottery of the close of the pagan period consists of well turned and fired vases in the form of pots without handles, showing a somewhat flattened lip and ornamented, sometimes with a wavy line several times repeated, sometimes with simple horizontal stripes, and occasionally with vertical or transverse stripes or simply a series of dots in oblique lines. The potter's mark usually occurs on the base. This species of pottery, conventionally known as the *Burgwalltypus*, from its being so often found among the remains of small Slavic *gorodišča* not only in Russia but also at the extreme western European limits of Slavic settlement, is literally scattered all over Slavic territory from the Elbe to the Volga. There is, however, nothing specifically Slavic about its technique, since it is a reproduction of the Roman vase with undulating ornament familiar in the northernmost Roman provinces between Danube and Rhine from the first to the fourth century A.D. The Slavs thus seem to have had some contact with the northern Roman markets in this interval, and gradually to have adopted the new type of pottery in preference to their own previous products of this character: high vases, or lower bowls without a flattened edge and decorated either with horizontal stripes

or rows of oblique lines, i.e., types developed independently of Roman influence.[49] All pre-Christian glass and glazed ware (goblets, bottles) was imported, since the technique of glass manufacture and of glazing both pottery and the cubes (*tesserae*) used in mosaic was not introduced into Kievan Russia until the establishment of closer relations with Byzantium during the last decade of the tenth century. Larger receptacles (pails, buckets) were made of wood bound with iron hoops and lifted by a movable handle.

Among the chief domestic industries were spinning and weaving. While rich silks were an article of import attainable only by the wealthy, the masses were clothed in homespun fabrics prepared from wool, flax, and hemp. Since the early Slavs were not expert bleachers, the resulting fabrics were mostly grayish in color, and all finely dyed fabrics even in the historical period were thus imported merchandise. Not only is general terminology of spinning and weaving throughout the Slavic languages so homogeneous as to show that this technique was a matter of common knowledge before the dispersion began, but the absence of foreign borrowings also proves it to have been a native development of very early date. It is significant that this vocabulary was taken over bodily by the Magyars upon their settlement in Central Europe.[50]

Just as the pagan Slavs by the ninth century had attained a respectable technique in metal-working, textiles, and ceramics (acquired in part from their neighbors), there is likewise abundant evidence that at an early stage of their existence they also possessed a knowledge of agriculture considerably in advance of what is attributed to them in this connection by frequently cited historical sources. The content of the general Slavic vocabulary with respect both to agriculture and to cattle-raising is in itself sufficient to vitiate any conception of the Slavs at the dawn of their history as a race of agricultural nomads leading a precarious and unstable life on scanty fare. Nor is there a sufficient number of loan-words in the Slavic vocabulary of these occupations to indicate that any appreciable proportion of the knowledge of agricultural products or livestock which

[49] *Ibid.*, pp. 302–323; *Manuel*, II, 225–229.

[50] For details of early Slavic methods of spinning and weaving, as well as a description of the primitive Slavic upright loom, cf. Niederle, *Živ. star. Slov.*, III, i, 338–342, and on the Magyar vocabulary, cf. F. Miklosich, 'Die slavischen Elemente im Magyarischen,' *Denkschriften der Wiener Akademie*, phil-hist. Kl., XXI (1872), 15. The extent of Roman or other western influence in the development of Slavic textile technique is difficult to define; Niederle (*ibid.*, pp. 341–342) admits the possibility of this influence, and in later times even Charlemagne's interest in the textile trades is a matter of history.

the Slavs possessed was the result of contacts with other ethnic units of more advanced material culture. Early mediaeval sources (especially Byzantine) which represent the Slavs as nomads poorly clad and fed should thus be taken as referring to their economic status during the uncertain period of migration rather than to their mode of existence and means of livelihood either before their expansion occurred or after its most acute phase had come to a close.

These sources are frequently contradictory. In the late ninth century, for example, the *Tactica* attributed to Leo the Wise assert that the Slavs "used to live on millet, and preferred moderation, since they resented other labors of farming, inasmuch as they were attached to a freer mode of life without labor rather than to a luxurious regime of plenty bought at the price of intense effort,"[51] and fifty years later Constantine Porphyrogenitus declares that the Slavs in Russia had no domestic animals and were obliged to purchase those they used from the Pechenegs.[52] On the other hand, the pseudo-Mauricius, to which Leo's text is heavily indebted, mentions that in the late sixth century the Slavs held large accumulated stocks of grain which it is fair to suppose they raised themselves.[53] Ibn Rosteh, an Arabic observer contemporary with Leo, particularly mentions the Slavs in Russia as habitual raisers of sheep and swine, and cultivators of millet,[54] while a Jewish traveller of the tenth century (Ibrahim-Ibn Yaqub) declares that the western Slavs practiced agriculture more zealously than any other nation.[55]

The common Slavic vocabulary shows that as feed-grains the primitive Slavs knew barley, wheat, millet, rye, and oats; among fruits they knew apples, pears, cherries, and plums, and of vegetables they consumed peas, beans, lentils, onions, garlic and beets. Flax and hemp were familiar textile fibers. Among domestic animals, the common Slavic vocabulary includes homogeneous terms for horse, cow, bull, steer, sheep, goat, pig, and dog, and among domestic fowl, for ducks, geese, chickens, and pigeons.[56] In these phases of culture the

[56] For a full treatment of the Slavic terminology in this field, see Hrushevsky, *Kievskaja Rusj*, I, 300–306, 309–315. Grape-culture was unknown to the Slavs until they borrowed it from the Goths. The Germans themselves derived it from the south after the migrations (Kauffmann, *Deutsche Altertumskunde*, II, 205), and the Slavic terms, *vino*, *vinograd*, Goth., *wein*, *weinagards*, indicate the course of further transmission. The fig was also introduced by the Goths (Goth. *smakka*, Slav. *smoky*), though presumably an article of importation from the Black Sea coast.

primitive Slavs were in no essential respect inferior to the primitive Germans, who were frequently their teachers in improved technique, especially during the Carolingian period. As Šafarík remarked nearly a century ago, the predilection of the Slavs for agriculture is the natural consequence of their long residence in the European districts best suited for its practice: the plains of the Dnieper and the Vistula.[57] In the light of the evidence of the Slavic vocabulary, Niederle's view that prior to their dispersion the Slavs were only semi-nomadic husbandmen living more by hunting, fishing, bee-keeping and cattle-raising is not necessarily final. While this authority also considers the primitive habitat of the Slavs (the Polesie and western Russia) ill-adapted to husbandry,[58] this opinion is obviously in direct contradiction to that of Šafarík just quoted, and there is no reason to suppose that the region between the northern slopes of the Carpathians and the Pripet marshes, wherever it was cleared for agriculture, was any less fertile in the early Middle Ages than at the present day. It is probable, in any case, that the epoch of the migrations and of the repeated nomad incursions from Asia, beginning with the Huns in the fourth century, interrupted the sedentary tendencies and habits which the Slavs had previously developed. By the ninth century, however, the Eastern Slavs had largely returned to their earlier agricultural pursuits except in the northeastern districts more recently and sparsely colonized, where hunting and trapping were the natural resource of the pioneer in uncharted forests. In later times this region also was put into grain and provided the food-supply of Novgorod.

The primitive plow of the Slavs, as of the Germans prior to the migrations, was at first only a forked branch with one fork lopped short and cut into a point. This type of plow, drawn by two oxen, was in use as late as the tenth century, though by that period the primitive implement was also supplemented by a pole to which the draft-animals could be attached and by a handle with which the driver could guide its course. The share itself was then made of iron with a pinch into which the handle could be inserted. Other types are extant consisting of a heavy base-beam sliding along the furrow; to the front of this beam an iron share was attached, while the driving handle rose from the rear of this beam; the drawing pole was then fixed to the handle and braced to the sliding base-beam. The more complex plow, with coulter and primitive mould-board, was a Roman invention and did not reach the Slavs before the time of Charlemagne or even later; in fact, archaeology has not discovered a plow of this type in

Slavic territory older than the thirteenth century, and the fact that its Slavic name is *plug*, as compared with *ralo*, *radlo*, the name of the primitive implement, is sufficient evidence that it reached the Slavs by German transmission, and long after the migrations.[59]

The Slavs at the close of the pagan period were practicing the three-field system of culture familiar from the German and Roman usage, in which wheat or rye was sown on one field in the autumn of the first year, then oats or barley in the spring of the second, and finally the field was left fallow during the third season. This system is a matter of record for the Western Slavs in the tenth century. The conclusion that it prevailed elsewhere as well is justified by the common Slavic terminology for spring and winter cereals, and there is specific mention of the practice in Russian sources of the twelfth century. As the three-field system went into use in Western Europe not earlier than the eighth century, its adoption among the Slavs can date only from Carolingian times.[60]

The prevalence of bee-keeping among the Eastern Slavs was noticed by Arabic travellers of the early tenth century (who even reported the O. Russian term for 'hive,' *ulei*),[61] and the Slavic vocabulary again indicates the early origin of this occupation. The honey was used for brewing mead, the chief intoxicating drink of the early Russians, and the wax was exported, along with furs supplied by native trappers (chiefly beaver, sable, fox, and squirrel).

The aspect of the Slavic village even in early historical times was extremely simple. There is no trace among the Eastern Slavs of the round village so common in the Elbe basin; on the contrary, the cottages were either scattered throughout the extent of the *dvorišče* in proximity to the fields of their occupants, or, if gathered into one neighborhood, strung out on either side of the path or road which formed the main thoroughfare. Stone buildings were unknown, and are mentioned as exceptional even in the early Varangian period. One early type of house consisted of a trench dug in the ground, the sides of which were raised by walls of logs stopped with earth; the wooden roof was also coated with earth as an additional protection. Recent archaeological discoveries in the vicinity of Kiev and belonging to the epoch of the *gorodišča* demonstrate, however, that at the beginning of the historical period the Eastern Slavic house had de-

[59] For illustrations of these types of plows, cf. *Manuel*, II, 186–192.

[60] Niederle, *Živ. star. Slov.*, III, 30–32. The common terms for spring and fall sowings are *jar*, *jarina*, and *ozim*, *ozimina*. Frosts killing the *ozimicy* 'fall-sowings' around Novgorod are mentioned in 1126 (*Synodal Codex*, p. 124), with resultant scarcity and high prices on rye.

[61] Chvolson, *op. cit.*, pp. 28–29.

veloped beyond this humble norm. These Kievan houses show an unheated entrance hall or inclosed porch (*sen'*, *pritvor*), which later develops into a reception room, and then receives a porch of its own as an additional appendage. The main room back of the *pritvor* contained at first an open fire, later a hearth, an arrangement once more indicating German influence, possibly even before the Carolingian epoch. The Eastern Slavic houses frequently show a separate shed used as a storehouse or barn (*klet'*), sometimes with a second story intended for a granary; the *klet'* was eventually joined to the house as a third room, though the two-room type is basic. The evolution of a second story for the whole house first takes place in Northern Russia and is attributed to later Varangian influence.[62] The use of small sheds as bathing-houses in which steam was produced by pouring water over heated stones or a hearth is also attested for Russia of the pagan period.

The costume of the men among the pagan Eastern Slavs at the moment of the Varangian infiltration consisted of a coarse shirt made of hemp or flax and falling to the knee, with sleeves and an opening for the neck, combined with tight trousers supported at the waist by a belt of rope or leather and tied in at the ankles. For the shirt was sometimes substituted a short tunic, frequently embroidered like the modern Russian *rubakha*. The tunic might be either of light material or else of coarse wool, in which case it could be worn over the shirt. There existed a considerable variety of these heavier outer garments, sometimes falling below the knee, fastened at the throat with buckles, frogs, or buttons, and belted in at the waist. The long coat, or caftan, was a characteristic feature of Eastern Slavic garb. It might be trimmed or even lined with fur, though the common people ordinarily used sheepskins or the cheaper pelts (bear, wolf) for protection against the cold. A cloak buckled at the right shoulder might also be worn over the caftan. Upon closer contact with the Orient and with Byzantium, more expensive fabrics and styles borrowed from foreign costumes were frequently affected by the wealthier classes; the ruling house in historical times thus adopted the garb of the Byzantine aristocracy. Women of the people were clad in a long shirt of rough linen or hempen material, often representing merely a cylinder of fabric held up by straps over the shoulders. From the waist down they also wore a double apron attached to a belt, while the upper part of the body might be clad in a coarse woolen jacket, along with a cloak of similar material around the neck and shoulders. Footwear

consisted of rough leather slippers held by a strap over the ankle or of slippers made of warm bast fiber. Leather slippers split down the instep and provided with eyelets for laces have also been found in Kievan tombs. Leather boots were likewise worn by the more prosperous classes, and both woolen stockings and socks are attested in Russia at an early date. The usual male headgear was a high felt hat, sometimes with a narrow brim, or a type of beret edged with fur. Married women might wear a kerchief or bonnet on their heads, over hair cut short, but maidens habitually went bareheaded, wearing their hair braided and long. Men also wore their hair long; the beard might be trimmed or shaven, but moustaches were common.[63] None of these features of attire or personal appearance can be regarded as specifically Slavic, in view of the facility with which foreign usage is absorbed in matters of material culture.

Originally a peaceful race, the primitive Slavs were unskilled in the use of weapons, and at the time of their dispersion commanded no offensive equipment except bows and spears, being unprotected even by the most elementary shields. Such was their armament as known to Procopius early in the sixth century,[64] and by its close the Pseudo-Mauricius could add only that they used poisoned arrows and carried two spears, while some individuals were equipped with shields too heavy for rapid movement.[65] The constant warfare of the migratory epoch and the necessity of defense against successive nomad incursions across the steppes produced in the succeeding centuries a marked amplification of Slavic military equipment which is especially noticeable during Carolingian times, after which the German and Frankish influence is supplemented by imitation not only of the well-equipped Scandinavian pioneers who scouted the Russian waterways during the ninth century, but also of the nomads against whom the Slavs were forced to fight. As a result, the Slavic terminology for this improved equipment is very largely foreign: the names for sword (*meč'*) and helmet (*šelm*) were thus derived from the Goths (*mēkeis*, *hilms*). The primitive German sword was single-edged, but during the first century A.D. the Germans were themselves using the Gallo-Roman type of double-edged weapon which must thus have become known to the Slavs even before the Merovingian period.[66] Most of the swords of the later pagan age found on Russian territory

are, however, imported articles with German ornament; the single-edged curved sabre is an implement borrowed from the Orient in early historical times, i.e., ninth or tenth century. The Russians also used a one-edged axe with flaring blade, closely resembling the Scandinavian arm of the same type. Armor was not employed by the Slavs till the Carolingian epoch; the term *brunja* (OHG *brunja*, *brunna*) is found in the Primary Chronicle (*anno* 968), and the Frankish origin of this protection is indicated by Charlemagne's Cartulary of Thionville (805) which prohibited the sale of arms and armor to the border Slavs.[67] The customary form was chain-mail falling to the knee, as exemplified by finds in Russian tombs. Metallic helmets of this period were either rounded or pointed at the crest (like oriental models), with or without nose-guard.[68] The early Russian shield was round, strapped with iron, and without a boss. Under the circumstances the armament of the Russian Slavs at the dawn of their history thus represents a fusion of borrowed techniques which placed the equipment of their best-armed men substantially on a par with that of their civilized neighbors. Because of the imported character of much of this equipment, however, it would seem unlikely that the Russian Slavs at the beginning of the ninth century could have placed in the field a heavy armed force of any size. On the other hand, since the Varangians of Kiev sent against Constantinople in 860 an expedition of not less than 3000 men,[69] the opinion is justified that the chief mercantile towns, even before the Varangian period, possessed defensive troops of well-armed militia, though the outlying peasantry and hunters were still using the spears and arrows which were the traditional weapons of the Slavs. The Eastern Slavs made no extensive use of cavalry before the tenth century, and even then enrolled friendly nomads from the steppe country for this purpose.

The chief avenue by which foreign cultural influences in general

[67] *MGH.*, LL., II, i, 122: "De negotiatoribus, qui partibus Sclavorum et Avarorum pergunt . . . ut arma et brunias non ducant ad venundandum. Quod si inventi fuerint portantes, ut omnis substantia eorum auferatur ab eis."

[68] For illustrations of this armament, cf. Niederle, *ibid.*, III, figg. 133–158, or more conveniently) *Manuel*, II, figg. 103–119.

[69] At a conservative estimate. The expedition comprised two hundred ships (cf. Bury, *East. Rom. Emp.*, p. 419, n. 1, on the sources). Though the Greeks called the Russian barges *monoxyla*, 'dug-outs,' it is not to be supposed that the craft that skirted 500 miles of Black Sea coastline even in June were mere canoes. Even before the Viking period, the Scandinavians were building 50-foot boats of 9-foot beam which carried at least 20 people (cf. T. D. Kendrick, *A History of the Vikings* [New York, 1930], p. 24). In any case, no student of the subject has ever contended that there were anywhere near 5000 Varangians at Kiev in the days of Askold and Dir.

reached the Eastern Slavs from the earliest times was supplied by commerce. The most ancient trade-route in Russian territory is the Volga, which was used at least from the second century A.D. for the northward transport of oriental and western merchandise. Roman objects of the first and second centuries A.D. found in Eastern Russia and Western Siberia probably reached these areas from the Bosporan kingdom.[70] When the Goths invaded southern Russia, they gained that control of trade throughout the Dnieper basin which had previously belonged to the Bosporans, and for a time maintained the same commercial relations with the Roman Empire which had been established earlier by German settlements along its northern frontier further westward. Caches of Roman coins, dating chiefly from the interval between Trajan and Septimius Severus (98–198 A.D.), which have been found in great profusion on the west bank of the middle Dnieper and on its eastern shore as far east as the upper course of the Don, show a remarkable expansion of trade with the Roman west in this area during the second and third centuries, and therefore both under the Gothic hegemony and prior to the Slavic dispersion. In view of the complete absence of Bosporan coins, this commerce cannot have passed through the Strait of Kerch. The capture by the Goths of the Greek cities of Olbia and Tyras about 270 A.D. also indicates their interest in making direct contact with the chief commercial centers of the Black Sea area. Once the Goths had thus entered into relations with Byzantium and the Greek cities on the south shore of the Black Sea, their interest in trade with the western section of the Roman Empire waned, and upon the consequent decline of Roman traffic with the Dnieper basin during the fourth century, a new commercial current appeared, bringing to the Dnieprian Slavs simultaneously not only artistic products of the so-called Gothic type from the barbarized Pontic workshops, but also articles of Prusso-Lithuanian and Norse workmanship.[70] Discoveries on the Kama and Vyatka rivers of silver vessels dating from the sixth century forward also indicate that the Volga Bulgars and the interior Finns likewise began to enjoy fresh indirect traffic with the Orient. Iranian silver coin of the fourth century is also found among the Chuds and Bulgars, though the numismatic evidence would indicate that the volume of this trade did not approach that which passed to this area through the Cimmerian Bosporus in earlier times.[71] As long as the Goths lived among the Slavs, they exerted a direct economic influence upon them, but once they had withdrawn to the seacoast after the fall of Erma-

naric, they ceased to be a significant commercial factor, and even when Byzantine trade set in during the fifth century, its volume was so restricted that from this period to the eighth century, when intensified Arab and Scandinavian commerce becomes conspicuous, there is actually an interval in which the economic relations of the Dnieper valley with the rest of the early mediaeval world were in abeyance.[72]

This interval coincides with the epoch of Slavic migration and dispersion. Its conclusion is marked in turn by the stabilization of the Slavs on the Elbe and the Danube, and in the Balkans the temporary elimination of nomadic invaders from the steppes, the economic advance of the Carolingian period, the beginnings of the Viking Age, and the establishment of Arab control over oriental commerce. The period from 700 to 1000, though initiating the gradual withdrawal of the Western Slavs from the Elbe frontier under German pressure, also saw the evolution of all the mediaeval Slavic states and their advance to the level of contemporary material and intellectual culture which culminates in their conversion to Christianity under Roman or Constantinopolitan auspices. It likewise witnessed an expansion of trade both in Central Europe and with the Orient; in this commercial expansion the Eastern Slavs were intimately concerned.

The evidence of Abbasid coins found not only along the upper Volga on the route to Scandinavia but also in the vicinity of Kiev indicates that Arabic trade both to Western and to Eastern Russia began to attain respectable proportions about 800.[73] Traces of Scandinavian penetration into Northern Russia by Lake Ladoga and the Volkhov river date from the same epoch, which is also the period in which both Byzantine and oriental objects and coins begin to appear in Sweden, so that there can be no question but that direct communication between Sweden and the Caspian via the Volga was opened about this date.[74] The importance of Frankish trade with the Western Slavs at the same time is reflected in Charlemagne's Cartulary of Thionville, to which reference has already been made.[75]

The articles exported by the Eastern Slavs were largely the products of their rudimentary industries: furs, honey and wax, grain, salted and smoked fish. These staples were largely bartered for weapons, jewelry, beads, glassware, perfumes, silk, and luxury articles in general, though the omnipresence of coin shows that sales against cash were also current by the eighth century. While slaves had not

played a large part in the primitive Slavic social economy, they became an important item of commerce at the close of the pagan period, and were sold chiefly to the Orient. Apart from the internal trade routes of Volga and Dnieper, communication between Russia and Central Europe went over the Carpathian passes to the Danube valley, while the route from Kiev into Galicia was particularly important for the Russian salt supply, which depended entirely on the Galician mines east of Cracow.[76]

As has been observed, the primitive basis of Eastern Slavic commercial exchanges was barter,[77] and even in historical times taxes, tribute, subsidies, and individual wealth were still frequently reckoned in furs or cloth, the most valuable staple of contemporary commerce. While coins were far from unknown in pagan times, they may well have been valued fully as much for purposes of personal adornment as for their purchasing power. From the fifth century Byzantine gold *solidi* appear in the Dnieper valley, and it has been estimated that the number of silver dirhems left in Russia after the rise of Arabic trade at the beginning of the ninth century must run into the millions if the number and amount of caches discovered all over the country is any criterion. If is significant, however, that while Roman coins were well-known during the Gothic period, the common early Slavic terms for various coins are not of Roman but Germanic origin, from which it may be concluded that at this stage the Gothic economic influence was dominant. At the same time, the presence of later borrowings of coin-names from West-Germanic also indicates the importance of Slavic economic contacts with other German elements before the Carolingian period. For example, the Greek *denarion* (Lat. *denarius*) is rendered either by *cęta* [=tsinta], from Gothic *kintus* 'farthing,' or by *pěnędzĭ* (also common to all Slavic languages and cognate with *penny*); there is no recorded Gothic original for this word, which thus seems to be a borrowing of West-Germanic *penning*. Though the Slavic *skŭlędzĭ* may be derived from Gothic *skilliggs* 'shilling,' which appears, not in Ulfilas, but only once in the so-called Arezzo papyrus,[78] the temptation is great to attribute this word also to a West-Germanic original. While imitations of Oriental coins appear in Russia during the pagan period, actual coinage did not begin in Russia until the reign of Vladimir I, *ca.* 1000 A.D. Prior to the introduction of coinage, the unit of value

in late pagan Russia was the silver *grivna*, a lump of silver usually cast in an elongated hexagonal shape and equivalent in weight to the so-called Kufic (Irak) pound of 408 grams, though this weight is by no means constant.[79]

Though a combined evaluation of linguistic, source, and archaeological evidence permits a tolerably accurate and inclusive definition of the material culture of the Eastern Slavs toward the close of the pagan period, there is no such coherent mass of data upon which any wholly satisfactory statement of their religious beliefs, demonology, and eschatology can be predicated. The references to Slavic paganism in the early sources are, in fact, so scanty as to give rise in this field to a series of conjectures of which the value is inversely proportionate to their originality. When the basic information is so limited, there is no excuse for proceeding beyond the evidence of the sources except insofar as linguistics, toponymics, and early folklore contribute to its amplification.

The primary source materials on the Eastern Slavic gods are so brief as to permit their reproduction practically in full. Procopius remarks of the Slavs: "They believe that one god, the maker of the lightning, is alone lord of all things, and they sacrifice to him cattle and all other victims; but as for fate, they neither know it nor do they in any wise admit that it has any power among men, but whenever death stands close before them, either stricken with sickness or beginning a war, they announce that, if they escape, they will straightway make a sacrifice in return for their lives; and if they do escape they sacrifice what they have promised, and consider that their safety has been bought with this same sacrifice. They likewise revere, however, rivers, nymphs, and some other spirits, and they sacrifice to all these, and make their divinations in these sacrifices."[80] With reference to the Greco-Russian treaty of 907, the Primary Chronicle reports: "According to the religion of the Russes, the latter [Oleg and his followers] swore by their weapons and by their god Perun, as well as

[79] Niederle, *op. cit.*, pp. 470–471; on weights of the Viking period generally cf. Arne, *op. cit.*, pp. 176–196. The Kufic pound contained 96 *zolotniki*, and the silver dirhem weighed 2/3 of a *zolotnik:* Vladimir's silver unit was based by weight on the dirhem, and gave 144 silver pieces to a *grivna* (*ibid.*, p. 196).

[80] *Bell. Goth.*, III, xiv, 23–24 (Loeb ed., IV, 270–271): Θεὸν μὲν γὰρ ἕνα τὸν τῆς ἀστραπῆς δημιουργὸν ἁπάντων κύριον μόνον αὐτὸν νομίζουσιν εἶναι, καὶ θύουσιν αὐτῷ βόας τε καὶ ἱερεῖα πάντα. Εἱμαρμένην δὲ οὔτε ἴσασιν οὔτε ἄλλως ὁμολογοῦσιν ἔν γε ἀνθρώποις ροπήν τινα ἔχειν, ἀλλ' ἐπειδὰν αὐτοῖς ἐν ποσὶν ἤδη ὁ θάνατος εἴη ἢ νόσῳ ἀλοῦσιν ἢ εἰς πόλεμον καθισταμένοις, ἐπαγγέλλονται μέν, ἢν διαφύγωσι, θυσίαν ἀντὶ τῆς ψυχῆς αὐτίκα ποιήσειν, διαφυγόντες δὲ θύουσιν ὅπερ ὑπέσχοντο, καὶ οἴονται τὴν σωτηρίαν ταύτης δὴ τῆς θυσίας αὐτῆς ἐωνῆσθαι. Σέβουσι μέντοι καὶ ποταμούς τε καὶ νύμφας καὶ ἄλλα ἄττα δαιμόνια, καὶ θύουσι καὶ αὐτοῖς ἅπασι, τάς τε μαντείας ἐν ταύταις δὴ ταῖς θυσίαις ποιοῦνται.

by Volos, the god of cattle, and thus confirmed the treaty."[81] According to the same source, the Greco-Russian treaty of 944 contains the provision: "If any of the princes or any Russian subject, whether Christian or non-Christian, violates the terms of this instrument, he shall merit death by his own weapons and be accursed of God and of Perun because he violated his oath."[82] Similarly, when this treaty was ratified in Kiev, the procedure (in the words of the Chronicle) was as follows: "In the morning Igor summoned the envoys, and went to a hill on which there was a statue of Perun. The Russes laid down their weapons, their shields, and their gold ornaments, and Igor and his people took oath (at least, such as were pagans)."[83] The treaty of 971 between Svyatoslav of Kiev and John Tzimisces also contains the asseveration, "If we fail in the observance of any of the aforesaid stipulations . . . , may we be accursed of the God in whom we believe, namely, of Perun and of Volos, the god of flocks."[83a] Then in 978, after Vladimir had gained control of Kiev, "he set up idols on the hill outside the castle with the hall: one of Perun, made of wood with a head of silver and a mustache of gold, and others of Khors, Dazhbog, Stribog, Simargl, and Mokosh. The people sacrificed to them, calling them gods, and brought their sons and daughters to sacrifice them to these devils."[84] After his conversion, Vladimir "ordered that Perun should be tied to a horse's tail and dragged down the hill along Borichev to the creek [Pochaina]. He appointed twelve men to beat the idol with sticks, not because he thought the wood was sensitive, but to affront the demon."[85] Another eleventh-century source, the *Eulogy* of Vladimir attributed to the Monk James, writes of him, "He overthrew Perun and Khors and many

[81] Cross, *The Russian Primary Chronicle*, p. 151; *PSRL*, I, ii ed., 32: "po russkomu zakonu kljašasja oružjem svoim i Perunom bogom svojim i Volosom skotiem bogom i utverdiša mir."

[82] Cross, *op. cit.*, p. 163; *PSRL*, I, ii, 53: "ašče li že kto ot knjazj ili ot ljudii russkich, li chrestejan, ili ne chrestejan, prestupitj se, eže estj pisano na charatji sei, budetj dostoin svoim oružjem umreti, i da budetj kljat ot Boga i ot Peruna, jako prestupi svoju kljatvu."

[83] Cross, *ibid.*; *PSRL*, I, ii, 54: "zautra prizva Igor sly i pride na cholm kde stojaše Perun; i pokladoša oružje svoe i šit i zoloto; i chodi Igor rotě i ljudi ego eliko poganych Rusi."

[83a] Cross, *op. cit.*, p. 176; *PSRL*, I, ii, 73: "ašče li ot tech preže rečenych ne sochranim . . . , da iměem kljatvu ot boga, v ego ze věrujem, v Peruna i v Volosa skotija boga."

[84] Cross, *op. cit.*, p. 180; *PSRL*, I, ii, 79: "i postavi kumiry na cholmu vně dvora teremnago: Peruna drevjana a glavu ego srebrenu a us zlat; i Khŭrsa, Dažjboga, i Striboga, i Simarjgla i Mokosj; i žrjachu im naričjušče ja bogy, i privozachu syny svoja dsčeri i žrjachu běsom."

[85] Cross, *op. cit.*, p. 204; *PSRL*, I, ii, 116: "Peruna ze povelě privjazati konevi k chvostu i vlešči s gory po Boričevu na Ručai. 12 muža pristavi teti žezljiem, se že ne jako drevu čjujuščju, no na poruganje běsu."

others, and destroyed idols, and cast out all godless deceit."[86] It is likewise reported that Joachim, the first bishop of Novgorod, upon his arrival at that city, "tore down the pagan altars, cut Perun to pieces, and gave orders to cast him into the Volkhov."[87]

In addition to these annalistic items, similar evidence regarding Eastern Slavic deities is also preserved in various Old Russian apocryphal and devotional texts. Since the latter are for the most part translations or compilations from the Greek, any enumerations of Russian pagan deities which such translations contain must obviously be glosses. On the other hand, if the Old Russian texts themselves are demonstrably of an age comparable with that of the *Primary Chronicle*, the glosses possess a value by no means inferior to that of the latter. For example, in a translation of the Greek legend of *The Virgin's Harrowing of Hell* (the earliest Old-Russ. text of which occurs in a twelfth-century manuscript), where reference is made to human belief in idols, the names of Khors, Veles, and Perun have been inserted.[88] Similarly, in the Old Russian *Discourse on How the Gentiles, being Pagans, first worshipped Idols*, based on a translation (earlier than the eleventh century) of a sermon of Gregory Nazianzen, we read that the Slavs "after holy baptism cast out Perun, and took after Christ our God, but even today in the country districts they pray to him, the accursed god Perun, and to Khors, and Mokosh . . . and cannot rid themselves of the accursed setting of the second table for Rod and the Rozhanitsi."[89] Similarly, in the so-called *Discourse of a Certain Lover of Christ* (earlier than the fourteenth century), the author (or an interpolator) states that he cannot endure those who believe in "Perun, Chors, Sim, Rigl, Mokosh, and the Vily, sisters thirty in number . . . and they pray to fire, calling it Svarozhich," and mentions that a marriage is improper "where they pray to fire . . . to the Vily, to Mokosh, Sim, Rigl, Perun, Volos, god of cattle, and Khors, to Rod, the Rozhanitsi, and all their cursed gods."[89a] Reference should be made also to the *Tale of*

Igor's Expedition, a short prose epic of unique literary value dating from the close of the twelfth century, which speaks of the winds as "the grandsons of Stribog," and mentions the deities Khors and Dazhbog, though only as mythological adornment of the narrative, and with a euhemerism characteristic of the period.[90]

Finally, a striking instance of rendering Greek names of divinities by corresponding Slavic appellations is contained in the Slavic translation of the second book of the Greek chronicler Malalas (sixth century) which was done into Slavic in Bulgaria during the tenth or eleventh.[91] The passage deals with legendary events of Egyptian history: "After the death of Fiost, *who is also called Svarog*, the Egyptians were ruled over by his son, called the Sun [in the Greek original Ἥλιος], *who is also known as Dazhbog* . . . Sun the king, the son of Svarog [in the Greek original Ἥφαιστος], *also known as Dazhbog*, was a strong man." Thus Helios and Hephaistos are translated respectively by the Slavic equivalents Dazhbog and Svarog: furthermore, the explanatory clauses here given in italics have no correspondence in the Greek original and are thus the interpolations of a Russian glossator who recalled that Svarog had been the pagan Slavic god of fire, and connected the latter with Dazhbog, the sun.[92]

The passages quoted both from the *Primary Chronicle* and from the religious texts indicate, however, that even though there were men alive in the lifetime of the compiler of the Chronicle "who remembered the conversion of Rus,"[93] all detailed recollection of the earlier mythology and of the attributes of the Eastern Slavic pagan gods (such as they were) was wiped out during the century which followed conversion. Furthermore, while the Eastern Slavs never possessed anything remotely resembling an organized pantheon, the

---

i v Vily, ichze čislom 30 sestrenicj . . . i ognevi moljatj že sja, zovušče ego Svarožicjmj"; p. 377: "iže moljatsja ognevi . . . , vilam, Mokoši, Simu, R'glu, Perunu, Volosu skotju bogu, Chursu, rodu, rozanicjam, i vsem prokljatym bogom ich." The possibility is of course present that these texts, as well in that of the previous note, have been influenced by the Primary Chronicle. Anichkov's reconstruction of these texts is highly subjective.

references of devotional texts to Rod, the Rozhanitsy, and the Vily point to the existence of a body of early folklore of which surviving traces might be expected to supply some data on the primitive cult, even though the myths behind it vanished upon the elimination of the pagan priesthood by whom it was practised.[94]

Though Perun appears prominently in most of the texts cited, there is no evidence that he was a general Slavic deity at all.[95] The name is a *nomen agentis* with suffix *-un* from the root *per-* 'to strike,' and therefore means 'the striker' as applied to the thunder. Outside Russia, the word appears only in Polish *piorun*, 'thunderbolt.' Since he is the deity by whom the pagan Varangians habitually swore, the conclusion is justified that Perun is simply the early Russian name for the Scandinavian Thor. Eastern Slavic folklore contains no traces whatever of a thunder-cult; the thunder is considered as the rolling of Elijah's chariot frightening devils, while the lightning is the prophet's darting arrow.[96]

Though the alien origin of Perun is thus clear, the source and functions of Khors are less readily definable. The name of the latter has been at one time or another explained as Greek, Iranian, Turkish, and Slavic, and the deity himself characterized as a sun-god or even as the spirit governing the moon. The derivation from Gk. χρυσός, with the explanation that the name was applied to some golden statue, is not only feeble but impossible linguistically.[97] The notion that this god was taken over from some Turkic nomad tribe is equally indefensible, since the only Turkish tribe which seriously affected the Eastern Slavs was the Khazars, but little is known of their religion prior to the adoption of Judaism by their ruling class, beyond the fact that, like the Huns, they worshipped one great spirit to whom

[94] Cf. A. Brückner, "Mythologische Thesen," *Archiv f. slav. Philol.*, XL (1925), 3. As we are here concerned purely with Eastern Slavic paganism, I share the extremely sceptical attitude adopted by this authority with regard to the entire problem.

[95] The Polish place-names Piorunka, Piorunuv, etc., more probably designate a place where the lightning had struck. The translation of Zeus by Perun in the Bulgarian *Alexandria* (cf. Niederle, *Živ. Star. Slov.*, II, i, 99) results from a purely literary convention (similar to Dazhbog-Helios and Svarog-Hephaistos) rather than from any recollection of a cult. The Polabic *peren-dan* (*ibid.*, p. 98) is simply a literal translation of *Donners-tag*, with no religious significance whatever. Even Niederle is sceptical of the general Slavic character of Perun: "On ne peut, à vrai dire, démontrer rigoureusement qu'il ait existé chez tous les Slaves" (*Manuel*, II, 138). While he bases on Procopius his assumption that Perun is a general Slavic deity, the Greek historian is not a reliable source in the light of the complete absence of any Slavic folklore data on a Slavic thunder-god.

[96] D. Zelenin, *Russische Volkskunde* (Berlin, 1927), p. 398.

[97] Cf. Niederle, *Živ. Star. Slov.*, II, i, 120–122, and for Brückner's suggestion of the moon, *Mitologja Słowiańska* (Cracow, 1918), pp. 97–98.

they sacrificed annually.[97a] On the other hand, the appellation 'Jewish' applied to Khors in certain later Russian saints' lives and apocrypha would in itself constitute precisely as valid a reason to class Khors as a deity borrowed from the Khazars as to consider him the spirit of the moon, on the basis of the passage in the *Tale of Igor* where it is reported that the magically endowed prince Vseslav of Polotzk galloped by night from Kiev to the strait of Kerch "across the road of the great Khors."[98] On the whole, an Iranian origin seems most probable, in view of the M. Pers. *khurshid*, 'sun,' and more remote Iran dialect forms like *khir*, *khör*, *khür*. Indeed, we have less convincing data on this deity than with respect to Simargl, of whom it is not even certain whether the name should be thus written or divided into two parts and viewed as designating two gods. However, a good etymological case can be made for the names *Sim* and *Rigl* as separate deities. *Sim* (cf. Lett. *sàime*, Lith. *šeimýna* 'family') may be the god of the family or the house-spirit, while Rogl (cf. Lith. *rugỹs*, "rye") would be god of the harvest, an etymology especially tempting, both in the light of surviving traditions of a related Baltic deity and because of numerous kindred Polish placenames.[99] In the case of Mokosh, folkloristic survivals indicate that she was not a divinity at all, but a female house-spirit associated with women's work, especially shearing the flocks and spinning wool or flax; she is, at any rate, the only member of Vladimir's canon traceable in modern superstition.[100] Stribog, frequently interpreted as "the god of the whistling winds," from the appellation "grandsons of Stribog" given to the winds in the *Tale of Igor*,[101] has likewise been referred to the stem *strib-* "to jump" and explained as a leaping demon of the spring or of vegetation.[102] These deities possess historical importance only because of their frequent mention in the sources. Their attributes (so far as known or conjectured) cast little light on the nature of Eastern Slavic paganism. Indeed, their very occurrence in the *Primary Chronicle* and elsewhere derives only from some monastic scribe's vague memories of a pagan past, amplified by his observations of current superstitions among the unlettered.

[97a] Marquart, *op. cit.*, p. 15.

[98] *Slovo o polku Igoreve, ed. cit.*, p. 72.

[99] Brückner, *op. cit.*, pp. 93–97. It should be noted, however, that G. Vernadsky, *Ancient Russia* (New Haven, 1943), p. 328, derives Simargl from "the mythical bird-dog Senmurv" of the Scythian and Sassanian periods.

[100] Mikkola, *op. cit.*, p. 395; Niederle, *op. cit.*, pp. 122–124. B. D. Grekov. *Kievskaja Rusj*, 4th ed. (Moscow, 1944) defines Khors as an oriental sun-god and Mokosh as "a goddess of the Finnish tribes."

[101] *Slovo o polku Igoreve, ed. cit.*, p. 79.

[102] Niederle, *op. cit.*, p. 119; Brückner, *op. cit.*, pp. 99–100, though the latter explanation is hardly more than tentative.

Of all the deities mentioned in the early sources, the first of major importance both for the Eastern Slavs and for the whole Slavic ethnic group is Veles (Volos). The *Primary Chronicle* (cf. p. 76 above) characterizes Veles as "the god of cattle" (*skotji bog*), but he is not mentioned by the Chronicle among the deities to whom Vladimir erected idols in 980. However, a *Life* of Vladimir mentions specifically that Vladimir caused an idol of Veles to be cast into the Pochaina creek below the citadel of Kiev, and there is also a late tradition concerning an idol of Veles in Rostov.[103] The general Slavic occurrence of Veles is likewise attested by his frequent invocation as a pagan demon in curses preserved by Bohemian texts of the fifteenth and sixteenth centuries.[104] The qualification "god of cattle" has no relation to the original attributes of Veles, but results from the monkish chronicler's identification of the specifically Russian form of his name (Volos) with that of S. Blasius (O. Slav., *Vlas*, Russ. *Volos*), a Cappadocian bishop who died a martyr's death *ca.* 316 A.D., and was extensively revered thereafter as the patron of flocks and herds.[105] This identification of Veles with the saint had misled almost all previous investigators to characterize Veles as an agricultural divinity, though the etymology of the name forbids any such attribute. Where Perun and Veles are mentioned together as the gods by whom Oleg's Varangian and Slavic followers swore, the implication is that the Varangians swore by Perun and the Slavs by Veles. The latter may thus be viewed as the guardian of oaths. The name itself is cognate with the Lithuanian *velȳs* "corpse," *vēle* "ghost," *vēlnias* "devil," so that Veles is to be interpreted as the god of the dead, a conclusion also supported by the identification of Veles with the devil in the mediaeval curses just mentioned.

As Veles is the Slavic god of the underworld, so Dazhbog (also mentioned among Vladimir's idols) is the sun, the giver of wealth and plenty. The identification of Dazhbog as the sun is indicated only by the Malalas glosses (see p. 78 above), but the etymology of the name (*da-* "give," and *bog-* "wealth, plenty"; the second root appears also in Russ. *bog-aty* "wealthy," and *u-bog-y* "poor") serves further to support this interpretation. Along with the sun as the giver of wealth, the Eastern Slavs also worshipped fire, deified as Svarog, or Svarozhich. While the Malalas glosses would make the latter form appear as a patronymic, so that Dazhbog has frequently been characterized as "the son of Svarog," this interpretation is erroneous

since the Slavs never entertained any notion of the kinship of their various deities. Svarozhich is thus not a patronymic, but a diminutive, like the Lithuanian *dievâitis* (from *diẽvas*, "god"). The name Svarog itself is related to *svar*, *svara* "quarrel," and signifies "the smith," "he who contends with the fire," hence the smith who forged the sun and controls it in the sky, but manifests himself on earth as fire.[106] The evidence of the Arabic sources that the Slavs were all fire-worshipers and the survivals of a fire cult in both Ukrainian and White-Russian folklore provide a solid motive for believing that a sun and fire myth lay at the root of Slavic cosmogony.[107]

Procopius denied the Slavs any belief in fate (*heimarmenē*), yet there is abundant proof that an agency of this nature, though related rather to both fortune and fertility than to destiny, played a considerable role in the religious lore of the Eastern Slavs and of the Slavs in general. Passages have already been cited to the effect that the pagan Russians praved and made offerings to these divinities.[108] It is scarcely to be supposed that the latter have any connection with the classical fates (*Moirai* and *Parcae*), and their function also precludes any notion that they were the souls of ancestors preserving or influencing the destiny of their descendants. Indeed, they possess no manistic character whatever. Throughout the Slavic languages, the primary meaning of *rod* is the yield of fields and crops, then the increase of the family (hence ultimately "birth"), culminating in the eventual use of *rod* in Old Russian as a social *terminus technicus* (see above, pp. 51–52). Evidence of the Slavic veneration of Rod personified as the power which inspires the breath of life in man is supplied by a fifteenth-century Russian polemic which declares: "The immortal and never-aging breath of life is inspired only by the Almighty, . . . for he blew the breath of life into man's face and so man received a living soul; hence it is not Rod, sitting in the air,

[106] Brückner, *op. cit.*, pp. 54–55, 69–71, *Archiv.*, XL, 11. For summary of other hypotheses, cf. Niederle, *op. cit.*, pp. 105–111 and nn. I have accepted Brückner's theory as the only one satisfactory from the standpoints of linguistics and folklore. There is no evidence whatever that this basic myth is of foreign origin, and in the history of studies in Slavic mythology there has been an unfortunate tendency to take refuge in the supposed foreign origin of a given deity whenever its attributes or etymology are problematic. Mansikka's suggestion "Höchstens könnte man von einer schon längst vergessenen, *ursprünglich nicht slavischen*, Volksage reden, in welcher vom Ursprung des Feuers und der Sonne erzählt wurde" (*op. cit.*, p. 397), may thus be rejected.

[107] Cf. Ibn-Rusteh, in Khvolson, *op. cit.*, pp. 30–31; other references in Niederle, *op. cit.*, p. 84, n. 5. It may also be noted that the pagan Slavic prayer before sowing quoted in the same passage lends further support to the interpretation of Dazhbog as the life-giving sun which provides wealth and plenty.

[108] Mansikka, *op. cit.*, pp. 246, 247, 250; other references to Rod, *ibid.*, pp. 305–306.

which casts heaps upon the earth, from which children are born. . . . God, not Rod, is the creator of all things."[109] Rod is accordingly the god of fertility and good fortune in the life he creates. The Rozhanitsi in turn are the female spirits who aid women in childbirth and assure good fortune to the newborn child, and thus must be invoked as soon as the babe is born.[110] In mediaeval Russia the superstitious even maintained the custom of setting up at Christmas a so-called "second table" for Rod and the Rozhanitsi.[111] The prevalence of the cult of the Rozhanitsi (with varying terminology) among all other Slavs except the Poles demonstrates the general Slavic character of these beliefs.[112]

The religion of the pagan Slavs was thus primarily animistic in its origins, and the animistic personification of powers of nature is further exemplified by abundant references to water and forest spirits (*vily*, *beregynji*, *lesie*).[113] Numerous traces of manistic conceptions are visible in the widespread belief in a house-spirit (*domovoĭ*),[113a] but the association of nature spirits with the impure dead in modern folklore points rather to Christian contamination than to any manistic origin of the latter class of minor divinities. In any case, the belief of the pagan Eastern Slavs in a future life of some sort is indicated by the funeral ceremonies (cremation) attributed to the tribesmen of the ninth century by the *Primary Chronicle*.[114] Among the Russian tribes, the practice of placing the ashes in an urn which was set on a post by the roadside rose from superstitious fear of the spirit of the departed, which was supposed (as in modern folklore) to have some attachment to its earthly residence; a similar motive lies behind the modern Great Russian peasant custom of carrying to the edge of the village all objects and utensils connected with the death and laying-out of the deceased.[115] Pagan Slavic eschatology was confined, however, to the persuasion that the spirits of the dead led a life similar to that which they had experienced on earth, so that all notions of hell and paradise are of purely Christian origin. With the introduction of Christianity, the cult of the major deities faded out,

[109] Mansikka, *op. cit.*, p. 306: "vdunovenie bezsmertnoe nestarějuščee edin vdymaet vsedŭržitelj . . . dunu bo emu na lice duch žizni . . . to ti ne *rod*, sedja na vosduše, mečetj na zemlju grudy i v tom ražajutsja děti . . . vsem bo estj tvorec Bog, a ne *rod*."

but traces of paganism long endured among the masses in their superstitious beliefs in minor household and nature spirits and in the old gods of luck and fortune.

Although there is no explicit evidence for a caste of priests among the Eastern Slavs in pagan times, the prevalence of magicians and sorcerers (after the conversion) who claimed to be in touch with a non-Christian spirit world would place their origins among the debased interpreters of the old cult. Early Russian sources, especially Hilarion's *Discourse on Law and Grace*, refer to pagan shrines or altars known as *kapishcha*,[116] at which sacrifices were offered, and one such altar was found in Kiev itself, surrounded by the bones of animals sacrificed upon it.[117] These shrines were visualized by Hilarion as a small inclosed structure with an altar. Apart from Vladimir's idols and the doubtful idol of Veles at Rostov (see above, pp. 76, 81), it is not clear that the Eastern Slavs possessed any idols at all; on the other hand, their existence among the Western Slavs is well attested. The pagan cult of the Western Slavs possessed, however, the dignity of an official religion, and thus developed a complexity of observance which Eastern Slavic paganism, modified by the official Thor-Perun cult of the Varangians, never attained before its suppression at the end of the tenth century.

A final and equally interesting problem connected with the primitive culture of the Eastern Slavs is a determination of the epoch at which they learned to write. While there have been some fruitless though entertaining attempts both at the forgery of specifically Slavic runes and at the identification as genuinely Slavic of certain runic texts more probably of North-German origin, it is, on the whole, unlikely that letters of any sort were known in the pre-Christian period apart from cases where a more or less educated Slav managed to write down a few phrases of his language in Greek or Latin characters.[118] A Bulgarian source of the late ninth century, the so-called *Apology of the Monk Khrabr*, which discusses in some detail the origin of the Slavic alphabet and asserts it is more sacred than the Greek because it was invented by St. Cyril, thus declares that "originally the Slavs had no letters, but counted and calculated by

lines and notches; and after they were converted, they were obliged to write the Slavic language with Roman and Greek letters without system," remarking at the same time that it was impossible by this means to reproduce the pronunciation of peculiarly Slavic vowels and consonants, of which the author offers several examples.[119] Khrabr's reference to counting and calculating by lines and notches has a modern parallel in the sticks of wood known as *rabushi* on which, by means of incised symbols, the illiterate Yugoslav peasants kept their accounts, a practice sufficiently recognized and widespread to have caused their admission as legal judicial evidence under the Serbian civil code of 1887. The *rabushi* were even used by Serbian tax collectors in the nineteenth century, and cases are recorded where a rural official might have in stock as many as 450 of these sticks incised with numerical symbols, and still be able to recall without difficulty to what individual each such stick applied.[120] These are, however, mnemonic or arithmetical devices unconnected with the actual practice of writing, and thus offer no evidence of learning. There can be no question but that the Swedish colonists or mercenaries in tenth-century Russia themselves knew the so-called younger runes: the earliest Swedish rune-stone referring to a death in Eastern Europe was found in Västra Stenby (Östergotland) and belongs to the first half of the tenth century. Five other rune-stones of this or the following century are extant which bear specific references to Swedes who died in Russia. Yet only one rune-stone has so far been found in Russia itself. Discovered on the island of Berezan, at the mouth of the Dnieper, this stone belongs to the first half of the eleventh century and its inscription states that it was erected by one Grani to his comrade Karl.[121] There is no evidence, however, that the Russian Slavs themselves made use of the runes which were familiar to their Varangian contemporaries. With the use of runes by the early Swedish immigrants in Russia is connected, at least indirectly, a problem raised by the item in the Pannonian *Life* of St. Cyril (Constantine), which reports that when Cyril was in Cherson on his mission to the Khazars he found there a gospel and a psalter written in what are called *rosĭsk* (which would normally mean "Russian") characters.[122]

The only *Ros* known to the Greeks *ca.* 860 were the Scandinavian freebooters who raided the coasts of the Pontus, and these books thus cannot possibly have been written in any Slavic language of the time. On the other hand, converted Varangians do not appear in Russia till nearly a century later, and (still more important) there is no evidence whatever that a translation into Norse or Old Russian was made of the Greco-Russian treaties of 911 and 945. As the texts themselves indicate, they were executed in duplicate, but in Greek, thus proving at least that Norse was not being used for documentary purposes at this period, while the exclusively Scandinavian character of the Russian negotiators suggests that an Old Bulgarian translation (theoretically possible at either date) would have been useless. A Slavic or a Scandinavian identification of the *rosĭsk* characters is thus excluded. The confusion probably rises from reading *rusĭsky* for *surĭsky*, and the characters must very likely have been Syriac.

From this accumulation of not only scattered but oftentimes both confusing and debatable detail, the main lines of Eastern Slavic culture at the close of the pagan period become discernible. Essentially an agricultural people, yet living also by hunting and trapping in newly colonized and sparsely settled areas, the Russian Slavs tended to develop beyond a purely patriarchal society as soon as they came to inhabit small farms grouped about a fortified village which served as their strong-point for defense and as a rudimentary market for the exchange of their products. Such of these villages as were strategically located on the chief water courses developed into genuine trading-posts and towns, the importance of which was enhanced by the penetration of foreign merchants at the beginning of the historical period. The rise of trading-posts and towns gradually concentrated adjacent agricultural areas under the control of the latter, producing at the same time accumulations of wealth in the hands of a new ruling class which appropriated to itself the influence formerly wielded by the elders of family, clan, and tribe. The growing prestige of the towns also broke down the previous tribal differentiations, since portions of the same tribal area might fall for reasons of geography and communication under the control of different towns.

Filosofa," *Slavia*, III (Prague, 1924), 44 ff., also A. A. Vasiliev, *Goths in the Crimea* (Cambridge, 1936), p. 113 and no. 6. A. Vaillant, *Revue des Etudes Slaves*, XV (1935), 75–77, first suggested that *rusĭsky(mi)* is a scribal error of *surĭsky(mi)*, and would therefore view these texts as Syriac. The acceptance of this suggestion depends on establishing how much Hebrew Cyril knew and how easily he could accordingly assimilate Syriac. Roman Jakobson, however, "Saint Constantin et la langue Syriaque," *Annuaire de l'Institut de Philologie et d'histoire orientales* (New York, 1944), pp. 181–186, has clarified the argument considerably and, indeed, closed the case.

The mass of the population were free farmers or artisans, with only a small admixture of slaves until the latter became a profitable article of commerce. For their technique in agriculture, mechanical trades, and arms, the Slavs were largely indebted to their neighbors, and to the Germans in particular, since the spread of mediaeval techniques among the Slavs becomes most marked from the Carolingian period forward. In spite of an early knowledge of metals, the Slavs acquired little skill in metallurgy until the close of the pagan age. Well fed on a considerable variety of cereals, vegetables, fowl, domestic animals, and game, the Eastern Slavs inhabited small wooden houses, usually with two rooms and connected with sheds for storage and the shelter of their poultry and cattle. They were clad in coarse linen, hempen, or woolen fabrics, supplemented by furs as a protection against inclement weather. Jewelry and other adornments were articles of import exchanged for the furs, pelts, wax, honey, and slaves which were Slavic staple exports. The Eastern Slavs of the eighth century were already in sporadic contact with the Arabic Orient, Byzantium, and Central Europe, and their progress in civilization is exclusively due to this contact. Polygamous in practice, they have evolved from animistic origins a religion of polytheistic and anthropomorphic character, associated with manistic features connected with a rudimentary belief in a future life. Since their social structure was as yet by no means homogeneous, still showing traces of the most primitive patriarchal organization contemporaneous with the rise of concentrated settlements analogous to the western borough and town, they were ripe for the action of some unifying agency which would join these scattered units into a coherent economy. Though illiterate, their rapid adoption of foreign techniques stamps them as possessed of a receptive intelligence. The close of the pagan period thus found the Eastern Slavs ready for the essentially dynastic policy of the immigrant Varangian princes of Kiev and for the absorption of cultural influences rising from intensified relations with Byzantium. While the domination of the Khazars during the eighth and early ninth century had fused the Slavs along the lower Dnieper and its tributaries into a loose federation, it had not extended the Khazar influence to the northern tribal agglomerations. The penetration of the Vikings from the north during the ninth century strengthened the ties between the Slavs at either end of the central Russian trade-route. Once this trade-route was definitely linked with Byzantium, the way was cleared for the introduction of Byzantine culture among the Eastern Slavs, who continued to absorb it until the route was once more barred by the nomads of the steppes three centuries later.

Pytheas the Massaliot and the Baltic. Myth or Reality?

Søren Skriver Tillisch, MPhil
Primary school for gifted children (Atheneskolen), Denmark
soren4@hotmail.com

Abstract. Pytheas the Massaliot travelled the entire European coastline from Gades (Cadiz) to the mythological northern mouth of the Tanais (Don), circumnavigated Britain, reached ultima Thule, probably the Faroes, and the amber island of Abalus, probably Thy, and Norway, possibly the land of the Periscians. This article revisits the idea of Pytheas reaching the Baltic, very possibly the area of the northern mouth of Tanais (Vistula? Nemunas?), and the idea of Kaali on Saaremaa as "the place where the sun went to bed"'. The examination of the question is introduced with a historiographical excursus and chapters on the scientific background of the journey, the measurements of Pytheas, his hometown Massalia and his journey as far as the Western Baltic. The argument will be exposed through analysis and comparison of the archaeological and written evidence.
In conclusion it is argued that Kaali on Saaremaa was visited by Pytheas the Massaliot and may indeed be considered "the place where the sun went to bed" but not "ultima Thule".

Keywords: Pytheas the Massaliot, Ancient Greece, The Baltic, Sarema.

Pitėjas Masilietis ir Baltija. Mitas ar tikrovė?

Anotacija. Pitėjas Masilietis (gyveno IV a. pr. m. e.), senovės graikų geografas, apkeliavo Europos pakrantę nuo Kadiso (Cadiz) iki Tanais (prie Dono žiočių), apiplaukė Britaniją, pasiekė Ultima Tulę, tikriausiai Farerus, gintaro salą Abalus ir tikriausiai Norvegiją. Straipsnyje dar kartą apžvelgiama Pitėjo, pasiekusio Baltiją, šiaurinės Tanais žiočių (Vyslos? Nemuno?) kelionės ir Saremos Kaali, kaip „vietos, kur saulė nuėjo miegoti“, aplankymo klausimas. Problema nagrinėjama, pasitelkiant istoriografinį ekskursą, Pitėjo ir jo gimtojo miesto Masalijos matavimus, kelionę iki vakarų Baltijos, analizuojant ir lyginant archeologinius ir rašytinius įrodymus. Apibendrinant teigiama, kad Pitėjas Masilietis apsilankė Kaali Saremos saloje ir iš tiesų ši vieta, bet ne „ultima Thule“, gali būti laikoma „vieta, kur saulė nuėjo miegoti“.

Reikšminiai žodžiai: Pitėjas Masilietis, senovės Graikija, Baltija, Sarema.

Introduction

It is today beyond reasonable doubt that Pytheas the Massaliot, who claimed to have travelled the entire European coastline from

Gades (Cadiz) to the mythological northern mouth of the Tanais (Don), circumnavigated Britain, reached ultima Thule, probably the Faroes, and the amber island of Abalus, probably Thy, and Norway, possibly the land of the Periscians, those who live around the shadow, i.e. the northern polar circle.

The evidence for reaching the Baltic is much less conclusive.

One example, the identification of Kaali on Saaremaa as “the place where the sun went to bed” and shown to Pytheas by the Barbarians, and the island itself as “ultima Thule” (Meri, 1976), has been doubted due to serious concerns about the archaeological and historical probability (Mägi, 2004) and the fact that the two interrelated fragments mentioning it appear to allude to Odyssey I,22–25. The use of Homeric references should, however, be expected in almost any Greek source from the 4th century BC, and so does not preclude that the possible Homeric allusion does not have some basis in reality.

The following article will explore this possibility through careful analysis of the archaeological and written evidence applying a model for using written and archaeological sources together first developed more than a decade ago (Tillisch S. S., 2009). The basic tenet of this model is that archaeological and written sources may be used together if there is corroborative evidence.

A case in point would be “Caesar’s lilies” mentioned during the battle for Alesia in *Bel.Gal.* VII,73. “Carsea’s lilies” were sharpened wooden poles placed pointing upwards in holes or ditches covered with brush by the Roman legionaries. Corresponding examples in Denmark, notably around the fortified site Borremose, the early village of Grøntoft and the somewhat later Lystbækgård site has been plausibly explained through

Caesar (Jensen J., 2003, p. 94–98). This is an example where an apparetently unrelated historical source may provide a possible answer to archaeological finds elsewhere.

The model should be used sparingly, not least when working with a fragmentary work like Pytheas the Massaliot's. Any interpretation will be bereft with caveats and debatable conclusions, but this should not deter an attempt to revisit the evidence for Pytheas the Massaliot's presence in the Baltic. Thus I will in the following reexamine the archaeological and scientific evidence for this and compare the evidence to Geminos *Phainomena* 9,6 and Pliny Naturalis Historia 4,94–106 directly mentioning Pytheas and also the possible relation to *Argonautica* 4,590–656 and Ptolemaios Klaudios

The examination will be introduced with a historiographical excursus and short notes on the scientific background of the journey, the role of Massalia, the measurements of Pytheas and his journey as far as the Western Baltic.

Historiography

Many German works (Schmitt A., 1876; Kähler F., 1903) and Christopher Hawkes (Hawkes C. F. C., 1978) have argued that Pytheas reached the area around the Oder or the Vistula and East Prussia with its large amber reserves. Recently Bianchetti has suggested that parts of the description of the Baltic coast in Pliny *Naturalis Historia* 4.94–104 also derives ultimately from Pytheas the Massaliot and is integrated in the later Roman sources in Pliny's work (Biancheti S., 2020, p.15–16).

It was, however, only rather late and in an unscientific way that the journey was extended to the north, to Saaremaa and Kaali lake, claimed to be "the place where the sun went to bed" and Thule (Meri L., 1976). While not a

trained archaeologist or historian he still compared the archaeological findings around the crater to nearby sites like Asva and Ridala, in trying to back up his claim. This claim played a small part in Estonian nation building in the 1970s and 1980s as Estonian ‘westernness’ was postulated, a development tacitly encouraged by Western powers (Sommer L., 2019), and this is possibly the reason that a theory supported by very little evidence and written by a nonarchaeologist has been accepted as at least a reasonable hypothesis, though it has also received heavy criticism by archaeologists (Mägi M., 2004) as well as historians, notably Herbert Ligi. It should also be noted that the idea of Thule as Estonia plays a part not only in Lennart Meri’s westernized postcolonial thoughts but also in his ideological counterweight Jaan Kaplinski’s *Vercingetorix ütles* (‘Vercingetorix said’, 1965) in which Ultima Thule features alongside Styx, the river around Hades, in Kaplinski’s argument that much of ‘Estonianness’ really is a construct of the 19th Century and heavily influenced by German ideological ideas, whereas Kaplinski hails the Eastern elements of Estonian culture (Sommer L., 2019, p. 3–5). Interestingly, this quote, translated into English, from *Vercingetorix ütles* makes quite clear the root of Meri’s ideas:

So be it imperator: let there be in your republic
one language, one faith and one people.
Let the road be secure and smooth/
for your soldiers, merchants and crooks/
as far as Ultima Thule
and up to the River Styx

Since Meri suggested that “Ultima Thule” was Saaremaa and that the Kaali meteorite crater was “the place where the sun went to bed” all scientific articles concerning the crater have in some way been forced to relate to the idea. Most of these studies have been written by nonspecialists in Classics and tend to give the

idea the benefit of the doubt, though actual archaeologists remain much more sceptical (Mägi M., 2004, p. 83). A relatively recent work has attempted to prove Meri being right (Talvik R., 2015) but is written by a nonspecialist, a medical scientist, rather than a historian or an archaeologist, and has not resolved the matter.

The scientifc background of Pytheas' journey

Pytheas the Massaliot's journey took place in the late 4th century BC. At that point in time the Greeks operated within an understanding of the *oikoumene* and the *kosmos* developed by the Ionian natural philosophers in the 6th–5th century BC, and this understanding is described in Herodotos of Halicarnassus' *Historia* (around 430 BC).

This world, fundamentally a flat disc surrounded by the Ocean was, from the age of Anaximander in the later 6th century BC suspended in a cylindrical *kosmos*, from the later half of the 5th century BC it became a circular Earth in a circular kosmos. The people of Greece, Egypt and Mesopotamia lived in the *oikoumene* while the Scythians were thought to live to the north, the Persians to the east, the Aithiopians to the south and the Celts to the west (fig.1) in the dangerous periphery. The Greek poleis to the west, of which Massalia was one, were small societies on the limits of the *oikoumene*, and therefore potentially strange and dangerous places to those living in Hellas proper (Fabre P., 1981, p. 1–7).

Fig. 1. World map of Ephorus (4th Century BC). Based on Kosmas Indikopleustes (6th Century AD). From Wolska-Konus W. 1968, 397.

1 pav. *Eforo pasaulio žemėlapis (IV a. pr. Kr.). Remiantis Kosmas Indikopleustes (VI a. po Kr.). Iš Wolska-Konus W. 1968, 397*

The two great rivers of the Nile in Africa and the Istros (Danube) in Europe where both thought to have a twin mouth corresponding to the ones in the Mediterranean and the Black Sea – in the Atlantic Ocean (probably the Senegal) and the Mediterranean (the Rhône) respectively. This curious idea stemmed from the idea of a symmetrical *kosmos.* The idea of the second mouth was also assumed for the Tanais, as it emptied into the Maeotis (Azov Sea). Thus the claim by Pytheas that he reached the northern mouth of the Tanais lead us to search for river mouths along Europe's northern seaboard, of which more below.

The basic design of this *kosmos* was not fundamentally altered during Antiquity. It had to be adjusted to the circular Earth in the 5th century BC, and the Persian and Alexandrian Wars opened the world to the east up, as the Massaliot and Carthaginian explorers did in the west, but mostly these new discoveries were suppressed in literature and often presented as adjustments to the already existing knowledge (Bianchetii, 2008, 2020; Clarke K., 1999, p. 308–312; Fabre P., 1981, p. 20–22).

It would seem that the concept of the Earth as round came to be in the late 5th century BC. "The Clouds" clearly allude to a circular Earth suspended in "aether" by Aristophanes of about 423 BC. Meton, who is lampooned in "The Birds" (998 ff.) is a likely early proponent for the idea, since he also developed the Metonic cycle based on the 19 year cycle of the Moon, later a central component of the

Antikythera mechanism (Jones A., 2017, pp. 47–52).

It is important to understand that only with further observations concerning the movement of the Sun, the Moon and the planets it was possible to scientifically determine the sphericity of the Earth in the first half of the 4th century BC through Eudoxus of Cnidus, who also realised the importance of the tropics and the northern polar circle (Mittenhuber F., 2003, p. 44–45).

Instruments and measurements in Pytheas

The following will focus on instruments, stadia and solar heights and their assumed and apparent real precision. Up until the age of Pytheas we have no actual measurements of geographical distances, and his measurements of parallels are thus probably the oldest available (Heidel W. A., 1937, p. 8–11, 56–59). We find a number of measurements in the corpus of Pytheas the Massaliot – stadia, solar heights, sailing days and sailing days-and-nights. Therefore it is necessary to ascertain, if possible, which measurements Pytheas used.

Often it has been stated that the measurements were executed with a simple gnomon and a measurement pole with scaled and movable plates and the basic measurements of a foot, a cubit and a stade (Lewis M., 2001, p. 40–46). Recent research, notably on the aforementioned mock description of one of Meton's instruments, and in the description of Eratosthenes' instruments, notably the 'skiotherikos gnomon' have, however, cast doubts on the simplicity and scarcity of types of the instruments involved (Leigemann D. et al., 2005, p. 238–39). Further, the imprecision amounting to 3–400 stades or 34 arc seconds, assumed by many, including

Eratosthenes (Heidel W. A., 1937, p. 125), have been questioned while using a device reconstructed based on ancient descriptions of Meton's instruments, called a 'diabetes' (fig. 2, Leigemann D. et al., 2005, pp. 240). This instrument is basically a 'shadow catcher' placed on top of a turntable with 360 degrees and the 24 Greek 'winds' marked on the turntable, and the measured precision is down to 50 stades (8 km) or 5 arc seconds, i.e. close to that of a sextant. As we shall see the precision indicated by the preserved measurements of Pytheas the Massaliot would seem to be greater than 34 arc seconds and closer to 5 arc seconds, thus indicating the use of such a 'shadow catcher'.

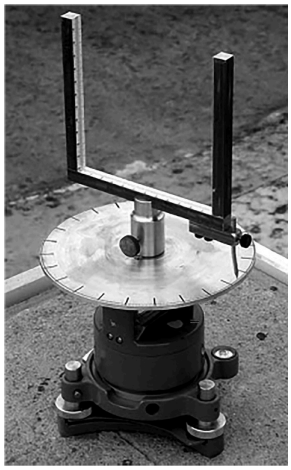

Fig. 2. Reconstructed "shadow catcher" based on descriptions in ancient sources. Possibly called a 'diabetes'. Leigemann et al. 2005, Abb. 4, p. 243.

2 pav. *Remiantis senovės šaltinių aprašymais rekonstruotas „šešėlių gaudytojas". Galbūt vadinamas „diabetu". Leigemann et al. 2005, Abb. 4, p. 243*

As for the specific measurements there were some constants. Thus a cubit was divided into 24 daktyls ('fingers'), and 12 daktyls corresponded to one foot. Further 600 feet corresponded to one stadion (*Historia* 2.149), and one degree in the sky corresponded to one foot or half a cubit. However, the exact length

of the daktyl, foot, cubit and stadion varied widely across the ancient world (Gulbekian E., 1987, p. 357; Lehmann-Haupt K., 1929, col. 1931–1933).

The archaeologically preserved athletic stadiums from Archaic, Classical and Hellenistic Greece fall into three general groups where the stade must be considered to be circa 165, 180 or 191 metres. Thus the stadiums in Korinth, Delphi and Halieis were 165, 167 and 166.5 metres (median 166.17 metres). The stadiums in Delphi, Nemea, Athens, Epidauros and Isthmia were 177.15, 177.6, 184.3, 181.3 and 181.2 metres, respectively (median 180.32 metres). This is also the length a modern athletics stadium is modelled after, at 177.82 metres. Finally, the stadiums in Olympia, Milet and Priene were 191.28, 192.3 and 191.3 m, respectively (median 191.63 metres). The medians correspond to feet of circa 27.5, 29.6 or 32 cm, in Antiquity known as the Oscan-Italic, Attic (later Roman) and Doric foot (Romano D., 1993, p. 17–22; Gulbekian E., 1987, p. 357, 362–363).

Relating to the subject of this article archaeological excavations point to the preferred foot in Massalia was about 30 centimetres (i.e. the Attic foot) in 6th–4th century BC, and 27.5 cm (i.e. the Oscan-Italic foot) in 4th–3rd century BC (Tréziny H., 1989, p. 11–14, 18–20, 46).

Let us now proceed to what the sources tell us about Pytheas' measurements.

Our main source here is Strabo:

Geographika 2.1.12, 18:

"2.1.12. Since Byzantion (Istanbul) and Massalia are almost under the same parallel of latitude, as Hipparchus tells us they are, on the authority of Pytheas, and since Byzantion and

the Borysthenes have also the same meridian, as Hipparchus equally assures us, if we take his assertion that there is a distance of 3700 stadia between Byzantion and the Borysthenes, there will of course be a like difference between the latitude of Massalia and the Borysthenes. This would make the latitude of the Borysthenes identical with that of Keltike next the Ocean; for on proceeding 3700 stadia, we reach the ocean.
2.1.18……Hipparchus narrates that at the Borysthenes and the north of Keltike, during the whole of the summer nights there is one continued twilight from sun-set to sun-rise, but at the winter solstice the sun never rises more than nine cubits above the horizon. He adds that this phenomenon is yet more remarkable in regions 6300 stadia north of Massalia, (these regions he supposes to be peopled by Kelts, but I believe are inhabited by Britons, and 2500 stadia north of Keltike) where the sun at the winter solstice rises only six cubits above the horizon. That at 9100 stadia north of Massalia it only rises four cubits, and not so much as three in the countries beyond, and which I consider much farther north than Ierne (Ireland). However, Hipparchus, on the authority of Pytheas, places them south of Britain, and says that the longest day there consists only of 19 hours; while in countries where the sun rises but four cubits above the horizon, and which are situated 9100 stadia north of Marseilles, the day has 18 hours. Consequently the most southerly parts of Britain must be north of these regions."
(English translation slightly adapted from *The Geography of Strabo.* Literally translated, with notes, in three volumes. London. George Bell & Sons. 1903. At:
http://www.perseus.tufts.edu/hopper/text?doc=Perseus%3Atext%3A1999.01.0239%3Abook%3D2%3Achapter%3D1%3Asection%3D18)

We are here told that Massalia and Byzantion is almost on the same latitude, off by about two

degrees (43’17 N vs. 41 N) and we are provided a notation of the distances between parallels north of Massalia of 3,700, 6,300 and 9,100 stadia where the sun rises nine, six and four cubits at winter solstice, i.e. 12, 8 and 6 degrees if 0.5 cubit is one degree. It should thus be possible to pinpoint the latitudes and thereby the stadion used, since the inclination of the Earth relative to the ecliptic today is almost the same as in the 4th century BC (23’43’28 relative to 23’43’40 degrees).

The crucial information given is the one where we are told that at 9,100 stadia north of Massalia the midsummer day is 18 hours long. This corresponds to 58’13 north and to a winter solstice rise of 8 degrees or 4 cubits. The distance in kilometres between 43’17 and 58’13 north (14’56 degrees) is 1659.39 km, i.e. 14 degrees of 111.12 km, 56 arc minutes of 1.852 km. This would correspond to a stadion of about 182.35 metres and a foot of 30.4 centimetres. Very close to the foot known archaeologically in Massalia in the 6th–4th century BC and the Attic foot. Incidentally, 58’13 is tangential to Cape Wrath, Scotland’s northernmost point and very likely the Orkas of Pytheas the Massaliot. This parallel is also “right below the head of the Dragon (constellation)” as the expression goes in Krates of Mallos and Aratus, possibly reflecting a Pythean tradition, and coinciding with the Arctic circle as seen from Rhodes (Bilic T., 2012, p. 304).

Accepting 182.35 m as the stadion used here, 3,700 stadia north of Massalia corresponds to 48 degrees North, a parallel following the north coast of Britanny which is Pytheas’ most probable route, and besides there are several sites with evidence of cross-channel contact on the north coast of Britanny from this period. Most importantly the apparent emporium at Le Yaudet and the necropolis at Urville-Naqueville

(Cunliffe B. & Galliou P., 2004; Fischer C. et al., 2018).

Still using 182.35 m as the stade, 6,500 stades north of Massalia corresponds to 54 degrees north. In the British Isles this parallel runs along the northern Irish coast, through Morecambe Bay with its heavy tide, possibly the site of Pytheas' "sea lung" on the west coast and the prominent Flamborough Head on the east coast and across the North Sea to the mouth of the Elbe and along the northern Baltic coast.

Finally the three cubits or six degrees at winter solstice mentioned by Strabo corresponds to the situation on the Shetlands (61 N) where the midsummer day is 19 equinoctal hours, among the parallels mentioned by Geminos in *Phainomena* (see below).

To conclude the measurements of Pytheas, accepting a stadion of 182.35 m shows a remarkable precision consistent with the use of an instrument like the reconstructed "shadow catcher". Given this it is very probable that Pytheas used a stadion of 182.35 metres, but notes concerning Thule complicates matters a bit.

Strabo tells us in Geographika 2.5.8:

"It is true that Pytheas the Massaliot affirms that the farthest country north of the Brittanides is Thule; for which place he says the summer tropic and the arctic circle is all one. But he records no other particulars concerning it; whether Thule is an island, or whether it continues habitable up to the point where the summer tropic becomes one with the arctic circle."

And according to Eratosthenes in Strabo, Geographika 1.4.2:

"…Again; from thence [the Hellespont] to the Borysthenes, 5000; and thence to the parallel of Thule, which Pytheas says is six days' sail

north from Britain, and near the Frozen Sea, other 11,500 [stadia]."

And finally according to Ptolemaios Klaudios in Description of the Geography 8.2:

"Thus it is that at Thule the longest day is 20 equinoctal hours."

This latter claim is corroborated by Stephanos of Byzantion in the *Suda*.

These facts are somewhat contradictory. The central point is Ptolemaios. If Thule is where the longest day at midsummer is 20 hours this would mean a parallel of about 62 degrees North, a parallel passing through the Faroes and south central Norway near Ålesund. This corresponds quite well to six days sailing north of Britain, since this is likely what it would take a Greek ship travelling about 2 knots to reach the Faroes from Cape Wrath. Experimental sailing with a replica of the Kyrenia wreck, Kyrenia II, put the average speed at 2–3 knots, less in weather where the ship had to cross to the wind (Katzev, 1987, p. 250). This is also comparable to experimental sailing with replicas of Viking Age ships (Englert A., 2012, pp. 275–278). Some researchers believe that Ptolemy's latitude of Thule is a matter of speculation to accommodate his geographical-mathematical theories, and not based on actual observations (Shcheglov D., 2007, p. 5–7). However, the correspondence between experimental archaeology, the six days and nights and the 20 equinoctal hours of the longest day strongly suggest that Ptolemaios' Thule is real enough, and probably can be identified with the Faroes.

This conclusion is at first sight at odds with the measurement in stades. Thus we are told that Thule's position is six days north of Britain where the summer tropic is the same as the Arctic Circle (i.e. the actual Arctic circle). If the 11,500 stades north of Borysthenes mentioned

are 182.35 m this would mean that Thule would be in 65’07 degrees North, a parallel crossing northern Iceland and entering Norway in Nord-Trøndelag not too far from the actual Arctic circle. Thus this would indicate that Thule is Iceland or Norway, but also that Eratosthenes, Strabo’s source in this case, and Pytheas used the same length of the stadion.

However, 11,500 stades north of Massalia using 182.35 metres corresponds to 62 N, i.e. the place where the Arctic circle would be as seen from Massalia and also the parallel of 20 equinoctal hours where Thule is supposed to be according to Ptolemaios Klaudios and the *Suda*. Thus a mistake in mixing different measurements, done by either Eratosthenes or some later scribe, is all it would have taken to create the confusion, i.e. mistaking the 11,500 stades north of Massalia for 11,500 stades north of Borysthenes. Given the great precision shown above in all the other measurements by Pytheas the Massaliot it seems unlikely that he should have missed so massively on the parallel of Thule, and a later error by Eratosthenes, Strabo or someone else mistaking Borysthenes for Massalia most likely created the confusion.

A final example concerning the stadion Pytheas used. In Strabo Britain’s circumference is stated to be 40,000 stades. In Diodorus Siculus it is stated to be 42,500 while Pliny in his Naturalis Historia has it at 4,875 Roman miles. Using 182.35 m as the stade the former two translates as 7,294 km and 7,749.5 km, while 4,875 Roman miles correspond to 7,220 km. Based on this it would seem that Pliny recalculated a measurement akin to the one mentioned by Strabo. This circumference has been claimed to be way too high by Strabo and many modern researchers. However, through dynamic coastal theory this point is moot. A coast line is measured in steps, and it is important how many ‘steps’ any given

coastline is divided in. Unfortunately it is rare that the number of ‘steps’ and conditions for any given coastline measurement is relayed. And different ‘steps’ entails different lengths (Mandelbrot B., 1967; Lynch P., 2013; Rae A., 2016). Surprisingly, few researchers have actually tested Strabo’s claim. Even researchers who ought to know better postulates that Caesar’s 2,000 Roman miles are more precise than Pytheas (e.g., Horst Roseman C., 1994, p. 126; Steensby H. P., 1918, p.16). True enough Caesar’s numbers are possible within dynamic coastal theory, even if it is distinctly at the lower end of the scale, but so are Pytheas’. Thus Pytheas’ circumference of Britain is a qualified guess and reinforces the likelihood of his use of the stade of 182.35 metres as Pliny’s length in Roman miles corresponds well to at least one measurement given by the Greek sources, i.e. Strabo.

Thus Pytheas the Massaliot knew the Earth was round, and his measurements likely proved this as verifiable fact, just as his observations in the north of Europe formed the core of later Greek, Roman and even Medieval and early modern beliefs about the farthest north of Europe (Small M., 2007, p. 321).

A short note on Massalia

Massalia was founded through a journey from Phokis in Asia Minor around 600 BC according to archaeological as well as historical sources (Tréziny H., 2011, p. 42; Clavel-Leveque M., 1977, p. 7). In the following centuries it became the preeminent Greek site in the northwestern part of the Mediterranean well known for its flourishing trade, and it was a node in a sea route from Greece along the Italian peninsula past another Phokaian colony, Velia, and on to Massalia, Emporion and Gades on the Atlantic coast of Iberia. As other Greek ‘apoikiai’ (i.e. “houses away from home”) Massalia existed in

a complex interaction with the native population of the region (Dietler M., 2009, p. 8–10; Hermary A. et al., 1999, p. 31–33).

Massalia's development in the first half of the 6th century BC seems to reflect that of open and dynamic emporia in the Mediterranean at the time such as Pyrgi, Emporion and Huelva (Tartessos?), possibly best understood as gateway communities (Py M. & Trézinny H., 2013, p. 238–239). As it swelled due to an exodus, yet another journey from Phokaia recently conquered by the Persians (cf. Morel J. P., 2006, p. 1728–1745) in the 540s BC, it obtained dominance of the exchange routes of southern Gaul and founded trading stations at Theline/Arelate (Arles) in the mouth of the Rhône and at Agathe (Agde) at the mouth of the Hérault connecting it with the Gironde, and thus the Atlantic facade (Hermary A. & Tréziny H., 2015, pp. 237–238).

During the 5th and early 4th centuries BC there seems to have been two realignments of the exchange routes around Massalia, one around 475–450 BC, the other around 400 BC related to the breakdown of the Hallstatt D complex in Central Europe, and both realignments were followed by Massaliot expansions, in the latter of which Pytheas journey fits well. During all three expansive periods Massaliot pottery, coins and other Greek objects spread deep into the interior of Gaul and spurred complex multilayered local developments, though Etruscan and Phoenician influences are also palpable especially in the 6th century BC (e.g., Fernandez-Götz M., 2018, p. 121–126, 148; Bizot B. et al., 2007, p. 30–31; Clavel-Léveque M., 1977, p. 20–26; Van den Boom H. / Pape J., 2000, p. 48–61; Pape J., 2000, p. 71–74, 112–119).

The richness of Massalia and its place on the edge of the world known to the Greeks (and later the Romans) led to an idea of Massalia as

a ‘soft’, effeminate and decadent society with special rites and cults (i.e. syncretism). This is famously expressed in Petronius’ *Satyricon*, and the sentiment may have had negative influence on the scientific information relayed by Massaliots such as Pytheas (Arcelin P., 1992, p. 318–319; Jensson G., 2018, pp. 11–13). This is probably the reason for the apparent ignorance of Massaliot geographical exploits in the 6th as well as the 4th century BC by the likes of Herodotus, Polybius and Strabo (Bianchetti S., 2008, pp. 23–24).

Born out of several journeys to what was then the end of the world it should come as no surprise that someone from Massalia travelled further north than ever before in the search of resources and knowledge and the end of the world, or at least the oikoumene, just as Kolaios of Samos and Aristeas of Proconessus before him.

The journey as far as the western Baltic

Pytheas probably went from Massalia along the exchange route past Emporion through the Straits of Gibraltar to Gades (Cadiz). It has often been claimed that he would not have been able to pass the Straits due to a Carthaginian blockade, but this blockade is neither evident in the abundant material on Graeco-Phoenician interaction in Iberia and Gaul, nor in the historical sources (Py M. & Tréziny H., 2013, p. 267; Bianchetti S., 2008, p. 17–20).

Then he seems to have turned south following the ocean currents, possibly to avoid the kelp forests around Cape Spartel, later turning north towards Cabo Sao Vicente, one of many so designated holy promontories of the ancient world. Then he apparently went due north to Finisterre in Galicia, probably named

Oestrymnis by the locals, meaning “westernmost”. Then he seems to have taken the direct route across the Bay of Biscay to reach Brittany, apparently also known as Oestrymnis, and settled by a people variously spelled by Strabo (Geographika 1.4.5, 4.4.1) and Stephanus of Byzantium (*Ethnoi* 712.21) as Ostidaeans, Ostidamnioi, Ostidaei, Ostiones or Oisismioi (also probably meaning something like ‘the westernmost’). Pytheas most likely knew them as Ostidamnioi. He also notes another (?) name for Oestrymnis, Kabaion, probably meaning a rock dipping into the sea, which could well be Pointe du Raz on the western tip of Britanny.

It should be noted that the route from Agde (Agathe) up the valley of the Hérault and Garonne to the Gironde, past the mouth of the Loire and the trading station Korbilon, is also a possibility (Cunliffe B., 2001; Horst Roseman C., 1994). There is also no doubt that this route was much frequented during the 3rd and 2nd centuries BC.

However, Pytheas’ journey seems in part to retrace the periplous behind *Ora Maritimma* by Rufus Festus Avienus, probably dating somewhere around 500 BC, and the aim of the journey seems to have been to establish new trading contacts in the far north as well as exploration (Bianchetti S., 2008, p. 27–29). Judging from the finds of Greek and Carthiginan coins in Wales and southern England as well as the expansion of trading centres along the English coast in the 3rd and 2nd centuries BC Pytheas’ journey was successful in this respect. The presence of Carthaginian coinage and finds also speaks toward competition in trade, not war between Phoenicians and Greeks. Further there is evidence that after Pytheas the land route was considered the more efficient one, and that it was heavily used leading to an expansion of the settlement at Agde.

Finally, one of the main arguments for the land based first leg of the journey is that Polybios through Strabo stated that the people of the trading station at Korbilon in the mouth of the Loire “had never heard of him (Pytheas)” (Strabo, *Geographika* 4.2.1). Thus invalidating the journey to Strabo, Polybios and many later researchers. However the statement only tells us that Pytheas was not at Korbilon, and since Polybios is a century and a half younger we cannot know if Korbilon existed in Pytheas’ time.

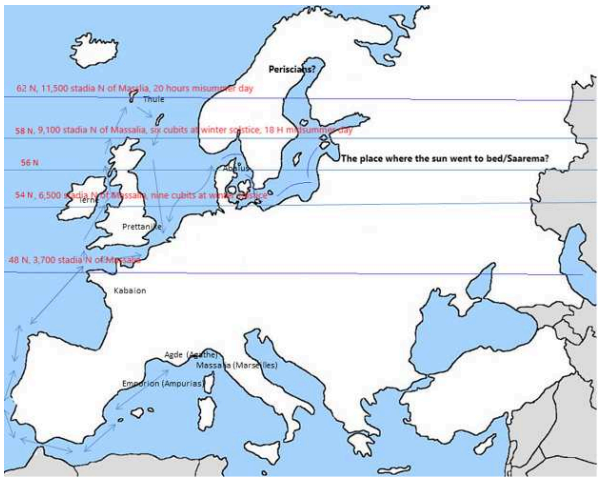

Fig. 3. Sketch map of Europe with parallels and distances indicated in stadia of 182.35 metres.

3 pav. *Eskizinis Europos žemėlapis su paralelėmis ir atstumais – 182,35 metro*

Indeed no trading settlement has been traced in the estuary of the Loire in the correct time slot, and the 3,000 stades mentioned by Pytheas for crossing from Oestrymnis to Kabaion corresponds well to the distance between the Finisterres in Galicia and Britanny (Strabo, *Geographika* 1.4.5), and for that matter also reflects the ancient Greek estimate of a ship covering 1,000 stades in one day. Further Polybius had acute interest in downplaying Massaliot exploits and enlarging his own in the face of his Roman patron, Scipio the Younger (Bianchetti S., 2008, p. 38).

Reaching Oestrymnis/Kabaion he passed Uëxisame, known to the Romans as Axanthos and today as Ile d'Ouessant or Ushant. As noted, he took a parallel close to this area. Then he probably crossed to Pretannike (Britain) from Britanny and made landfall at Land's End (Belerion), and from there he seems to have sailed north through the Irish Sea to the Hebrides (Hebudes) and on to northern Scotland and the Orkneys (Orkas). Then further north to the Shetlands (Haemodes) and, as we have seen, Thule, i.e. the Faroes. Thule probably means 'hill' or 'promontory' and since the ancient writers clearly include Thule in the Bretannides, the lesser British Isles, it is very difficult to conclude that Thule is Iceland or Norway. Indeed the Latin epitet "ultima Thule", i.e. "the farthest hill/promontory" would fit well with the Faroes.

From the Faroes Pytheas may have continued west or north, but given the distances already covered and the probably looming winter, it is more likely that he turned south and wintered at Kantion (Kent). In Kantion there is plenty of evidence for southern contacts in etymology as well as archaeology. Thus the area west of the now silted Wantsum Channel was known as the Isle of Thanet, and it has been suggested that the etymology for this name is the Phoenician goddess Tanit (Vennemann T., 2006, p. 357–359), much as Gades had a "temple of Juno" according to Pliny (i.e. Tanit). Archaeologically the strongest evidence come from Cliff's End Farm which was a liminal place with burials of people with Scandinavian, British, Mediterranean and North African descent stretching over several centuries in the Bronze and Iron Age (McKinley J. et al., 2017, p. 166–168).

From Kantion the following spring it is likely that Pytheas followed the European coastline to the north east. Thus he had the land of the Belcae to the right, probably the later Belgae,

and he passed the *aestuarium* Metuonidis, probably the marshy coast from the Schelde estuary to the Watten Sea. From here he seems to have continued north along the Jutland coast and reached Abalus, the holy island, also known as Basilia, i.e. ‘royal’. The name is cognate with Celtic *aball, Gaulish *avallo, meaning ‘apple’ and reminds us of the name of the holy island Avalon in Arthurian legend (Hawkes C. F. C., 1978, p. 9). One is also reminded of the Idun’s golden apples of Nordic mythology and the apples of the Hesperides in Greek mythology. This island is almost certainly Thy, and the Limfjord, at this time entered from the north through the Sløj Channel, and may well be “the northern Tanais”. It also seems that Pytheas explored “the land along the Ocean”, probably Norway and the “Periscians”, literally those who live around the shadow, i.e. the Polar Circle (fig. 4).

But did he also reach the Baltic and possibly even Saaremaa? Let us have a look at the archaeological, scientific and written evidence.

The scientifc and archaeological evidence – the Kaali Crater

The Kaali crater and its eight satellite craters is on Saaremaa at 58’22 N, 22’40 E. Successive radio carbon dates on various parts of the debris, wood and peat inside the crater at different levels before 1995 has produced dates ranging in 1800–600 BC (Losiak A. et al., 2016, p. 688–690; Veski S. et al., 2004, p. 198–199). Two outliers are represented by testing microspherules in nearby bogs and suggested a date of 6500–6270 BC while testing the Ir-rich peatlayer apparently connected to the formation of the bog at Piila-raba 6 km away produced a date of 400–370 BC (Rasmussen K. L. et al., 2000; Veski S. et al., 2001, p. 1367, 1371–73; Veski S. et al., 2004, p. 199). A new date from 2001 inside the main crater produced a date of 1690–1510 BC, in accordance with one of the other C14-values at 1740–1620 BC. The very latest C14-dates from the proxima ejecta give a date of 1590–1450 BC (Losiak A. et al., 2016, p. 688–690). Thus a date in the middle of the 2nd millenium BC seems to be all but certain.

Further there is comparative mythological evidence, not only from Estonia and Finland, but also from Mesopotamia, most notably the myth of Erra, Silver and Fire and in the Americas (James P. & van der Sluijs M. A., 2016, pp.70–78). It seems that the comet 2P/Encke broke in several pieces from an interpolated “proto-Encke” and may have produced frequent events of fireballs on Earth in the period 3600–1800 BC (James P. & van der Sluijs M. A., 2016, pp. 83–85). Clearly Euripides and Ovid also correlates the fall of Phaethon with some heavenly object, Ovid thus mentions the following obscuration of the sun produced by the ejecta from a meteorite (*Metamorphoses* 1.751–756) and Plato notes in *Timaios* 22c-e that heavenly objects sometimes graze the Earth and connects this to the myth of Phaethon.

Archaeologically the crater is completely surrounded by a wall made of granite blocks 2.3–2.8 m wide and 470 metres long in two clearly separate stages, one older wider and a younger, narrower version. A short section of this wall was excavated. It was not possible to closely date the finds, but the animal bones, primarily bovid, point towards sacrifices being made (Lougas V., 1980, p. 358–359).

Further there was a fortified settlement protected by a wall at least 2 m wide and 2.2 m high and 110 m in cirumference inside which was at least two buildings or platforms, a burnt layer and burnt logs as well as pottery characteristic of the late Bronze Age in Estonia and also found at nearby contemporary settlements of Asva, Ridala and Iru. There was also clay moulds and crucibles for bronze casting, amber pearls, a possible amber double button of Scandinavian type mirrored in Asva, bone awls and a bone arrowhead. Some of the ceramics may be parallelled to ceramics from Gotland and the Mälar valley. Again there was plenty of animal bones. The size and layout of the site, the walls much larger than any other on Saaremaa, and the archaeological finds, dated roughly 700–200 BC strongly sugget that it was a central place of some (ritual?) importance (Luik H. & Ots M., 2007, p. 124–126; Lougas V., 1978, 1980).

This impression is reinforced by an Iron Age silver hoard with a neck ring, a spiral bracelet and a finger ring, and medieval reports calling the place holy (Lougas V., 1978, p, 329; Veski S. et al., 2004, p. 201, 204). This later period seems to be placed in the 3rd–4th century AD. The fortified sites of Võhma and Pidula, probably of Iron Age date, are also interesting in that they seem to mimic the site at Kaali lake (Veski S. et al., 2004, p. 204).

There is thus ample evidence that the crater and its surroundings were very important

symbolically in two distinct archaeological phases. It is conceivable that the circumferential wall in two stages may reflect these two different periods of use, but it cannot be ascertained based on the available material.

That the region had widespread contacts, apart from the pottery connections mentioned above, may be shown by a Härnev type pin from Kaali and corresponding mould found at Asva, indicating either the presence of smiths from Scandinavia proper or locals trained in the Scandinavian technique as well as confirming a connection between the sites at Kaali and Asva (Haas A. et al., 2004, p. 61, 83). Besides recent research has shown Saaremaa to be quite a centre for seal hunting and the resulting products: skins, leather and blubber (Sperling U., 2013).

The wider scientific and archaeological evidence

The beginning of the site of Asva is generally dated to the Late Bronze Age (cf. Sperling U. et al., 2021), circa 850–800 BC. The Kaali site stretch across the Late Bronze Age and the Early Pre-Roman Iron Age. It may be noted that axes of Mälar type, pins of Härnev type, ceramics and bronze buttons, some times remade in bone, antler and amber (Paavel K. et al., 2020; Luik H. & Ots M., 2007), were all transported along the exchange routes in the eastern Baltic. It would seem that in the 7th and 6th centuries BC there was a westward movement of some eastern populations, and a rise in importance of Estonian sites such as Kaali, Asva and Ridala. It has even been suggested that the Scandinavian Bronze Age ended ‘early’ in Håga, Uppland through the deposition in a conspicuous position of a ceramic bowl of eastern type in the local “death house” (Eriksson T., 2022, pp. 124–126). On Saaremaa ceramic traditions from

Sweden and Poland are also visible in the local ceramics, and therefore the direction of cultural impulses cannot have been a one-way street. But Saaremaa definitely had a nodal status in the network with very close contacts to the Estonian mainland, the Mälar valley and central/eastern Poland.

Further archaeological indicators are the bell situlae from Tishkovo (Ukraine) and Keldby (Møn, Denmark) and the stamnoi from Tarnobrzeg (Poland) and Langå (Denmark). Made in the 4th century BC but, for the Danish finds apparently only deposited in the late 2nd or early 1st century BC. It is possible that these objects arrived in Denmark passing through Germany on the way. But it is also possible, even probable, that these objects arrived in Denmark through the south eastern connection to the Black Sea via the Baltic. This exchange route is also evidenced through neck rings, so-called “kronehalsringe”, and the Thracian type ear rings from Sojvide and Änge (Sideris A., 2021, p. 44; Kaul F. & Martens J., 1995, p. 121; Riis P. J., 1959, p. 22). Since the bell situlae, widely circulated in Europe, seems to have originated in Macedonia or Thrace in the 4th century BC (Sideris A., 2021, p. 44) this is a strong indicator for the continent wide contact network given the obvious close connections between Macedonia, Thracia and Scythia at this point in time.

Considering the find of mixed Greek bronze vessels from Peschanoe in Ukraine one might consider the possibility that the stamnos from Langå and the situla from Keldby may be considered parts of “a very expensive matching set” used as reciprocative gifts by a Greek explorer in the far north in the 4th century BC, and only deposited much later as heirlooms much in the way we know from the Musov burial of the late 2nd century AD or the Lefkandi burial in Greece of Geometric age

(e.g., Künzl S., 1997, pp. 41–42; Popham M. & Lemos I. S., 1996).

The exchange network and the kind of objects associated with it, all elite objects, even suggest some kind of “world system” in action. One might also cite a Bronze Age burial at Hangaskangas Oulu in northern Finland placed on an island off the coast and probably containing a “ritual specialist” of some sort and a nearby site, Halosentörmä, associated with bronze working (Herva V-P. et al., 2020, p. 90–92). This “world system” had its heyday before Pytheas, but at least parts of it seems to have functioned in the 5th–3rd centuries BC based on the archaeological evidence.

Towards the eastern Baltic - Geminos

First let us have a closer look at the Geminos quote.

Geminos. *Phainomena* 6.8-9

“6.8. Among those who live even farther north than Propontis the longest day is 17 equinoctal hours, and again among those further north 18. 6.9. It seems as if Pytheas the Massaliot actually were in these parts. He says in what he has recorded in “On the Ocean”: “Several times the Barbarians showed us the place where the Sun went to bed [...]. But it so happens that in these parts the night is very short, in some places two, in others three hours. Thus there is only a short while from sunset to sunrise”

Kosmas Indikopleustes. *Topografia Christiana* 2.18

“Pytheas the Massaliot says in ‘On the Ocean’, that while he was himself in the northernmost places the Barbarians who lived there showed

him the bed of the Sun, since there the Sun stayed with them through all the nights."

In this we are told that Pytheas writes that the Barbarians showed him the place where the sun went to bed, and this is echoed 500 years later by Kosmas Indikopleustes. This has, as mentioned in the introduction, been claimed to be a reference to Odyssey I, 22–25:

He [Poseidon] was now away and visited a far away tribe of the Ethiopians
one of the two living at the ends of the world.
Some where Hyperion sets and others where he rises,
there to receive a hecatomb of bulls and rams.

We know that Geminos had a lot of material from Krates of Mallos, who was a geographer prone to use the Homeric poems as an exegesis on his geographical teachings, including constructing a sphairopoiia to visualise his ideas (Bilic, 2012, p. 297–298), and thus we cannot be certain that the Homeric elements we think we have preserved from Pytheas have not actually been transferred through Krates first. Notably, Cimmerians, often conferred to 'the North' by Greek ethnographers are by Krates placed at both poles, and toponyms associated with Hades are placed at the south pole, such as "the marsh of Acheron" (Bilic, 2012, pp. 298–301).

So it is possible that an original observation by Pytheas may have been twisted beyond recognition to form the basis for yet another Homeric argument. But it is equally possible that Pytheas made this observation and referenced the Odyssey. Thus the six days and nights sail north of Britain for Thule could very well be a reflection of the island of the Laistrygonians in the Odyssey and the name of their capital, Telepylos, "distant gate", is even reminiscent of the most probable meaning of

“ultima Thule”, namely “farthest height” (Bilic, 2020, pp. 578–580; Bilic, 2012, pp. 319–321).

The question therefore is not whether we can assume a Homeric refrence here, but whether the allegory may also refer to a real event, such as a meteorite impact in the Baltic.

Towards the eastern Baltic – the Argonautika

In the Argonautika where we are told how the Argo entered the mighty stream of the Eridanus river.

“…...4.590. where once, smitten on the breast by the blazing bolt, Phaethon half-consumed fell from the chariot of Helios into the opening of that deep lake; and even now it belcheth up heavy steam clouds from the smouldering wound. And no bird spreading its light wings can cross that water; but in mid-course it plunges into the flame, fluttering. And all around the maidens, the daughters of Helios, enclosed in tall poplars, wretchedly wail a piteous plaint; and from their eyes they shed on the ground bright drops of amber. These are dried by the sun upon the sand; but whenever the waters of the dark lake flow over the strand before the blast of the wailing wind, then they roll on in a mass into Eridanus with swelling tide. But the Celts have attached this story to them, that these are the tears of Leto’s son, Apollo, that are borne along by the eddies, the countless tears that he shed aforetime when he came to the sacred race of the Hyperboreans and left shining heaven at the chiding of his father, [...] …sorely afflicted all day, heavy and faint at heart, with the noisome stench, hard to endure, which the streams of Eridanus sent forth from Phaethon still burning; and at night they heard the piercing lament of the daughters of Helios, wailing with shrill voice; and, as they lamented, their tears were borne on the water

like drops of oil. Thence they entered the deep stream of Rhodanus which flows into Eridanus; and where they meet there is a roar of mingling waters. Now that river, rising from the ends of the earth, where are the portals and mansions of Night, on one side bursts forth upon the beach of Ocean, at another pours into the Ionian sea, and on the third through seven mouths sends its stream to the Sardinian sea and its limitless bay. And from Rhodanus they entered stormy lakes, which spread throughout the Celtic mainland of wondrous size; and there they would have met with an inglorious calamity; for a certain branch of the river was bearing them towards a gulf of Ocean which in ignorance they were about to enter, and never would they have returned from there in safety..."

And here they are saved by Hera from the Hercynian rock (unspecified mountains in Keltike) and led past 'countless tribes' past the 'midmost mouth', that is the Rhone, and behind a 'line of islands' presumably the Iles d'Hyères some way east of Massalia, before they were finally provided a safe haven on Aethalia (Elba).

It is from this section clear that the Eridanus river in this version have three mouths, one in the Northern Ocean, the others the Rhône (Sardinian sea and boundless bay, i.e. the Golfe du Lion) and the third the Po (pouring into the Ionian Sea). As we saw above with the Rhône, the Nile and the Tanais, there is nothing strange in this idea to an ancient Greek.

The "stormy lakes" in the inner part of Keltike may be a faint reflection of the Baltic, and the "offstream bearing them into the ocean-gulf" could then be one of the three Danish Belts. The mention of Hyperboreans, Celts and Apollo supports the idea that this part of the Argonautica actually could reflect one or several real event(s).

Towards the eastern Baltic – Pliny the Elder and Ptolemaios Klaudios

Let us now have a closer look of what Pliny the Elder tells us in his *Natural History*.

The relevant section is 4,94-96 which is a mix of early Greek and later Roman sources on the European coast line from the Rhine to the "Ripaean mountains" which in this case must be considered completely mythical.

« 4.94. We must now leave the Euxine to describe the outer portions of Europe. After passing the Riphæan mountains we have now to follow the shores of the Northern Ocean on the left, until we arrive at Gades. In this direction a great number of islands are said to exist that have no name; among which there is one which lies opposite to Scythia, mentioned under the name of Raunonia, and said to be at a distance of the day's sail from the mainland; and upon which, according to Timæus, amber is thrown up by the waves in the spring season. As to the remaining parts of these shores, they are only known from reports of doubtful authority. With reference to the Septentrional or Northern Ocean; Hecataeus calls it, after we have passed the mouth of the river Parapanisus, where it washes the Scythian shores, the Amalchian sea, the word 'Amalchian' signifying in the language of these races, frozen. Philemon again says that it is called Morimarusa or the "Dead Sea" by the Cimbri, as far as the Promontory of Rubeas, beyond which it has the name of the Cronian Sea. Xenophon of Lampsacus tells us that at a distance of three days' sail from the shores of Scythia, there is an island of immense size called Baltia, which by Pytheas is called Basilia [...].
4.96. Leaving these however, we come to the nation of the Ingævones, the first in Germany;

at which we begin to have some information upon which more implicit reliance can be placed. In their country is an immense mountain called Sevo, not less than those of the Riphæan range, and which forms an immense gulf along the shore as far as the Promontory of the Cimbri. This gulf, which has the name of the ‘Codanian,’ is filled with islands; the most famous among which is Scandinavia, of a magnitude as yet unascertained: the only portion of it at all known is inhabited by the nation of the Hilleviones, who dwell in 500 villages, and call it a another world: it is generally supposed that the island of Aeningia is of not less magnitude. Some writers state that these regions, as far as the river Vistula, are inhabited by the Sarmati, the Veneti, the Sciri, and the Hirri, and that there is a gulf there known by the name of Cylipenus, at the mouth of which is the island of Latris, after which comes another gulf, that of Lagnus, which borders on the Cimbri. The Cimbrian Promontory, running out into the sea for a great distance, forms a peninsula which bears the name of Tastris »
(The English translation here slightly adapted from:
https://www.gutenberg.org/files/57493/57493-h/57493-h.htm)

In the first section we are concerned with the Jutland peninsula, that is the Cimbrian promontory, and the Amalchian, that is ‘unfrozen’ (‘a-malchos’) sea, probably the North Sea, and the Morimarusa, meaning “the dead sea”, probably the Kattegat bordered by Rusbeas, probably Lindesnes in southern Norway. Thus the westernmost part of the Baltic.

Then we enter the Baltic, apparently from the east seen from the Vistula and learn about the islands Aeningia, Latris and Scatinavia, the bays of Cylipenus and Lagnus.

Scatinavia could be Scania in southern Sweden, at least the name was later extended to cover the entire Scandinavian Peninsula. Aeningia would seem to be an unspecified landmass to the north of Vistula, possibly the Baltic countries or Finland. Then the Cylipenus would be the Pomeranian coast and Latris the island of Rügen. Lagnus would then be the bay from Rügen to the Jutland peninsula, and Tastris would be Skagens Odde. Stettiner Haff for Cylipenus, Zealand for Latris and Kurisches Haff for Lagnus has been suggested (Rasch G., 1950, p. 45, 61–62) but this makes little geographical sense if the point of view is from east towards west.

Concerning the Graeco-Roman knowledge of the far north of Europe we know that most of Ptolemaios' material was Roman imperial, but there are older elements, and it seems clear that the farthest north with Thule is among them. There are different versions of Ptolemaios' text, but some versions, such as Codex Vaticanus VF 32 clearly place what looks like a temple in the far north eastern corner of Europe at 58 degrees north (fig. 5).This could reflect a memory of a holy site on an island far to the north.

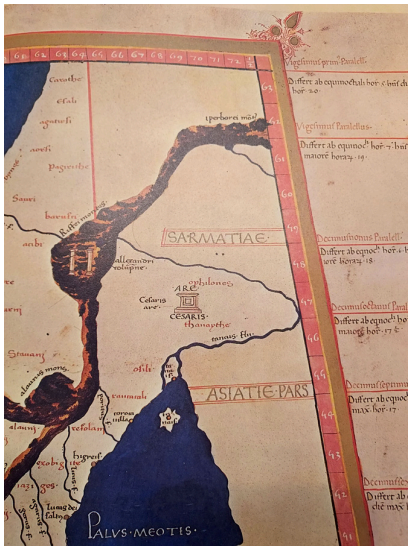

Fig. 5. Ptolemaios Klaudios, CodVat VF32. Focus on the temple (?) at 58 degrees N.

5 pav. *Ptolemajas Klaudijas, CodVat VF32. Dėmesys į šventyklą (?) ties 58 laipsniais šiaurės platumos*

Concluding remarks

In conclusion, archaeology, notably the evidence of travelling tradesmen in the Baltic in the Bronze and Iron Age, indirectly supports the idea of Pytheas the Massaliot exploring the Baltic as do the disparate written sources. This would, among the ancients, place Pytheas in the same category as Kolaios of Samos, Aristeas of Proconessus and Hanno of Carthage, all heading wide ranging expeditions searching for trade, resources and the end of the *oikoumene* as it was known to them. Further, the Homeric allusions in the corpus of Pytheas the Massaliot also seems fitting for a true travelling trader exploring the world as never before. That he backed his discoveries and allusions with remarkably precise factual information is our luck today since we are able to confirm or make probable most of his observations.

Based on this I here propose a journey of Pytheas the Massaliot that went into the Baltic along 54 degrees north (fig. 6), a parallel Pytheas would have known through his parallel taken at either Morecambe Bay, Flamborough Head or the mouth of the Elbe, and then northwards to Saaremaa at 58 degrees north, again a parallel he already knew from measuring it at Cape Wrath (fig. 3). The very precise parallels taken at 48, 54 and 58 degrees north, where two are confirmed by the solar height at the winter solstice present hard facts anchoring the other evidence as does the solar height coupled with 19 equinoctal hours at summer soltice at Shetlands and the 20 equinoctal hours and 11,500 stades north of Massalia at the Faroes.

Fig. 6. Pytheas in the Baltic? With probable identifications of names from the Pythean corpus and important archaeological sites mentiones in the text.

6 pav. *Pitėjas Baltijos jūroje? Žemėlapis su identifikuotomis ir pažymėtomis Pitėjo nurodytomis vietovėmis ir pavadinimais ir svarbiomis archeologinėmis vietovėmis, minimomis tekste*

In conclusion. It is possible to argue that Kaali on Saaremaa was visited by Pytheas the Massaliot, that he knew it as the “place where the sun went to bed” and that the myth of the fall of Phaethon is a reflection of the meteorite impact a millenium before.

This reconstruction lacks the strong corroborating archaeological and ethnographical evidence that makes it a lot easier to chart Pytheas’ journey as far as Abalus, but the journey further east is plausible and while the archaeological and written evidence are more ambiguous it is by no means an implausible reconstruction. It makes archaeological as well as geographical sense.

It is no wonder that some in the ancient world had a hard time believing in this tall tale, since it was also used in a fantastical novel called “On the Hyperboreans” by Hekataios of Abdera not much later than Pytheas in date

and in the Roman Imperial period by Antonios Diogenes in “On the wonders beyond Thule”.

A RECONSTRUCTION OF THE JUDEAN RESTORATION*

FRANK MOORE CROSS
HARVARD UNIVERSITY, CAMBRIDGE, MA 02138

THE literature dealing with the fifth and fourth centuries in Palestine appears to expand by geometric progression. I think it is fair to say, however, that little progress has been made in solving the hard problems in the history of the Restoration since the assimilation of new evidence from the Elephantine papyri published in 1911.[1] If one compares the review of literature on the date of Ezra's mission by H. H. Rowley published in 1948[2] and the review by Ulrich Kellermann in 1968,[3] one comes away disappointed; a generation of research has added at best a few plausible speculations,[4] but little, if any, hard new evidence. The scholarly procedure has been to review the same body of evidence and arguments and come boldly down on one of three dates for Ezra in relation to Nehemiah: (1) Ezra came before Nehemiah, a view we may label "the traditional view"; (2) Ezra came after Nehemiah, which for convenience we may call the "Van Hoonacker position"; (3) Ezra came during or between Nehemiah's visits to Jerusalem, the "Kosters-Bertholet view." To these we should add the position of C. C. Torrey that Ezra was a fiction of the Chronicler's imagination and, consequently, had no date. Some scholars refuse

[1] I refer in particular to *AP* 21, 30, 31, 32 (*AP* = A. Cowley, *Aramaic Papyri of the Fifth Century* B.C. [Oxford: Clarendon, 1923; reprinted, Osnabrück: Zeller, 1967]).

[4] We should place J. Morgenstern's proposals ("The Dates of Ezra and Nehemiah," *JSS* 7 [1962] 1-11) and Morton Smith's assertions (*Palestinian Parties and Politics That Shaped the Old Testament* [New York: Columbia University, 1971] 99-147) in the category of the less than plausible speculations. Smith is certainly correct, however, in recognizing that "arguments from personal names (of which Rowley makes much) are generally worthless because of the frequency of papponomy at this period, and the frequency of most of the names concerned" (p. 252 n. 109).

to commit themselves in print, and others shift back and forth between two or more views — a decade, let us say, to Van Hoonacker, a decade to Bertholet or the traditional view.[5]

The time has come, however, for the study of the era of the Restoration to take new directions. Over the last twenty years tidbits of new evidence have accumulated and now, when brought together, give new contexts or perspectives with which to approach old problems. None of these bits of new evidence is particularly dramatic or conclusive. Taken together, however, they provide new solutions which can move the present discussion out of stalemate.

The discovery in 1962 of fourth-century legal papyri executed in Samaria is perhaps the most important source of new data.[6] From the papyri we can reconstruct the sequence of governors in Samaria by virtue of the practice of papponymy, the naming of a child after his grandfather (see the appended genealogical chart). The Samaritan genealogy overlaps with the genealogies of the Judean Restoration from the sixth to the tenth generation after the return. Sanballaṭ I, the Ḥoronite, is the founder of the dynasty, as his gentilic suggests, the contemporary of Nehemiah and 'Elyašîb, as biblical references make clear, and the contemporary of the high priests Yōyada' and Yōḥanan, as we can deduce from biblical and Elephantine references.[7] The Sanballaṭ of Josephus proves to be Sanballaṭ III, the contemporary of Darius III and Alexander, the builder of the Samaritan temple on Gerizim.[8] Equally important, the sequence of Sanballaṭids makes certain what has long been suspected, that two generations are missing in the biblical genealogy of Jewish high priests.[9] This lacuna in the fourth century is supplied by Josephus, who is correct in his record that a certain Yōḥanan killed his brother Yēšūa' in the temple in the time of the infamous Bagoas, the commander-in-chief of Artaxerxes III (Ochus, 358-38 B.C.) in his expeditions to Phoenicia, Palestine, and Egypt during the western insurrections,[10] and that Yōḥanan's successor was Yaddūa', high priest in the days of Darius III (335-30) and Alexander.[11] In short, we can now reconstitute the end of the list of high priests as follows: Yōḥanan father of Yaddūa',

[5] This last-mentioned option, I must confess, is the one I have chosen. It at least has the advantage of giving variety.

[6] See F. M. Cross, "Papyri of the Fourth Century B.C. from Dâliyeh: A Preliminary Report on Their Discovery and Significance," *New Directions in Biblical Archaeology* (eds. D. N. Freedman and J. C. Greenfield; Garden City: Doubleday, 1969) 41-62. A first volume of the final report is now in press.

[7] *AP* 30:29 and *AP* 30:18.

[8] *Ant* 11.7, 2 §302-3; 11.8, 2 §306-12; 11.8, 4 §325. Sanballaṭ III died in 332 B.C., of an age to have had a marriageable daughter.

[9] 1 Chr 5:41; Neh 3:1, 21; 12:10, 22-23; 13:4; Ezra 10:6.

[10] Most of us have assumed that Josephus confused Bagoas the general with Bagoas (*bgwhy*) of *AP* 30–32, a successor to Nehemiah, as governor of Judah; it proves to be an instance of hypercritical presumption on our part.

[11] *Ant.* 11.7, 2 §302-3; 11.8, 2 §306-12; 11.8, 7 §347. Yaddūa' died, we are told (11.8, 7 §347), ca. 323 B.C. (the time of Alexander's death).

Yaddūa' father of Onias I.[12] Or in other words, in the sequence Yōḥanan, Yaddūa', Yōḥanan, Yaddūa' there has been a simple haplography with the loss of two names, in extremely easy consequence of the device of papponymy. Whether Josephus' list of high priests was defective or he merely telescoped the genealogy in writing the history of the fifth-fourth centuries, it is clear that he confused Yaddūa' II and Yaddūa' III as well as Sanballaṭ I and Sanballaṭ III with diabolical results for the history of the Restoration. Thus the Yaddūa' of Neh 12:10, 22 (Yaddūa' II, the grandson of Yōyada', the first of the name)[13] is correctly attributed to the time of Darius II (Nothus 423-404) in the Bible, and the Yaddūa' of the *Antiquities* is correctly attributed by Josephus to the time of Alexander. Similarly, we can observe that Josephus is probably correct in his remark that "Israelites" (i.e., Yahwists of Samaria) frequently intermarried with the high-priestly family in Jerusalem.[14] At least two instances must be admitted, the son of Yōyada' I, who married the daughter of Sanballaṭ I,[15] and Manasseh the brother of Yaddūa' III, who married Nikasō the daughter of Sanballaṭ III.[16] The narratives of these two marriages can no longer be regarded as the reflexes of a single instance of intermarriage. This circumstance is not unimportant in assessing the "Zadokite" character of Samaritan religion or in reconstructing the relations between Samaria and Jerusalem in the era of the Restoration. The Tobiads of Ammon appear to have enjoyed similar relations with the ruling priestly family of Jerusalem despite Nehemiah's polemics.[17]

The practice of papponymy in ruling houses of the Persian period has long been recognized. Still, new evidence for its practice has drawn our attention more sharply to its importance as a control in reconstructing genealogies. If B. Mazar's reconstruction is correct, the name Tobiah alternates over nine generations of Tobiads.[18] In a newly published Ammonite inscription the royal name 'Ammīnadab alternates over six generations.[19] Sanballaṭ repeats over six generations at Samaria, and if our reconstruction of the Judean family of high priests is correct, the name Yōḥanan (or the caritative Ḥōnay) occurs no fewer

[12] As we shall see, Onias I (ibid.) is in fact Yōḥanan IV. The name Onias is the Greek form of Hebrew Ḥōnay (byform: Ḥōnī), a typical hypocoristicon of the pattern *qutay* used for so-called biconsonantal roots. Both the name Ḥōnay and the pattern *qutay* are well known at Elephantine as well as later. Cf. M. H. Silverman, *Jewish Personal Names in the Elephantine Documents* (Ann Arbor: University Microfilms, 1967) 95-96 and references. The name Ḥōnay is, in fact, merely the caritative or diminutive of Yōḥanan. Similarly, *yaddūa'* is the *qattūl* hypocoristicon, a caritative of Yōyada'.

than seven times over twelve generations. Over against this, happily, the royal house of Judah does not practice papponymy in the first seven generations of the Restoration, giving us a measure of control over the parallel list of high priests, as we shall see.

The dating of Nehemiah's mission to 445, the twentieth year of Artaxerxes I, has not been in serious dispute since the appearance of Sanballaṭ in an Elephantine letter of 407 B.C. The new list of Sanballaṭids further confirms the fifth-century date, and finally the discovery of a silver bowl inscribed by "Qaynu son of Gašm [biblical Gešem, Gašmu],[20] king of Qedar,"[21] would appear to settle the matter finally.[22] The script of the bowl cannot be dated later than 400 B.C., placing Geshem, Qaynu's father, precisely in the second half of the fifth century B.C.

Another series of advances has been made in the developing study of the Greek versions of Ezra, notably in the recognition of the importance of the text of 1 Esdras for historical reconstruction. H. H. Howorth, C. C. Torrey, and S. Mowinckel have pioneered in these studies.[23] With the discovery of the Qumran scrolls, and their evidence for the history of Hebrew textual families, earlier views of the importance and priority of the Hebrew recension of Ezra underlying the Greek of 1 Esdras have been vindicated. The relation of the two recensions of Ezra, one preserved in the Palestinian text known from Qumran Cave 4 (4QEzra) and from the Masoretic text, the other preserved in the Alexandrian translation of an Egyptian text type (1 Esdras), has an almost precise analogy in the two recensions of Jeremiah, the long and the short, both preserved in Hebrew manuscripts from Qumran, 4QJer[a], the Palestinian text preserved in the

[20] Neh 2:19; 6:1-2, 6.

[21] The bowl was published with other finds in the Wādī Ṭumeilāt by Isaac Rabinowitz, "Aramaic Inscriptions of the Fifth Century B.C.E. from a North-Arab Shrine in Egypt," *JNES* 15 (1956) 1-9. He dates the script of the bowl to ca. 400 B.C., a date I should term correct but minimal. See also W. J. Dumbrell, "The Tell el-Maskhuṭa Bowls and the 'Kingdom' of Qedar in the Persian Period," *BASOR* 203 (1971) 33-44. The discovery of the bowl supports the fifth-century dating of an early Liḥyanite inscription from El-'Ulā (Dedan), which mentions Gašm bin Šahr and 'Abd, governor (*paḥat*) of Dedan, a dating held by Winnett and Albright against strong opposition. See W. F. Albright, "Dedan," *Geschichte und Altes Testament* (Beiträge zur historischen Theologie, 16; Tübingen: Mohr, 1953) 1-12, esp. p. 4 and n. 5. Albright's conjecture that the biblical formula *ṭwbyh ʿbd ʿmny* (Neh 2:10, 19) should be read *ṭwbyhw wʿbd ʿmny* (with the haplography of a single *waw*) is most tempting. It would not be strange at all if ʿAbd, a Persian governor of Dedan, were an Ammonite and associated on the one side with Tobiah of Ammon, and Geshem, the Arab king of Qedar.

[22] It must be observed, however, that there is evidence of papponymy in the Qedarite house. See Albright, "Dedan," 6-7.

[23] See especially Torrey's *Ezra Studies* (Chicago: University of Chicago, 1910); and S. Mowinckel, *Studien zu dem Buche Ezra-Nehemiah* (3 vols.; Oslo: Universitetsforlaget, 1964-65). The citation of 1 Esdras is from the excellent new critical edition of R. Hanhart, *Esdrae Liber 1* (Septuaginta: Vetus Testamentum graecum, 8/1; Göttingen: Vandenhoeck & Ruprecht, 1974).

later Masoretic text, and 4QJer^{b}, the Egyptian text found also in the Old Greek translation of Jeremiah. The Egyptian textual tradition is pristine, short, and follows an earlier ordering of chapters; the Palestinian textual family is expansive and conflate, with its ordering of pericopes secondary.[24] Ralph Klein has brought together the evidence for the two recensions of Ezra.[25] The Palestinian recension is conflate, expansionistic, and follows a late, secondary ordering of pericopes. It is reflected in 4QEzra, in Esdras B, a Palestinian translation by a forerunner of the school of Theodotion,[26] and in the rabbinic recension which developed into the Masoretic text. The Egyptian textual family is reflected in 1 Esdras, translated in Egypt in the mid-second century B.C.[27] In parallel passages, 1 Esdras proves on the whole to have a shorter, better text, and, as generally recognized, its order of pericopes reflects an older, historically superior recension of the Chronicler's work (Chronicles, Ezra). Most important, 7:72b through 8:12 of Nehemiah (1 Esdr 9:37-55) is placed immediately after Ezra 10 (1 Esdr 8:88–9:36). That is to say, the entire Ezra-narrative is separated wholly from the memoirs of Nehemiah. Thus it must be said that in an earlier recension of the Chronicler's work, the missions of Ezra and Nehemiah did not overlap. Moreover, in 1 Esdr 9:49 (= Neh 8:9) the name "Nehemiah" is missing in the description of the reading of the law; there is only reference to the *Tiršātā*. That the name Nehemiah does not belong here is also evidenced by the chronological problem developed thereby: thirteen years would have passed between Ezra's return and the reading of the law that he brought with him — presuming the chronology of the final edition of the Chronicler's work. In short, we must consider it a fixed point in the discussion that the Ezra-narrative has no mention of Nehemiah in its original form and that the Nehemiah-memoirs contain no reference to Ezra.[28]

1 Esdras completes the Ezra-narrative (save for a fragment at its close) now found in Neh 8:13-18, the account of preparations for and the celebration of the Feast of Tabernacles. Evidently, the end of the scroll of 1 Esdras, which became the archetype of the Greek text of 1 Esdras, was defective. The reading

[24] The evidence is fully presented by J. Gerald Janzen, *Studies in the Text of Jeremiah* (Harvard Semitic Monographs, 6; Cambridge: Harvard University, 1973). See also E. Tov, "L'incidence de la critique textuelle sur la critique littéraire dans le livre de Jérémie," *RB* 79 (1972) 189-99.

[25] "Studies in the Greek Texts of the Chronicler" (Cambridge, MA: unpublished Ph.D. dissertation, Harvard University, 1966). A summary can be found in *HTR* 59 (1966) 449; see also his paper "Old Readings in 1 Esdras: The List of Returnees from Babylon (Ezra 2 = Nehemiah 7)," *HTR* 62 (1969) 99-107.

[26] The translator of 2 Esdras is not Theodotion (*contra* Torrey), nor is he identical with the so-called καίγε recension, though he shares some of the latter's traits.

[27] See the arguments of Klein in the work cited in n. 25.

[28] The appearance of the name Nehemiah in Neh 10:1, of Ezra in Neh 12:36, and the mention of both in Neh 12:25 all stem from the hand of the editor of the final edition of the Chronicler's work (Chr_8, see below).

of the Law and the celebration of the high holidays[29] were the appropriate climax and conclusion. That one recension of the Chronicler's work ended at the close of ch. 8 of Nehemiah (i.e., at the end of the original ch. 9 of 1 Esdras) is confirmed by the text of 1 Esdras used by Josephus, who carries the story of Ezra, following precisely the order of 1 Esdras through ch. 8 of Nehemiah, including the celebration of the Feast of Tabernacles.[30] As we shall see, the Chronicler's work once circulated with only the Ezra-narrative appended. The Nehemiah-memoirs were not part of the work but were circulated separately. Josephus knew a Greek translation (no doubt Alexandrian) of the Nehemiah-memoirs quite different from the received text of Nehemiah. However, the integration of the Nehemiah-memoirs into the Chronicler's history belongs to the latest stage of revisions of the Chronicler's work and did not finally oust the earlier recension until the rabbinic recension of the first century of the Christian era became authoritative following the fall of Jerusalem in A.D. 70.

1. *Reconstruction of the List of High Priests in the Fifth Century* B.C.

We have discussed the problems of the fourth-century sequence of high priests, restoring a haplography of Yōḥanan and Yaddūa' on the basis of data from the new list of Sanballaṭids and from the *Antiquities* of Josephus. The genealogy of the priests from the sixth to the fourth centuries without the addition of Yōḥanan (III) and Yaddūa' (III) records eight generations for a period of 275 years. This yields the figure of 34.3 years per generation, an incredibly high figure. In Near Eastern antiquity, the generation (i.e., the years between a man's birth and his begetting his first-born son) is ordinarily 25 years or less. The inclusion of the priests, Yōḥanan and Yaddūa', reduces the average generation to about 27.5, still suspiciously high.

The genealogy of the Davidids gives a measure of control for the first seven generations of the Restoration and, happily, does not follow the fashion of papponymy, so that the risk of names lost by haplography is slight. In any case, it appears to be complete. The list names seven Davidids, six generations of the Restoration. These occupy a period of years from before 592 (the thirteenth year of Nebuchadrezzar), to ca. 445 B.C., the birth date, roughly, of 'Ananī, a total of 147 years. This gives the figure of 24.5 years per generation, which is close to what we should expect. Synchronisms exist for two or three of the

[29] Apropos of the high holidays, there is no reason to suppose that Ezra followed a pre-pentateuchal calendar, moving up *Sukkôt* and ignoring *Yôm Kippûr* (*pace* Morton Smith). Preparations for *Sukkôt* took more than one day.

[30] There is no allusion in Josephus to the covenant-document preserved in Nehemiah 9 (historical prologue in the form of a confession) and 10 (witnesses and stipulations). The chapters belong to the latest stratum of the Chronicler's history (Chr_3); it is not clear whether it is an expanded doublet of Ezra's covenant (Ezra 10:3-5) or represents a parallel covenant enacted by Nehemiah. The stipulations conform closely to Nehemiah's reforms. Greek Nehemiah (Esdras B) attributes the confession to Ezra (at 19:6 = Hebr. 9:6).

generations of the Davidids. Zerubbabel and Yēšūa', the high priest, are linked. Ḥaṭṭūš returned with Ezra.[31] 'Ananī, the last of the line recorded in 1 Chr 3:17-24, *may* be the 'Ananī named in *AP* 30:19 (410 B.C.); on the other hand, his brother *'wštn* mentioned in the papyrus is not listed among his six brothers in 1 Chronicles 3 by the Persian name.

The list of high priests in the sixth-fifth century, from Yōṣadaq to Yōḥanan, extends over a period of 150 years.[32] Six priests are named in the five generations giving the figure of 30 years per generation, some five years or more per generation too high. We suspect that at least one generation, two high priests' names, has dropped out of the list through a haplography owing to the repetition produced by papponymy.

Turning to the list, we note that the first three names appear to be in order. Yōṣadaq went captive.[33] Yēšūa' and his son Yōyaqīm returned with Zerubbabel.[34] Similarly, the last three names — Yōyada', Yōḥanan, Yaddūa' — seem to be correct.[35] The center of difficulties, however, is the high priest 'Elyašīb. As brother of Yōyaqīm, in the third generation of the Return, he should have been born about 545 B.C. This would make him 100 and more, when he built the wall of Jerusalem with Nehemiah,[36] and about seventy-five, when he begot Yōyada'. The key to the solution, however, is in the juxtaposition of the priests Yōḥanan son of 'Elyašīb[37] and Yōyada' son of 'Elyašīb.[38] We must reckon with two high priests named 'Elyašīb, and given papponymy, two priests named Yōḥanan. Thus we have the following sequence: (1) 'Elyašīb I,[39] father of (2) Yōḥanan I, the contemporary of Ezra, followed by (3) 'Elyašīb II, contemporary of Nehemiah and father of (4) Yōḥanan II. Evidently, one pair fell out of the list by haplography. This reconstruction solves all chronological problems. The

[31] Ezra 8:2.

[32] We reckon from 595 B.C., a minimal birthdate of Yōṣadaq, who went into captivity (1 Chr 5:41; cf. *Ant.* 20.10, 2 §231, 234; and 1 Esdr 5:5), to the birth of Yōḥanan ca. 445. In Neh 12:22 Yōḥanan (along with Yaddūa') is said to have flourished in the reign of Darius (II, Nothus, 423-404 B.C.), and he (Yōḥanan) is high priest in 410 B.C. according to *AP* 30:18.

[33] 1 Chr 5:41.

[34] The key passage, to which we shall return, is 1 Esdr 5:5-6, which dates Zerubbabel's return in "the second year," i.e., the second year of Darius I, 520 B.C. The text is slightly in disorder. It should read: Yēšūa' the son of Yōṣadaq the son of Śarayah and Yōyaqīm his son and Zerubbabel. . . ." Cf. *Ant.* 11.5, 1 §121; 11.5, 5 §158.

[35] Neh 12:10, 22.

[36] Neh 3:1, 21; cf. 13:4.

[37] Ezra 10:6; Neh 12:23.

[38] Neh 12:10, 22. It is possible, even likely, given the practice of papponymy, that 'Elyašīb the father of Yōyada' (who succeeded him) had an older son Yōhanan, who died young or for some other reason did not succeed to the high-priestly office. This would explain the intrusion of the Yōyada'-Yaddūa' sequence of names. This does not solve our problems of chronology; it still leaves a lacuna in the list.

[39] Given the change of names and the requirements of chronology, it is likely that 'Elyašīb I is the brother of Yōyaqīm, or in any case belonged to the same generation.

list of high priests from Yōṣadaq to Yōḥanan II spans 150 years, a generation averaging 25 years (see chart).

More important, it places the mission of Ezra in the seventh year of Artaxerxes I, 458 B.C.,[40] and the mission of Nehemiah in 445 B.C., the twentieth year of Artaxerxes I.[41]

2. *Editions of the Chronicler's Work*

We have noted above the evidence from 1 Esdras and from Josephus' *Antiquities* that in an earlier edition of the Chronicler's work the narrative of Ezra and the memoirs of Nehemiah were separate and that in all likelihood Nehemiah's memoirs were only attached to the Chronicler's work in its final edition. Confirmation of this view may be found now in Neh 12:23. We read: "the sons of Levi, the heads of fathers' houses, were written in the Book of Chronicles (*sēpęr dibrê hay-yāmîm*) even until the days of Yōḥanan the son of 'Elyašīb." In this text there is evidently a reference to an edition of the Chronicler's work which ended in the days of Yōḥanan son of 'Elyašīb, the contemporary of Ezra, in the fourth generation of the Restoration, according to my reconstruction. Thus this earlier edition reached only the era of Ezra and Yōḥanan I, and not to the era of 'Elyašīb II, the son of Yōḥanan I, who was high priest in the days of Nehemiah's governorship. Our conclusion that Nehemiah's memoirs were composed and circulated independently of the Chronicler's work also gives an explanation of the repetition of the list of those who returned with Zerubbabel in Ezra 2 (1 Esdr 5:7-47) and in Nehemiah 7. The Nehemiah-memoirs quote the Chronicler's work or draw on a common source at the time when Nehemiah was composed as an independent work.

The evidence for the two editions described above appears clear enough; however, there are also good reasons to posit three editions of the Chronicler's work. We shall label them Chr_1, Chr_2, and Chr_3.

Chr_3 is the final edition, made up of 1 Chronicles 1–9 + 1 Chr 10:1–2 Chr 36:23 + Hebrew Ezra-Nehemiah. Chr_2 includes 1 Chronicles 10–2 Chronicles 34 + the *Vorlage* of 1 Esdras. The two editions differ at the beginning, Chr_3 introducing the genealogies of 1 Chronicles 1–9. The latest member of the high priesthood mentioned within the Esdras narrative is Yōḥanan I, son of 'Elyašīb I (1 Esdr 9:1), and the latest member of the Davidic house named is Ḥaṭṭūš (1 Esdr 8:29). On the other hand, in the introductory genealogies of 1 Chronicles 1–9, the list of Davidids continues on two generations to 'Ananī, the contemporary of Yōḥanan II and probably also the contemporary of Yaddūa' II toward the end of the fifth century. Chs. 12 and 13 of Nehemiah refer to these two priests as well; moreover, Neh 12:22 names Darius II (423-404 B.C.) in its latest references to a Persian king. These dates in Chr_3 all stop at the same

[40] The seventh year is given in Ezra 7:7 and again in 7:8.

[41] Or more precisely, December, 445. Cf. Neh 1:1 and Neh 13:6 (the thirty-second year of Artaxerxes I, 433-32).

time, shortly before 400 B.C. These data suggest dates for Chr_2 and Chr_3, the former toward 450 B.C., the latter toward 400 B.C. or slightly later.

Other arguments can be put forth for dating Chr_3 to ca. 400 B.C. No hint of the conquest of Alexander is to be found, and perhaps more important, no reference to the suffering and chaos of the mid-fourth century B.C., when Judah joined in the Phoenician rebellion,[42] harshly put down by Artaxerxes III and his general, Bagoas.

A surprising contrast between Chr_2 and Chr_3 is in the treatment of Zerubbabel. Ezra intrudes the list of those who returned with Zerubbabel at ch. 2, making it appear that both Sin-ab-uṣur (Σαναβασσαρ)[43] and Zerubbabel returned more or less together in the reign of Cyrus. The 1 Esdras account places the list of returnees in ch. 5 after the return of Sanabassar in the days of Cyrus and after the narrative recounting Zerubbabel's return to Jerusalem in the second year of Darius.[44] This appears in a *plus*[45] in 1 Esdras and is almost surely authentic. Since we are told that Sin-ab-uṣur, the governor, returned and built the foundations of the temple, and since Zerubbabel completed the temple upon Darius' decree,[46] it is quite natural to attribute the return of Zerubbabel to the beginning of the reign of Darius. The chaos which marked the beginning of Darius' reign was the appropriate time for a return to Zion, as it was an appropriate time for prophets to arise anew and proclaim a new David and a new temple, i.e., the re-establishment of the Judean kingdom. Again, the wisdom tale of Zerubbabel's brilliance and reward in 1 Esdr 3:1–5:6 is fixed unalterably in the reign of Darius. 1 Esdr 4:56 says explicitly that the building of the temple began in the second year after he came to Jerusalem. At the same time, there is a conflict between the account of Zerubbabel's being rewarded by Darius with "letters for him and all the treasurers and governors and captains and satraps" and the Aramaic source in Ezra 5 where Darius, before answering Tattenay the "governor of 'Abar-nahara" and his companions, is said to search out his records for the decree of Cyrus. There can be little doubt that the wisdom-tale is secondarily attached to Zerubbabel and interpolated at some point into one recension of the Chronicler's work.[47]

David Noel Freedman has written a persuasive paper sketching the Chronicler's purpose.[48] If he is correct, we must posit a still earlier edition of the

[42] For the extent of the rebellion and evidence of destroyed cities in Palestine in this period, see D. Barag, "The Effects of the Tennes Rebellion on Palestine," *BASOR* 183 (1966) 6-12.

[43] As has long been argued by W. F. Albright, *šśbṣr* (Ezra 1:8, 11), *šn'ṣr* (1 Chr 3:17), and Σαναβασσαρ all reflect Sin-ab-uṣur, a well-known name-type; Sin-ab-uṣur, Sin-apal-uṣur, and Sin-aḫ-uṣur are all documented in cuneiform sources.

[44] 1 Esdr 5:6; cf. 5:2.

[45] 1 Esdr 4:58–5:7.

[46] Ezra 5:16-20; 1 Esdr 6:18-20.

[47] We are inclined to believe that this happened after Chr_1, before Chr_2, and that Chr_3 suppressed the tale in accord with his anti-monarchic, theocratic views (see below).

[48] "The Chronicler's Purpose," *CBQ* 23 (1961) 436-42.

Chronicler's work, Chr_1. He contends that "the Chronicler establishes through his narrative of the reigns of David and Solomon the proper, legitimate pattern of institutions and their personnel for the people of God; and they are the monarchy represented by David and his house, the priesthood by Zadok and his descendants, the city and the temple in the promised land. City and ruler, temple and priest — these appear to be the fixed points around which the Chronicler constructs his history and his theology."[49]

The ideology of the Chronicler found in Chr_1, i.e., in 1 Chronicles 10–2 Chronicles 34 plus the *Vorlage* of 1 Esdr 1:1–5:65 (= 2 Chr 34:1 through Ezra 3:13), calls upon the old royal ideology of the Judean kings — chosen David, chosen Zion — as that ideology has been reformulated in Ezekiel 40–48, and especially in the oracles of Haggai and Zechariah. In Haggai and Zechariah, king and high priest constitute a diarchy, son of David, son of Zadok. Zerubbabel is called "my servant" by Yahweh and told, "[I] will make you as a signet; for I have chosen you."[50] In ch. 3 of Zechariah, Joshua the priest is crowned and robed for office in the prophet's vision, and the angel of Yahweh announces: "Hear now, O Joshua the high priest, you and your fellows who sit before you ..., for behold I shall bring my servant, the Branch ...."[51] In Chr_1 "the parallel between the first building of the temple under the direction of David (and Solomon), and the second building under Zerubbabel is too striking to be accidental, and must have formed part of the original structure of the work."[52] In short, the original Chronicler's work was designed to support the program for the restoration of the kingdom under Zerubbabel. Its extent reached only to Ezra 3:13 (1 Esdr 5:65), with the account of the celebration of the founding of the Second Temple. The future is open, and the work of restoring the ancient institutions is well begun; all is anticipation.[53] Here the program or propaganda document should end.

In order to supply the full story of the completion of the temple, the editor of Chr_2 added the Aramaic source in Ezra 5:1–6:19 as the preface to the Ezra-narrative which begins at Ezra 7:1. Chr_2 still breathes some of the monarchist fire of Chr_1. Zerubbabel is called the "servant of the Lord."[54] The story of his wisdom is preserved[55] by Chr_2, and the proper order of the Ezra-narrative is kept for the most part, found now only in 1 Esdras. The Nehemiah-memoirs were introduced only by Chr_3, who, following his belief that Ezra and Nehemiah were contemporaries, created confusion by interlarding the Nehemiah-memoirs with part of the Ezra-narrative. To Chr_3 we are indebted for the genealogies

[49] "The Chronicler's Purpose," 437-38.

[50] Hag 2:23.

[51] Zech 3:8; cf. 4:14.

[52] "The Chronicler's Purpose," 439-40.

[53] Here I cannot agree with Freedman that the original story of Zerubbabel is suppressed in favor of the Aramaic source (Ezra 4:6–6:18).

[54] 1 Esdr 6:27; the parallel passage in Ezra 6:7 suppresses this exalted title.

[55] See above, esp. n. 47.

of 1 Chronicles 1–9. On the other hand, Chr_3 apparently suppressed elements exalting Zerubbabel, including his title "servant of the Lord" and the heroic tale of Zerubbabel's wisdom and piety (1 Esdr 3:1–5:2).

The primary argument which may be brought against our view of the original Chronicler's work is that the Ezra-narrative and even the Ezra-memoirs reflect the characteristic language and style of the Chronicler.[56] The argument is not compelling; a member of the school of the Chronicler (i.e., Chr_2), imitating the master's style, may easily be responsible for the similarity of style. The two editions of the deuteronomistic history provide a perfect analogy.[57] Moreover, Sara Japhet has recently attacked the thesis of the common authorship of Chronicles and the Ezra-narrative[58] with persuasive evidence of differences of style and linguistic usage. On the other hand, there seem to be distinctions to be drawn between the royal ideology of the Chronicler (Chr_1) and the final edition of his work (Chr_3). Chr_3 appears to have omitted some material which tends to exalt Zerubbabel, the anointed son of David, presumably because his movement was snuffed out and his end ignominious or pathetic.[59]

In summary we may list three editions of the Chronicler's work, Chr_1 composed in support of Zerubbabel shortly after 520 B.C., Chr_2 written after Ezra's mission in 458 B.C., and Chr_3 edited about 400 B.C. or shortly thereafter.[60]

[56] The strongest statement of this view is perhaps that of C. C. Torrey, *Ezra Studies*, 238-48.

[57] See F. M. Cross, *Canaanite Myth and Hebrew Epic* (Cambridge, MA: Harvard University, 1973) 274-89.

[58] S. Japhet, "The Supposed Common Authorship of Chronicles and Ezra-Nehemiah Investigated Anew," *VT* 18 (1968) 330-71. Some of her arguments are based on distinctions between different orthographic practice and the use of archaic or pseudo-archaic forms; these arguments do not hold, I believe, as can be seen by an examination of the two Isaiah scrolls of Qumran Cave 1, or a comparison of $4QSam^a$ and $4QSam^b$, where common authorship is certain.

[59] In "The Purpose of the Chronicler" (p. 440), Freedman argues that in the final edition of the Chronicler's work (he reckons with only two editions), there is a positively anti-monarchical, clericalist tendency. However, none of his arguments is particularly strong.

[60] The fact that all genealogies in Chr_3 end shortly before 400 B.C. virtually eliminates the popular view that Ezra followed Nehemiah in the seventh year of the reign of Artaxerxes II, 398 B.C. Of the many arguments brought forward to support the position that Ezra followed Nehemiah to Jerusalem, most are without weight. The most plausible of them, perhaps, is the notice in Ezra 9:9 that God has given "to us a *gādēr* in Judah and in Jerusalem." The term *gādēr* has been taken sometimes as a reference to the city wall of Jerusalem. It must be said that there may have been attempts to build the wall of Jerusalem before Nehemiah succeeded. This would explain his surprise at his brother Ḥanānī's report that "the wall of Jerusalem (*ḥwmt yrwšlm*) is shattered" (Neh 1:3). On the other hand, it is by no means clear that the term *gādēr* here refers to a city wall. Ordinarily, it refers to an "enclosure wall" (of fields or vineyards) or "fortifications." Thus it refers to the enclosure wall which fortified the temple (Ezek 42:7 and *gdrt*, Ezek 42:12). In Mic 7:11 the expression is used in the plural, *gdryk*, and evidently refers generally to the defenses or fortifications of a city. Specifically in Ezra 9:9, how-

3. A Sketch of the Era of the Restoration

In the first year of his reign, 538 B.C., Cyrus the Great published an edict directing the temple in Jerusalem to be rebuilt, returning the sacred vessels taken as loot by Nebuchadrezzar to their place, thereby initiating the restoration of the Jewish community.[61] The leader of the first return was Sin-ab-uṣur, the heir to the house of David, son of Jehoiachin. He is given the title *nāśî'*, which Ezekiel and his circle in the Exile preferred to *meleḳ,* "king," in designating the new David's office. Beyond the fact that Sin-ab-uṣur led a group of captive Jews to Jerusalem bearing the temple treasures, we know very little. Evidently it was a token return, for we know that a large number of Jews were flourishing in the Babylonian community under the tolerant Persian regime. Sin-ab-uṣur is credited with laying the foundations of the temple in the Aramaic source,[62] as well as being named governor.[63] Since the Persian administration frequently appointed a member of the native royal house as governor of a local state, and indeed made the governorship hereditary, there is no reason to doubt the notice. In any case, his nephew Zerubbabel succeeded to the governorship of Judah.

Zerubbabel the governor and Jeshua the Zadokite high priest, according to 1 Esdras, returned at the beginning of the reign of Darius.[64] This was a time of widespread rebellion in the Persian empire, and in Judah a nationalist spirit stirred up the populace. The prophets Haggai and Zechariah arose and gave oracles reviving the old royal ideology of king and temple. Zerubbabel and Jeshua were named the new David and new Zadok, the "sons of oil," and a program was promulgated to re-establish Israel's legitimate institutions. Above all, the prophets urged the building of the temple and envisioned the return of Yahweh's "glory" to Jerusalem, there to "tabernacle" as in ancient days. Haggai prophesied the downfall of the Persian empire and blamed the little community's troubles on their failure to build the house of God.

In support of the messianic movement the Chronicler composed a history which reviewed and reshaped Israel's historical traditions to give urgency and meaning to the tasks at hand, the restoration of the Davidic rule, the building of the temple, and establishment of the divinely appointed cult with all its kindred institutions and personnel. This first edition of the Chronicler's work is to be dated to the five-year interval between the founding of the temple and the completion of the temple (520-15 B.C.).

ever, the context is quite clear. In rhetorical parallelism, Ezra speaks of "raising the house of our God," "making its ruins stand up," and "giving us a *gādēr* in Jerusalem and Judah." As Ezekiel uses *gādēr* of the temple-fortification, so does Ezra speak of the *gādēr* of the temple. Each parallel refers to Zerubbabel's temple and its enclosure wall. The temple was, of course, a bastion as well as a sanctuary.

[61] The Aramaic text is found in Ezra 6:3-5; compare the ornamented version in Ezra 1:1-4.

[62] Ezra 5:16.

[63] Ezra 5:14.

[64] The floating piece in 1 Esdr 5:63-70 (= Ezra 4:1-5) appears self-contradictory; cf. 1 Esdr 5:1-6.

In the face of harassment by Persian officials, including the satrap of Syria, and the jealousy and hostility of peoples who surrounded Judah, Zerubbabel and his party completed the temple on 12 March 515. The service of God "as it is written in the book of Moses" was thus restored.

We then hear no more of Zerubbabel. The prophecies of glory, wealth, and peace faded away into silence. We have no hint of Zerubbabel's fate. More than half a century passes before the story of the Restoration is taken up again. This gap in the record is significant also in reconstructing the history of the Chronicler's work. When the record resumes with the narrative of the mission of Ezra, the messianic themes of the earlier narrative are no longer to be heard. Hierocracy supplants the diarchy of king and high priest. We hear nothing of the Davidic prince either in the Ezra-narrative or in the memoirs of Nehemiah.

In 458 B.C. "Ezra the priest, the scribe of the law of the God of the heaven," set out with his company of Zionists, armed only with Artaxerxes' commission, some offerings sent to the temple in Jerusalem, and the Book of the Law. Ezra's first major effort on his arrival in Jerusalem was to undertake stern action against intermarriage with foreigners, especially marriage to foreign wives. He proposed that all enter into a covenant to put away foreign wives, and the issue of such marriages, in fulfillment of the Law. Armed with royal authority to appoint magistrates and judges, he vigorously pressed the reform against all opposition. Two months after he arrived in Jerusalem, in the seventh year of Artaxerxes, in the seventh month, on New Year's Day, he gathered all the people in an assembly before the Water Gate, and standing on a wooden pulpit read from "the book of the Law of Moses." We judge this book to have been the Pentateuch in penultimate form.[65] On a second day, he read from the Law and then dismissed the congregation in order that they might prepare for the Festival of Succoth.[66]

Here ended the second edition of the Chronicler's work, the recension reflected in 1 Esdras, combining the Ezra-narrative with the older Book of Chronicles. The date of Chr_2 must fall about 450 B.C.

In 445, Nehemiah, the cupbearer to king Artaxerxes I, learned of the troubles of the restored community in Jerusalem and its defenselessness. With the king's commission as governor of Judah, he set out with a contingent of the king's cavalry for Jerusalem.[67] Spying out the city by night, he kept his own counsel as to his plans, knowing full well that his mission would be hindered by the hatred and schemes of his fellow governors round about, viz., Sanballaṭ, governor of Samaria, Ṭobiah, governor of Ammon, Gašmu, the king of the

[65] The arguments of S. Mowinckel are compelling; see *Studien zu dem Buche Ezra-Nehemia*, 3. 124-41.

[66] Mowinckel is surely right in assuming that the Day of Atonement was fully known and celebrated despite the omission of reference to it in Nehemiah 8.

[67] Josephus (*Ant.* 11.5, 7 §168) gives 440 as the date of Nehemiah's arrival in Jerusalem. The wall was completed in December, 437 B.C., according to Josephus (*Ant.* 11.5, 8 §179), two years and four months after he began.

Qedarite Arabs, and perhaps 'Abd, the governor of Dedan. Upon his announcement of plans to rebuild the walls of Jerusalem, supported by 'Elyašīb II, the high priest, he was accused by the neighboring governors of rebellion against the king. When work began the governors took action and conspired to send contingents of their troops to harry them. Nehemiah countered these devices by arming his workers, so that a worker "with one of his hands worked, and with the other grasped his weapon." Ultimately, the walls were finished in fifty-two days of labor (Neh 6:15), though work must have continued longer to complete the details of the fortifications,[68] and a service of dedication was held with processions and singing to the sound of harps and cymbals. With his primary task completed, Nehemiah returned to the king in 433 B.C., leaving his brother behind to rule in his stead. On his return he appears to have carried out a number of reform measures: enforcing the payment of tithes for the benefit of Levite

[68] See n. 67 above and W. F. Albright, *The Biblical Period* (Pittsburgh: Private Distribution, 1950) 51-52.

and singer, and preventing the violation of the Sabbath, including the hawking of merchandise by Phoenicians on the Sabbath. Like Ezra, he attempted to put an end to foreign marriage, a perennial problem, it appears. The final words of his memoirs are these: "Thus I cleansed them from all that was foreign .... Remember me, O my God, for good."[69]

The memoirs of Nehemiah here briefly summarized must have been composed and circulated in the late fifth century. Toward 400 B.C. a final editor combined the Nehemiah-memoirs with the Chronicler's work (Chr_2), prefixed a collection of genealogies (1 Chronicles 1–9) and otherwise edited the whole. Again, darkness falls so far as the Bible is concerned, and the history of the fourth century remains a virtual blank until the advent of Alexander III of Macedon.

[69] Neh 13:30-31. It is often said that it is unlikely that great Ezra so failed in his reform that Nehemiah was required to institute a similar reform. But in the Bible the great leaders, Moses and the prophets, regularly fail, or to take a closer analogy, the deuteronomistic reforms of Hezekiah and Josiah certainly were short-lived. Moreover, laws against intermarriage are notoriously difficult to enforce in any age.

RELIGIOUS TOLERATION IN CLASSICAL ANTIQUITY

by PETER GARNSEY

I

TOLERATION IMPLIES disapproval or disagreement coupled with an unwillingness to take action against those who are viewed with disfavour in the interest of some moral or political principle. It is an active concept, not to be confused with indifference, apathy or passive acquiescence.[1] In this paper I reexamine, in the light of this strong definition of toleration, the contrast commonly drawn for the world of classical antiquity between a tolerant paganism and an intolerant Christianity. Toleration implies a degree of acceptance as well as a degree of disapproval. In evaluating the attitudes of pagans to other pagans in antiquity we must satisfy ourselves, first, that ancient polytheistic systems were as open and inclusive as is often assumed, and second, that where mutual acceptance might be said to have prevailed, this was not merely casual acceptance, but entailed compromise between competing gods and rituals. Again where religions can be seen to have been seriously at variance with each other, as were the sundry pagan cults with

[1] I employ the definition of B. Crick in 'Toleration and tolerance in theory and practice', *Government and opposition: A journal of comparative politics* 6 (1971) pp 144–71; cf. P. King, in the same volume, 'The problem of tolerance', pp 172–207, and *Toleration* (London 1976). I have not however found it useful to reproduce their distinction between toleration and tolerance.

The literature on persecution in antiquity is large, whereas that dealing with toleration is insubstantial—which gives me a justification for adding to it. But see A. Momigliano in S. Humphreys, *Anthropology and the Greeks* (London 1978) pp 179–93; [J. A.] North, 'Religious toleration [in Republican Rome', *Proceedings of the Cambridge Philological Society* n s 25 (1979)] pp 85–103. Other relevant work that I have read with great profit includes [P.] Brown, ['Religious coercion in the later Roman Empire: the case of North Africa', *History* 48 (1963)] pp 283–305; 'St. Augustine's attitude [to religious coercion', *JRS* 64 (1974)] pp 107–16; *Augustine [of Hippo* (London 1967)]; [H.] Chadwick, 'Gewissen', [*Reallexikon für Antike und Christentum* 10 (1978)] pp 1026–1107. I am grateful to G. E. M. de Ste Croix for adding to my collection of references to toleration from his vast knowledge of the literature of late antiquity. My debt is substantial to these and other scholars, especially Richard Gordon, and to Myles Burnyeat and Moses Finley who showed me ways of improving an earlier draft of this paper.

Judaism and Christianity, where therefore toleration was at least in principle a possible option, we must ask how far pagan authorities and (in so far as this can be discerned) ordinary pagans were inclined to choose that option. A pertinent issue is whether any general arguments for toleration or religious freedom were produced from the pagan side before Christianity became the religion of the emperor. The existence or absence of a 'literature of toleration' may legitimately be taken as a pointer (no more) to religious attitudes and policies. The Christian church, for its part, stands accused, and convicted, of intolerance towards pagans, Jews and nonconformists within its own ranks (heretics, schismatics). But it is appropriate to ask how speedily and comprehensively the principle of religious freedom, advanced first by Tertullian at the turn of the second century AD, was abandoned once Christianity captured the throne.

II

Ancient religions, with the exception of Judaism and Christianity, were polytheistic.[2] In response to the mysterious forces of nature the ancients summoned up a throng of deities, with various, sometimes overlapping, competences. The gods were looked to by the community for protection against nature and against man. Misfortune was an infallible sign of the displeasure of the gods and the failure of men to propitiate them; few held that the gods were uninterested in men and their affairs; even fewer that the gods did not exist at all. The reality of the gods of another community was similarly taken for granted. The very existence of that community was proof not just of the existence of its gods, but also of their general satisfaction at the attentions they were receiving from the people whom they were protecting.

But the case for a tolerant paganism cannot rest on the mere recognition of and respect for gods of other communities. What counts for more is the attitude of a community to religious dissension and non-

[2] On Greek religion see [E. R.] Dodds, [*The Greeks and the Irrational* (Berkeley 1951)]; [M. P.] Nilsson, [*Geschichte der griechischen Religion* (3 ed München 1967)]; W. Burkert, *Griechische Religion der archaischen und klassischen Epoche* (Stuttgart 1977). On Roman religion, see [K.] Latte, [*Römische Religionsgeschichte* (München 1960)]; J. Le Gall, *La religion romaine* (Paris 1975); J. H. W. G. Liebeschuetz, *Continuity and change in Roman religion* (Oxford 1979); [R.] MacMullen, [*Paganism in the Roman empire* (New Haven 1981)]; [J. A.] North, ['Conservation and change in Roman religion', *Papers of the British School at Rome* 44 (1976)] pp 1–12.

conformity at home, and to the intrusion of new religious influences from outside.

Democratic Athens was responsible for the death of Socrates in 399, charged with corrupting the youth, introducing new gods and showing disrespect for the old. Moreover, the democracy may have (the tradition is suspect): passed a law against 'impiety' on the proposal of one Diopeithes and prosecuted among others the philosopher Anaxagoras and the sophist Protagoras for impiety—all in the late 430s. Protagoras' treatise began with the agnostic sentence: 'Concerning the gods, I am not able to know either that they do exist or that they do not exist, for many are the obstacles that impede such knowledge, notably the obscurity of the question and the brevity of human life.' The democracy certainly in 415 punished with exile or death a number of Athenians accused of mutilating the Herms and parodying the Eleusinian mysteries, and, in a separate but roughly contemporaneous incident, expelled Diagoras of Melos for mocking the mysteries. 'The Great Age of Greek Enlightenment', wrote E. R. Dodds, 'was also, like our own time, an Age of Persecution.'[3]

Two things should be said in explanation, though not exoneration, of the Athenians. First, it was entirely logical for a pagan political community in antiquity to be intolerant of nonconformity and protective of its gods. The polis protected its gods because the gods protected the polis. Religious deviance was dangerous in principle because it prejudiced the good relations between gods and men on which the safety of the state was held to depend. Second, the acts of intolerance listed above (there were a few other isolated incidents) are concentrated in the period of the Peloponnesian war and its immediate aftermath, a critical period for Athens and Athenian democracy. To consider only the last and best known incident, a defeated and humiliated Athens found a scapegoat in Socrates. Its choice of victim was explicable. Quite apart from the embarrassment which this 'diabolic needler'[4] had brought to individuals in public or private debate, he had played an important role in the education of traitors like the arch-oligarch Critias and the maverick Alcibiades. This last issue is alluded to in the charge of corrupting the youth. It is only an

[3] Dodds p 189. For references and source-criticism see K. J. Dover, 'The freedom of the intellectual in Greek society', *Talanta* 7 (1976) pp 24 seq Cf. the wide-ranging article of G. W. Clarke, 'Books for the burning', *Prudentia* 4 (1972) pp 67–82. Best on Socrates is [G. X.] Santas, [*Socrates* (London 1979)].

[4] Santas p 6.

allusion because the amnesty oath, taken after the Thirty Tyrants (led by Critias) gave way to a restored democracy, precluded a direct attack; the accusers fell back on charges not overtly political. The actual charges did however have strong political overtones, for secular and sacred, patriotism and piety, were inseparable in antiquity. Their gravity is not in doubt: no less an issue was at stake than the health and prosperity of the community.

Of the two religious charges, which are connected, that of introducing new deities holds a special interest for our subject. If Athenian, or Greek, religion was for whatever reason a closed system, then religious strife and compromise—toleration in fact—become possibilities, at least in principle. If on the other hand Athenian polytheism was supple and inclusive, then toleration is, strictly, an irrelevant concept. It is this latter view of ancient paganism which is normally held.

The history of pagan communities shows a pattern of change as well as continuity in the character and content of religious practice. But there never was an open-door policy, and at least in some periods strict limits were set to the willingness of any given community to receive and assimilate foreign gods and rituals. The civic cult of Athens in the classical period, for example, was expanded only in response to crisis, when a sharp downturn in the public fortunes of the community appeared to necessitate a religious innovation.

In fifth century Athens, the entry of Bendis,[5] a non-Greek deity, into the Athenian pantheon by decree is without parallel. Even the admission of the cult of the Greek hero Asclepius from Epidaurus in 420 was a rare event. The first steps in Asclepius' introduction were taken as early as 430–29, the year in which the decree for Bendis was passed. These are the years of the great plague. Asclepius was to be admitted into the Roman state cult in 293 in similar circumstances: his was the quintessential cult of crisis. Bendis, a Thracian Artemis worshipped with orgiastic rites, is the more unlikely arrival.

The well-known penchant of ordinary Athenians in the years of the Peloponnesian war for mystery religions of an orgiastic character with origins in the north and east provides only part of the explanation.[6] A political element in the decision cannot be ignored. In 433

[5] W. S. Ferguson, 'Orgeonika', *Hesperia* Suppl. 8 (1949) pp 131; Nilsson pp 833–5 (Bendis), pp 806–8 (Asclepius).

[6] M. P. Nilsson, *Greek popular religions* (New York 1940) pp 84–101.

some Thracians received permission from the Athenian assembly to acquire a site and place on it a shrine of Bendis. It was in this year that an alliance was struck between the Athenians and the Thracian king Sitalces. The timber reserves of Thrace and the proximity of the kingdom to the trade route from the Black Sea made Sitalces a highly desirable ally for Athens, a naval power dependent on grain and timber imports. The upgrading of Bendis a few years later points to the value placed on the alliance by the Athenians in the early years of the war. But without the plague Bendis would never have received a public cult. And the treatment of Bendis was exceptional.[7]

That a charge of religious innovation should have been levelled (however unjustly) against Socrates, then, becomes intelligible. The state religion of Athens *was* exclusive. In theory at any rate the pantheon was complete, and the gods of Athens did not ordinarily tolerate intruders. The promotion of Bendis by decree of the assembly was carefully prepared for by an official visit to the oracle of Dodona. Divine approval had to be won. Even the earlier concession of 433 required similar measures: it was not a trivial event, then, perhaps the first of a limited series.[8]

To return to the original question: is the language of toleration appropriately applied to the religious climate of classical Athens? I do not think so. The Athenians actively defended their gods against, as they put it, impiety (*asebeia*). The private performance of foreign cults, which could not in any case be kept out of a cosmopolitan city such as Athens was, was not attacked. But then to many or most Athenians it was quite acceptable and not felt to subvert the worship of the official gods. The 'conservative opposition's' disdain for popular religion—as witnessed for example in the banishment of Sabazios and the other foreign cults in Aristophanes' *Horai* or in the ridicule that Demosthenes heaped on Aeschines for his youthful participation in the rites of Sabazios at the side of his priestess mother[9]—

[7] The introduction of the Egyptian God Ammon by the 370s BC is a superficial parallel. But Ammon had an oracle (Delphi was frequently in the hands of enemies of Athens), he had Greek intermediaries (the Cyrenaeans), and he was closely identified with Zeus. See H. W. Parke, *The Oracles of Zeus* (Oxford 1967) pp 217–19; S. Dow, 'The arrival of Isis at Athens', *Harvard Theological Review* 30 (1935) pp 184.

[8] *IG* II^2 1283, a third century inscription, refers back to the Athenian decree of 433 which fulfilled an oracle from Dodona. *IG* II^2 337 (333–2 BC) is a decree giving traders from Citium, Cyprus, area for a shrine to Aphrodite, just as the Egyptians have one to Isis.

[9] Cic., *de leg.* 2.37, cf. Aristoph., *Wasps* 9 seq, *Birds* 875; Dem. 18. 259–61; Nilsson pp 836–7.

was essentially a manifestation of class and cultural snobbery. In any case the 'official' position could always be restated at the expense of an individual or a group whose activities had earned the public displeasure.[10] Similarly, the 'exclusiveness' of the state religion was not based on any idea that the Athenian religious heritage was incompatible with or 'truer' than that of any other community. Finally, there is no hint of a debate about toleration. Notoriously Socrates, whom many would like to see as the prototype conscientious objector, did not offer a plea for the liberty of conscience. It is a fact that no doctrine of active rights made an appearance in the ancient world.[11] The interests of the individual were not entirely neglected—in particular as citizen he was allowed the passive right of protection against the arbitrary acts of magistrates and judges—but it was taken for granted even by democratic theorists and spokesmen that the best interests of the individual would coincide with those of the community as a whole. Coincidence of interests did not mean parity of interests. The citizen was not so much encouraged to exert his individuality as reminded of his duty to abide by the customs and laws of the community. At his trial, and indeed by standing trial rather than running away, Socrates announced his submission to the authority of the city and its laws and courts.

III

Roman religion has the reputation of having been decidedly receptive to and tolerant of alien influences. Did not the Romans in the third century BC alone introduce, among other things, the Greek cults of Ceres and Asclepius, Venus Erycina from Sicily, the Magna Mater from Asia Minor, the first Secular Games for Dis Pater and Proserpina—king and queen of the underworld—and the first human sacrifice. One scholar has even seen a resemblance between Roman 'openhandedness' in religion and in the political sphere, between the adding of new gods and cults and the adding of new citizens.[12]

The admission of new gods was characteristically a consequence of the expansion of Rome. Some gods, for example those of states

[12] North p 11. For innovations in general, Latte pp 213–63.

whom the Romans were bent on destroying, were simply annexed. The Romans were skilful at inventing institutional mechanisms to defuse the issue of god-snatching. One such was the quaint ritual of *evocatio*.[13] The gods of an enemy were 'summoned out' of the besieged city; their 'abandonment' of the community they were supposed to protect, in response to the offer of 'the same or even more splendid worship among the Roman people', sealed the fate of the city. This rite, which took the form of a contract between the Roman attackers and the gods, more particularly the tutelary god, of the doomed city, was turned against cities in Tuscany, notably Veii, the city in southern Etruria which blocked Rome's advance to the North; it may also have been brought into service against other Italian communities; it was certainly revived for the final, spectacular, destruction of Carthage in the middle of the second century BC. Other stratagems were developed for other situations. One was *exoratio* by which gods were induced to change sides but not homes. It suited the Romans to afford some defeated opponents continued existence and a measure of autonomy. Local cults and rituals were permitted to continue. The religion of a defeated state could do no harm for like the state itself it had lost its sting. In favoured cases the Roman state cult was expanded to accommodate it.

Another setting for the admission of foreign cults is familiar to us from the Greek context. In times of emergency the Romans were driven to religious experiment under the direction of the Sibylline books and their official interpreters. The invasion of Hannibal led to an extraordinary series of innovations, designed to restore the *pax deorum*.[14] The climax came in 205 when the Decemvirs discovered an oracle in the Sibylline books to the effect that 'if ever a foreign foe should invade the land of Italy, he could be driven out of Italy and defeated if the Idaean Mother should be brought from Pessinus to Rome'. This was the Great Mother of the gods, or Cybele, a Phrygian goddess whose worship was marked by ecstatic dancing culminating, at least when practised at the cult centre of Pessinus, in self-castration. One would like to know how much advance knowledge Roman senators had about the cult which they so clearly coveted. When the goddess arrived they quickly banned Roman citizens from her procession and the attendant ceremonies, which were

[13] See R. Ogilvie, *Commentary on Livy I–V* (Oxford 1965) pp 674 seq. Citation from Pliny, *hist. nat.* 28.18.

[14] Latte pp 251–62; citations from Livy 29.10, Dion. Hal. 2.19.5.

shorn of their more extreme elements. 'So cautious are they', wrote Dionysios of Halicarnassos, 'about admitting any foreign religious customs and so great in their aversion to all pompous display that is wanting in decorum'. Concerning the manner of the removal of the goddess from Asia Minor there is doubt on several points, in particular on the part played by Attalos king of Pergamum, friend but not official ally of Rome, and the circumstances surrounding his handing over to the Romans of the black stone, apparently a meteorite, which represented the goddess. There are echoes here of *evocatio*, especially as a feature of that rite appears to have been the physical removal of the cult statue of the deity who was held to have changed sides.

Livy's account implies that Roman senators made a connection at the time between this case and the summoning of Asclepios from Epidaurus at the time of a prolonged epidemic in Rome in the late 290s.[15] On that occasion the Roman ambassadors brought away (no doubt together with the rest of the cult apparatus) a serpent which passed for the god himself. In later times the story that the god came of its own free will achieved popularity: understandably, since the voluntary accession of a god was confirmation of Rome's greatness. Contemporary Greeks presumably saw the affair as a straightforward act of *Machtpolitik*.

Thus far in discussing the attitude of Romans to foreign cults there has been no temptation to introduce the concept of 'toleration'. Roman-style polytheism was disposed to expand and absorb or at least neutralize other gods, not to tolerate them. The admission into the state cult of a captive and tamed Magna Mater does not break the pattern.

The Romans remained deeply suspicious of exotic mystery cults. The brutal attack on Bacchic rites in 186 BC—less than two decades after the importation of Magna Mater—was not out of character.[16] Bacchus was not a recent arrival in Rome and Italy. But the worship of the god had taken on new elements which were bound to attract the hostile attention of the state authorities: it was not merely the orgiastic rites, described and no doubt embroidered by an indignant Livy, which offended, but also and more importantly the cell structure, marked by an oath of membership, a common treasury, a broadly-based following and a hierarchy of lay officials as well as a priesthood. The whole organization was in effect autonomous, re-

[15] Latte pp 225–7.
[16] North 'Religious Toleration' with bibliography

moved from the supervision and control which the state expected to exert over religious activities. It is hardly surprising that it was regarded as subversive and that the rites of Bacchus were only allowed to survive in an emasculated form.

The Bacchanalian affair can be regarded as a turning point in the religious history of the Roman state. It marked the appearance within the Roman community itself of the first of a succession of specifically religious organizations devoted exclusively to religion, culminating in Christianity. None of these (basically oriental) cults were invited guests—there was, significantly, no successor to Magna Mater for a long period—but on the other hand there was no way in which their entry could be barred. What was the Roman response?

One option that was in principle available was systematic persecution. It was not taken up. A lapse into active persecution was always a possibility as is demonstrated by the periodic expulsions of Chaldaeans, Isis-devotees, Christians and Jews—even Jews, who at least from the period of Julius Caesar's ascendancy enjoyed a privileged status in Rome. But for the most part, religious organizations that were unauthorized, that were viewed as out of step with the *mos maiorum* or just illegal, were 'allowed' to exist because there was no way of excluding them or stamping them out. 'Toleration by default' would seem a possible, if charitable, description of the attitude of the Roman authorities. It would be more in line with our definition of toleration to say that governments showed by their inaction an appreciation of the limits of their power or a passive acquiescence in the presence of cults which they could not control. The Jews are the exception that proves the rule. In a letter of Julius Caesar to the city of Parium quoted by Josephus, the dictator instructs the Parians to permit the Jews resident in their city to carry out their traditional rites and practices, pointing out that he himself had excused only Jews from his general ban on *thiasoi*, religious associations, in Rome.[17] As to Christians, Trajan's famous ruling[18] that they were not to be hunted down (*non conquirendi sunt*) did not create a privileged status for Christianity, and certainly does not amount to a policy of toleration. Christianity was never an authorized religion—

[18] Pliny, *Ep.* 10.97. For the position of Christianity with relation to the state see G. E. M. de Ste Croix, 'Why were the early Christians persecuted?' in M. I. Finley ed *Studies in Ancient Society* (London 1974) pp 210–49; *The Class Struggle in the Ancient Greek World* (London 1981) pp 396–405; 419–41, etc.

religio licita, in Tertullian's phrase;[19] in fact simply being a Christian was an offence. The claim that theirs was the one true religion, their active proselytism and their obstinate refusal to participate in the imperial cult meant that Christians were always vulnerable to the charge of disloyalty to emperor and state.

But at least we can use the term 'toleration' in good conscience with respect to the Jews. The Jewish religion was disliked by Romans of Caesar's class and generation,[20] it was incompatible with the *cultus deorum*, but it was nevertheless given official sanction. The Roman *beneficium* to the Jews, however, was not secure; it had to be renewed with every change of government. Moreover, those Romans who were friendly to the Jews were guided primarily by political considerations, not moral principles. And the initiative always came from the Jewish side.

Toleration for the Jews had its origin in the attempts of the Jews of Judaea to free themselves from Seleucid control, and specifically in the approach of Judas Maccabee to the Romans in 161 BC in the aftermath of the persecution of Antiochus IV, culminating in the attempt to convert the temple of Yahwe into a temple of Zeus. Interference in the ancestral cults of a nation on this scale was 'unheard of in the Greek-speaking world from immemorial times'.[21] The Roman senate received the Jewish envoys and agreed to a declaration of friendship. The senatorial decree, a copy of which went back to Judaea, was engraved on bronze tablets and set up in the Capitol. Jews and Romans were drawn together by strategic considerations, which on the Roman side consisted in a desire to embarrass and weaken Syria. The pattern was repeated in the following century in the civil war period, when first Julius Caesar and subsequently Octavian (later Augustus) received valuable military assistance from the Jews. Caesar cashed in on Jewish resentment at Pompey's outrageous conduct in violating the Holy of Holies after besieging and taking Jerusalem; while Herod moved faster than most after the

battle of Actium to join the winning side. The reward was a series of official edicts and letters instructing their recipients—Greek cities in the East—to allow the Jews resident in their cities to live in accordance with their traditional customs and laws.

Three points are worth noting about the documents. First, they came about as a result of Jewish initiative. Shrewd, energetic and on the whole effective diplomacy, built on a close personal relationship between Jewish and Roman leaders, is a striking feature of the hundred years from Caesar to Claudius, carrying the Jews through even the crisis years of the reign of Gaius—when the Jews were compelled to play their last card, a threat to lay down their lives *en masse* in defence of their religion and way of life. Second, the documents are numerous—and presumably Josephus' dossier is not complete—and repetitious. But this is an indication of not so much Roman enthusiasm as Greek hostility. The letters and edicts of Caesar, Augustus and Claudius were a direct consequence of anti-Jewish sentiment and activity in provincial cities in the Greek East. Toleration rested on an ephemeral foundation if it had to be constantly reasserted. Moreover, Jewish credit inevitably wore thin, as rulers who had been the private beneficiaries of Jewish support gave way to others who lacked cause for gratitude and were more inclined to see Jews as trouble-makers. Third, the documents regularly acknowledge that the Romans are extending privileged treatment to the Jews because of services rendered. And that is all. No further motivation or justification is offered. There is an absolute lack of any apologia for religious pluralism or religious freedom. The Jewish right to their ancestral customs is not built up into a general principle applicable to every *ethnos* (people) let alone every individual.

Nor does anything of the kind surface in pagan literature as a whole. It is particularly noteworthy that the philosophical sceptics were barren of ideas in this area, unlike some of their successors in the sixteenth or seventeenth centuries, who developed rationalistic arguments for toleration on the basis of the uncertainty of religious knowledge.[22] Cotta, who acts as the spokesman of the Academic Sceptics in Cicero's *de natura deorum*, energetically refutes the sundry philosophical proofs of the existence of the gods and the various dog-

[22] The main classical texts are Cic., *de natura deorum* and *Academica*, and Sextus Empiricus, *Outlines of Pyrrhonism* (*P. H.*). For later sceptics see R. H. Popkin, *The history of scepticism from Erasmus to Spinoza* (Berkeley 1979); [Q.] Skinner, [*The Foundations of modern political thought* (Cambridge 1979)] esp vol 2, pt 3, ch. 8.

mas about their character, but then falls back upon the assertion of an undogmatic belief in the Roman ancestral religion, which he announces himself fully prepared as a pontiff to uphold.[23]

Cotta's position finds an echo in pre-Cartesian sceptics such as Montaigne. Montaigne's sceptical attitude to proof in the area of religious belief coexisted with a firm and conventional Catholicism. The liberal humanists of a sceptical bent were in general sincere believers. On the issue of persecution they typically equivocated. Montaigne, for example, was a supporter of religious unity but an opponent of persecution. The ancient sceptics make no statement about persecution and toleration. Cotta's stress on his obligation as a religious official to protect the state religion implies, among other things, a readiness to limit the religious choices of Romans, or at any rate those of Romans of Rome and Italy. Disapproval of atheism is similarly implicit in the references in the same treatise to the sentences passed on such as Protagoras and Diagoras and the attack on Epicureanism for undermining religion. But atheism was a peripheral phenomenon in antiquity.[24] Oriental cults, indeed all non-Roman cults, are largely ignored in the *de natura deorum* and also in the work of Sextus Empiricus, the main source for Pyrrhonian as opposed to Academic Scepticism. Sextus notes that local sacrifices and ritual practices are diverse, but this is merely to prepare the ground for the sceptical decision to suspend judgment 'as to the natural existence of anything good or bad or (in general) fit or unfit to be done'.[25] He can be said to have tacitly accepted but not openly advocated religious diversity. Roman government attitudes, as we saw, were no different. The emperors in their edicts showed a disinclination to lay down general principles. In the absence of such statements, it is permissible to attribute to Rome's leaders nothing more grandiose than an appreciation of the distinctness of the different peoples who made up their empire, combined with an implicit recognition of their inability to control their subjects beyond a certain point and the unwisdom of rousing local passions.

IV

Arguments for religious toleration, when they do emerge in antiquity, are part of a response to active or threatened persecution or intolerance from those under attack. Jewish apologetic is not very creative in this area. It sets for itself the limited objective of gaining protection for Jewish religion and culture, and employs to this end specific arguments relating to the nature of the Jewish religion, its piety, high moral standards and ancient origins, and to the record of Roman recognition and favour and Jewish support and loyalty. Only one writer puts forward arguments of broader significance—Josephus. In a speech[26] given by Josephus to Nicolaos of Damascus before Augustus' lieutenant Agrippa, the platitude 'for each community (*ethnos*, *polis*) its own ancestral customs' is transformed into a prescription which an imperial government could not ignore without jeopardizing not only civil order (for the Jews will fight to the death) but also the prosperity of the whole empire. The index of prosperity which Nicolaos offers is precisely the ability of every community to follow its ancestral traditions without harassment: 'And the happiness that the whole human race enjoys, thanks to you, we measure by the fact that it is possible for people in every country to live and prosper while respecting their own traditions'. This prosperity moreover has a divine underpinning, it is a reward for those who tolerate. As Nicolaos goes on to say: 'For if the Deity delights in being honoured, it also delights in those who permit it to be honoured.' Agrippa was ultimately persuaded by more tangible factors, in paricular, Herod's friendship and the calculation that confirming Jewish privileges would not 'cause the Roman government any trouble'—the ultimate criterion. Yet it would be a mistake to underrate the appeal of Nicolaos' argument. This was a world in which all alike, pagans, Jews and Christians, thought that the fortunes of men and states were dependent on divine goodwill.

The argument of Nicolaos is bold but slippery; it depends on the premise that religious freedom for Jews and their enemies (Greeks) could be put on the same level, that in each case it was a *beneficium* (privilege or favour) which was revocable. This is false. The local cults (and especially the civic cults of the poleis) were not at risk, unless as in the case of the Druids they offended against Roman sacrificial rules. And the Jews did present special problems, both abroad,

[26] Jos. *Ant. Jud.* 16.31–57.

where they breached the unity of the polis, and at home, where they sought to exclude all other religions. In a later passage[27] Josephus, this time speaking in the first person, again glosses over the 'awkwardness' of the Jews, but this time argues for mutual tolerance by pleading shared moral values. It is not differing customs that truly divide men, that are the essence of 'foreignness', but contrasting moralities. Josephus is optimistic: 'goodness (*kalokagathia*) is common to all men and alone enables society to endure'. The tactic is not unlike that employed by Castellio, Professor of Greek at Basle and opponent of Calvin in the mid-sixteenth century, when in the anonymous treatise *de haereticis* he made a plea for toleration between Christians on the basis of the common ground that they all shared, 'the gold coin which is everywhere acceptable, no matter what the image'.[28] Josephus' idea lacks a precise parallel in ancient thought, and in so far as he is ascribing virtue to ordinary humanity, it is decidedly anti-philosophical.

Early Christian apologetics has as its standard themes the unique truth of Christianity, the harmlessness and innocence of Christians, the folly of pagans, and the iniquity of Jews. When the injustice of persecution is brought up, the argument quickly disintegrates into a threat of divine judgment.[29] Tertullian, an African of the late second and early third century AD, breaks new ground. In the *Apologeticus* 24.5 he writes:

> Look to it, whether this may also form part of the accusation of irreligion—to do away with freedom of religion (*libertas religionis*), to forbid a man choice of deity (*optio diuinitatis*), so that I may not worship whom I would, but am forced to worship whom I would not. No one, not even a man, will wish to receive reluctant worship.

and in the *ad Scapulam* 2.2. we read:

> We worship the one god whom you all know through nature; it is his thunder and lightning at which you tremble, his blessings in which you rejoice. The rest you think are gods, but we know are demons. Nevertheless it is ordained by both man-made and natural law that each person may worship whatever he wishes, nor does one man's religion either injure or benefit the next

[27] Jos., *Ant. Jud.* 16.174–78.

[29] e.g. Justin, *Apol.* 1.68.

> man. It is however not for religion to compel religion, which is something to be taken up voluntarily not under duress. Sacrifices are demanded only of those willing to perform them. You will render no real service to your gods by compelling us to sacrifice. For they can have no desire for sacrifices from the unwilling, unless they are animated by a spirit of contention, which is a thing altogether undivine.

About a hundred years later another African, Lactantius, reacted to the Great Persecution of Diocletian with an expanded version of Tertullian's statement.[30] This is a summary of his arguments:

1. Religion is not something that can be imposed: 'There is nothing so voluntary as religion.'

2. Persecution is a violation of both human and divine law.

3. There follows a moral/linguistic argument: persecution is bad; religion is by definition about the good: *Necesse est bonum in religione uersari, non malum*. It is, as it were, a contradiction in terms to persecute, to do evil, in the name of religion.

4. Persecution is not good for the persecuting religion, in three ways:

> 4.i The gods won't welcome the sacrifice that is forced out of the unwilling, because it is in effect a curse, *execratio*, not a sacrifice.
>
> 4.ii If you try to defend religion by bloodshed, torture, evil, it will be polluted and violated, not defended.
>
> 4.iii Those who persecute will receive their just deserts. God, to whom it falls to punish those who despise him (for that is not our job), will do so, just as surely as he will avenge the toils and injuries of us his servants. (This is spelled out in grisly detail by the same author in *de mortibus persecutorum*.).

5. There is another way. It is to talk things out, to use debate (*oratio*) and persuasion (*hortamenta*). The debate might well be public. Let us call the pagan priests to a public meeting (*contio*) and give them the chance to urge us to take up their religion. We will listen. We don't want anyone to worship our god, the god of all, against their will; and if anyone refuses, we don't get cross. They ought to be like us: out style is to die rather than kill, to be patient rather than cruel, faithful rather than criminal.

None of this sounds very sophisticated to modern ears. We have a bald statement of principle, the beginnings of an empirical argument—persecution is bad for the persecutor—and an alternative

[30] Lactantius, *Inst. Div.* 5.19.9–24; 5.20.7–10; *Epit.Inst. Div.* 47 (52).3–49 (54).7.

strategy—argue it out. It is however a fresh start. The sources of Tertullian are an unsolved and probably insoluble problem. Tertullian's 'no one, not even a man, will wish to receive reluctant worship' recalls in Josephus 'They are not grateful for honours conferred under compulsion and constraint' (referring to Roman emperors).[31] But Tertullian has turned an empirical observation into a general principle and in so doing coined a phrase: *libertas religionis*. His 'religious liberty', moreover, is an attribute of individuals, not the exclusive possession of an *ethnos* or *polis*.[32] The breeding ground of this idea is perhaps the tension, which receives its first exposure in St Paul's writings, between the authority of individual conscience and the wisdom of the Christian community.[33] At any rate, it does seem to be a breakthrough that only a Christian could make, because the Christian, notoriously, had abandoned his ancestral tradition and embraced a supranational universal religion. Finally Tertullian has firmly rooted his doctrine in both human and natural (or divine) law; compare Nicolaos' tentative suggestion that the free exercise of *ta patria* has divine approval. There seems no escape from the hypothesis that the mind at work was in fact Tertullian's. This is not as unsatisfactory a solution as it may sound, since his work as a whole is full of novel argumentation, even if the quality is variable.

The Christian contribution to toleration theory peters out with the cessation of persecution and the upturn in the Church's fortunes. For example, Ambrose is capable of mouthing the precepts that religion is not to be forced and that everyone has the right to defend and practise his religion, but the remarks are intended merely for the ears of a raw fourteen-year-old emperor, Valentinian II, it is *his* 'right' to stand by his Christian faith (and by extension, to uphold his brother Gratian's anti-pagan actions) which Ambrose claims to be defending (*Ep.* 17.7). Ambrose's aim is to persuade Valentinian to *reject* the option of toleration—for which, incidentally, his favoured word is *dissimulatio,* pretence. Themes introduced by Tertullian and Lactantius

[31] Jos., *c. Apion* 2.73.

[32] I emphasise 'exclusive'. Tertullian was of course capable of employing the familiar argument more appropriate to Jewish apologetic that all others (who turn out to be *provinciae* or *civitates*) are permitted their gods; e.g. *Apol.* 24.7–10; cf. Athenagoras, *Embassy* 1. Both Geffcken's criticism and Crehan's defence of Athenagoras miss the point. See J. H. Crehan, *Athenagoras: Embassy for the Christians* (Trans and comm London 1956) at p 123. The standard works on Tertullian do not appear to notice the innovation which I have signalled above.

[33] Chadwick, 'Gewissen' pp 1066 seq.

were also utilized by Donatists.[34] In particular, they stated much more clearly than their predecessors had done that to advocate and practise coercion was to fly in the face of traditional Christian doctrine. Their criticism of the church establishment not only for favouring persecution but also for calling in the legislative and coercive arms of the state provoked Augustine into developing a doctrine of 'just persecution'. Donatists were not averse to appealing to imperial enactments for their own purposes, specifically, to justify their suppression of the Maximianist schism in 393–4, and their main tactic against orthodox coercion was not argument but violence. Insofar as they resorted to argument, they were mainly concerned to press their claims to be the Catholic Church, and were not much inclined to fall back on the essentially defensive strategy of setting up a debate on toleration. This can be said of all Christian sects in this age of religious fervour and fanaticism. Few Christian writers reveal a non-sectarian spirit. We might single out Socrates the ecclesiastical historian, who frequently expresses distaste for bigotry and strife, which is contrary to the spirit of Christianity and disturbs the peace of the Church and the world;[35] or Salvian, bishop of Marseilles, who excuses barbarian heretics (they were Arians) on the grounds of ignorance and inferior instruction, and even suggests that they may not fare badly on the day of judgment;[36] or the shadowy Pseudo-Dionysius the Areopagite who argues in the sixth century for instruction rather than punishment for those in ignorance and error, basing his case on the mildness and mercifulness of Jesus.[37] These are, however, peripheral figures compared with Ambrose and Augustine who dominate the debate with pagans and dissenting Christians in the crucial late fourth and early fifth centuries AD. Meanwhile it is worth pondering the fact that our three conciliatory authors, and other Christians who take a similar line, were writing after the Christian church committed itself irrevocably under Theodosius I to a policy of persecution in alliance with the state.

[34] Donatist arguments are mostly buried under the massive weight of Augustinian scholarship. But see the useful reconstructions of P. Monceaux, *Histoire littéraire de l'Afrique Chrétienne* (Paris 1920) 5 pp 309–39. The best discussion is in P. Brown, *Augustine of Hippo* (London 1967) chs 19–21, esp 21. W. H. C. Frend, *Donatist Church* (Oxford 1952) remains a classic; see ch 20.

[35] Socrates, *HE* 7.15; 1.23.

[36] Salvian, *De Gub. Dei* 5.2.5–11.

[37] Ps.-Dionysius, *Ep.* 8.5 (MPL 3.1096C–7B). Translation by R. F. Hathaway, *Hierarchy and the definition of order in the letters of Ps.-Dionysius* (The Hague 1969) 148–9.

From the preceding age, between the collapse of the persecution of Christianity and the inauguration of the persecution of paganism, a period when Christian emperors on the whole pursued a policy of toleration, no justification of this policy survives beyond that offered by Constantine (and Licinius) in the so-called 'Edict of Milan' of 313.[38] Of special interest in the Edict are the fleeting evocation of an eirenic motive for toleration:

> Your Devotion understands that to others also freedom for their own worship and cult is likewise left open and freely granted, as befits the quiet of our times.

and the assumption—which seventy years later Ambrose would resoundingly reject—that toleration would be pleasing to God and would guarantee the prosperity of the realm:

> Our purpose is to grant both to the Christians and to all others full authority to follow whatever worship each man has desired; whereby whatsoever Divinity dwells in heaven may be benevolent and propitious to us, and to all who are placed under our authority.

In a second pronouncement of 324[39] issued after the defeat of Licinius, Constantine has abandoned his respect for non-Christian worship, and is now openly contemptuous of the error of those who practise it. But they are still free to do so:

> With regard to those who will hold themselves aloof from us, let them have, if they please, their temples of falsehood: we have the glorious edifice of the truth. We pray, however, that they too may receive the same blessing which thou hast given in accordance with thy nature, and thus experience that heartfelt joy which unity of sentiment inspires.

This prayer for the salvation of the pagans contrasts strangely with the dark threat of imminent heavenly medicine in the document with which the emperor wound up his fruitless persecution of the

[38] See Eusebius, *HE* 10.5.1–14 with Lactantius, *De Mort. Pers.* 48.1–12.

[39] Eusebius, *Vita Const.* 2.56. T. D. Barnes, *Constantine and Eusebius* (Cambridge Mass. 1981) pp 209 seq, has recently revived the contention that Constantine had earlier in 324 revoked the policy of toleration in an edict which among other things banned pagan sacrifice. He rests his case on Eusebius, *Vita Const.* 2.45. A. H. M. Jones, *Later Roman Empire* (Oxford 1966) 1 pp 91–2, also believes in this law, but is unimpressed by the Eusebius text, preferring to argue from *CTh.* 16.10.2, 341 (Constans and Constantius II). On the other side, H. A. Drake, *In Praise of Constantine* (Berkeley 1975) pp 65–6, attacks only the text in the Code. It would be easier to believe Eusebius, and the sons of Constantine, if the alleged law had been quoted, and if it could be reconciled with the friendlier document issued subsequently.

Donatists three years earlier.[40] For Constantine heretics and schismatics were wicked and criminal, pagans merely in error.

Here he was merely echoing conventional ecclesiastical wisdom. *Hairesis*, a neutral word meaning, in relevant usages, 'school of thought', received in a Christian context the derogatory sense of a school of thought which deviated from the orthodox line dictated by the Church. Pagans could never have given the word this twist; their religion was a matter of ritual and worship, not doctrine. Heresy was from New Testament times regarded as a stain on the image of the Church, even if there was little agreement on what heresy was.[41] The readiness of Christians to dispute amongst themselves over matters of doctrine and discipline was noticed and exploited by pagan apologists from Celsus onwards, and Augustine in a moment of candour acknowledged that Christians in North Africa could learn something from the cohesiveness of the pagan communities.[42] He did not it seems make the deduction that tranquillity could be achieved through mutual toleration. Similarly, Origen, who is found candidly admitting in his reply to Celsus that in matters of morality and religion unanimity was impossible, in another work ranks orthodoxy above piety. Ironically, Origen was not himself considered a model of orthodoxy.[43]

To return to Constantine: there was not felt to be any contradiction in his persecuting dissenters within the Church and tolerating pagans. There had been no practical possibility of persecuting heretics before. A Christian emperor had the means to repress, and had no choice but to repress, to preserve the unity of the Church, to assert the indivisibility of the body of Christ. The suspension of persecution of Donatists in 321 was a tacit acknowledgement of the limits of power; it did not lead to a policy of toleration, let alone reconciliation. A renewal of persecution was always in prospect.

Paganism, however, was tolerated in the period from Constantine to Gratian. Emperors were tolerant in deed, if not always in word.

[43] Origen, *in Mt. comm. ser.* 33, Chadwick, 'Gewissen' p 1098; cf. Tertullian, *monog.* 2.3 (another heretic).

Constantius issued general prohibitions of sacrifice but did nothing to have them enforced; it was as if merely by issuing anti-pagan legislation he had salved his conscience and appeased God.[44] The essential fact is that the pagan priesthoods of the state cult, the augurs, flamens and vestals, continued to receive their subsidies, Christian emperors bore the official pagan title of *pontifex maximus*, and the worship of dead emperors was allowed.

It is often assumed that a degeneration of pagan-Christian relations was inevitable: an aggressive monotheistic religion would inevitably descend to active persecution once it had convinced itself of the likelihood of success, once it had persuaded the political authorities to turn the full coercive apparatus of the state against its rivals. Ambrose is usually branded the villain of the piece, the powerful bishop of Milan of whom it was said even the devil was afraid, who intimidated weak emperors, forcing them to disestablish the pagan cults and then suppress them. But what of the emperor Julian, at least the equal of Ambrose in fanatical zeal and strength of personality (to the chagrin of the moderate pagan historian Ammianus Marcellinus), whose shortlived pagan reaction put the wind up the Christian establishment? Until the reign of Julian peaceful competition with paganism had seemed a winning strategy, and justifiably: with the authority and financial resources of the emperor behind the Christians, the contest had been unequal.[45] Julian, to be sure, professed to be uninterested in persecuting Christianity: 'It might be proper to cure them, even against their will, as one cures the insane, except that we concede indulgence to all for this kind of disease. We ought I think to teach, but not punish, the demented' (*Ep.* 36 Wright). And again, Christians 'have strayed rather from ignorance than of set purpose'. They are suffering enough already, and there is no need to add to their burden: 'We ought to pity rather than

[44] Constantius: *CTh.* 16.10.2, 341; 16.10.6, 356. But cf. 16.10.3, 342; Symm., *Rel.* 3.7; '*nihil ille decerpsit sacrarum uirginum priuilegiis, repleuit nobilibus sacerdotio. Romanis caerimoniis non negauit inpensas . . .*' Valentinian I was unambiguously for toleration: *CTh.* 9.16.9. 371 (referring to earlier law); cf. Amm.Marc. 30.9.5. Gratian issued an act of toleration after the disaster at Adrianople, see Socr., *HE* 5.2.1; Soz., *HE* 7.1.3; it was rescinded on 3 August 379, from Milan: *CTh.* 16.5.5. For Gratian's measures against paganism, see A. Cameron, 'Gratian's repudiation of the pontifical robe', *JRS* 58 (1968) pp 96–102.

[45] Cf. P. Brown, 'Aspects of the Christianization of the Roman aristocracy', *JRS* 61 (1971) pp 1–11. On the role of Ambrose, see J. F. Matthews, *Western aristocracies and imperial court A.D. 364–425* (Oxford 1975) ch 8, esp pp 186–92. Ambrose was particularly upset by the edict on teaching. See *Ep.* 17.4, on *CTh.* 13.3.5, 362 with Julian, *Ep.* 36 (Wright); cf. Amm. Marc. 22.10.7; 25.4.20.

hate men who in matters of the greatest importance are in such a bad way. For the greatest of blessings is reverence for the gods, just as irreverence is the greatest of all evils. So those who have turned aside from the gods to corpses and relics pay this as their penalty. We suffer in sympathy with those who are afflicted by disease, while rejoicing with those who are being released and set free by the aid of the gods' (*Ep.* 41 Wright). Julian did not launch a persecution, but the signs were ominous. His reign was sufficiently disturbing to persuade the Church to strike for a quick victory.

Julian was not the man to produce novel arguments in favour of toleration. His sentiments, if we disregard the Platonic colouring, resemble those of the reluctant tolerators, Constantine and, on the pagan side, Maximin Daia.[46] This was the contribution of Themistius, philosopher, rhetorician and courtier, who though a pagan had served Christian emperors and had been passed over by Julian.[47] A plea for toleration forms a substantial part of an oration delivered to Jovian on 1 January 364, in the hope that the new emperor, succeeding shortly after the death of Julian, could be steered into enacting laws of toleration. Almost at once Themistius lays down the axiom that moral and religious matters lie outside the sphere of legislation. This is an astonishing statement coming from an avowed champion of Hellenism. In ancient Greek thought the authority of the polis was held to be total. Unfortunately Themistius does not develop this highly promising line of argument, but he turns instead to the more conventional notion of the impotence of legislation. Laws can produce only apostasy and opportunism. He who changes his religion at the drop of a hat will change it back again with equal facility when the government is captured by the other side. This proposition is backed up with some homespun psychology: you cannot win support from someone who has not chosen to

Norman, *Themistius* (Teubner edn 1974) 3 pp 137–44, was held by several Christian commentators to have persuaded Valens to moderate his persecution of the Nicenes. See Dagron p 13 and n 73, pp 22, 186–90. Themistius is omitted in the otherwise useful B. Croke, J. Harris, *Religious conflict in fourth-century Rome: a documentary Study* (Sydney 1982).

give it to you in his heart. The same point is made more pungently by the pagan rhetorician of Antioch, Libanius, in his *pro templis*:[48]

> If they tell you that some others, in response to these measures, have been converted and now share their faith, don't be deceived, for they are talking of conversions that are apparent and not sincere. They say they have changed their beliefs; but they have not. This is the truth. They haven't abandoned their ancestral gods to worship new ones, but rather are cheating their persecutors. They go to their services, mix with their congregations, follow their other practices; they look as if they are praying, but they call on no one unless it is their own gods. It is wrong that they should be doing it in those surroundings, but all the same it is their own gods they are addressing. Just as in a tragedy, the man who plays the part of a tyrant is not himself a tyrant, but he who wears the mask of a tyrant, so each of them has remained himself; the change is merely apparent.

This is a powerful argument, drawing credibility from recent happenings when Julian put the clock back, but only momentarily.

Legislation is impotent and impermanent. In addition, the legislation of intolerance is out of step with the law of god, which states that every man must choose his own route (*hodos*). The existence of this law is confirmed for Themistius not by theological argument, but by an appeal to the nature and experience of man. On the one hand, as Homer says, 'Everyone sacrifices to a different god' (but it is a truth that is older than Homer), and God approves of this; on the other hand, anyone with a deep understanding of human nature knows that competition, 'a healthy rivalry in piety', brings out the best in men. There follow two similes. The first is of a race, in which all the competitors are striving toward the same goal, but not by the same route. The second is a comparison with the imperial army, which is not monolithic but consists of various elements with various functions and at various distances from the emperor—but all are devoted to him. The section ends with Themistius' vision of three principal cultures engaged in healthy competition: Syrian (that is, Christian), Hellenic, and Egyptian. The contrast with Julianic doctrine is marked: what Julian had seen as a fundamental conflict of religions

[48] Libanius, *Orat.* 30.28 (AD 386); R. Van Loy, 'Le "Pro Templis" de Libanius', *Byzantion* 8 (1933) pp 7–39, 389–404 (transl. and comm.); P. Petit, *Libanius et la vie municipale à Antioche au IV^e siècle après Jésus-Christ* (Paris 1955) pp 191–216. Libanius is attacking the destructive activity of monks in the train of Cynegius, Praetorian Prefect of the East (384–6).

(Christianity versus Hellenism) Themistius reduces to the more manageable problem of the contiguity of rival civilisations. Themistius is prepared to draw a discreet veil over the religious side of Hellenism, to sever culture from religion, in the interests of survival.

We come finally to the well-known exchange between the Roman aristocrat Symmachus and Ambrose, bishop of Milan.[49] Symmachus was no more inclined to theological argument than Themistius. He was responding to a concrete issue, the disestablishment of the *cultus deorum* by Gratian, and he addressed himself to the political role of the old religion and the social consequences of its neglect rather than to matters spiritual. The ritual observance of the state religion was the means of victory over the barbarians and the basis of the glory of Rome for some 1,200 years. When the *cultus deorum* was abandoned, disaster followed: 'While the vestals and priests were treated fairly, things prospered. When their emoluments were taken away, universal famine followed'. There was in fact a food crisis in Rome in the following year, 383.

So far the argument is solidly conventional and based on the *mos maiorum*. But Symmachus also uses the argument from tradition to clinch the case for religious diversity. Tradition told him that the mystery of godhead was not brought within man's understanding by any one means. Hence the form of religious observance could and should vary: 'to every man his own custom and his own ritual' (*suus enim cuique mos, suus ritus est*). The gods were known by the benefits they conferred, and they have sent man more ways than one in which to express themselves; there was no one way to so tremendous a secret.

Ambrose was prepared to debate the origin of Rome's greatness. It was not, he retorts, the worship of the gods which made Rome great, as for example the capture of the emperor Valerian by the Persians showed. Ambrose then boldly contradicts the assertion that the repudiation of the gods by Gratian had produced natural disaster: 'everything since then has progressed for the better'; there was no universal disaster—some provinces experienced ample harvests—and no punishment for sacrilege. In fact the bumper crops of the following year may be seen as a reward for faith. The two men, it is

[49] Symm., *Rel.* 3, ed O Seeck, *MGH Auct. Antiq.* 6.1 (1883) pp 280–3; R. H. Barrow, *Prefect and Emperor* (Oxford 1973) (with transl); see also M. Lavarenne's Budé edition of Prudentius vol. 3, (3 edn 1963), where the *Relatio* and the reply of Ambrose, *Ep.* 17–18 may be found together, and also Prudentius, *c. Symm.*

clear, had a similar idea of the role of religion in the world; they agreed that the security of the empire rested on the goodwill of the divine power or powers. Again, each accepted that the foremost issue between them was political, the safety of the state, Symmachus defending the guardianship of the traditional gods of Rome against Ambrose's conviction that in Christ the best insurance policy could be found. Against the argument from tradition, which Ambrose could not employ—his sensitiveness in this matter is shown by his talk of the pervasiveness of change—Ambrose pressed the claims of revelation. Thus on the issue of the toleration of dissent—for the state had now adopted the ideology of Catholic Christianity—Symmachus' assertion of a god-given diversity of forms of worship was met by Ambrose's retort that God revealed to man in Christ was an exclusive doctrine. God was a jealous god and had to be worshipped alone. Thanks to Scripture, his identity was clear—in contrast with that of the *numen multiplex*, the pagan supreme unknowable divinity in its various manifestations—and a Christian emperor could not condone idolatry. 'A Christian emperor has learned to honour the altar of Christ alone.' In a word, Ambrose's position was that the safety of the empire could be secured only by the exclusive worship of the Christian god.

V

Paganism in Graeco-Roman antiquity was not one religion, but a plethora of cults varying with the countless ethnic and political communities which made up the ancient Mediterranean world. No community claimed privileged or exclusive access to the divine, none denied the reality of another's gods or their viability for that other community. Each community, however, was proud and protective of its indigenous cults and in normal circumstances was not disposed to supplement them or permit them to be undermined or subverted from within. The trial and death of Socrates and the suppression of the Bacchanalia give an indication of the way the charge of subversion might be applied. The usual picture of civic cults as supple and receptive to foreign influences is a distortion of the truth. In any case, toleration is not synonymous with inclusiveness. In the case of Rome neither term seems to direct us to the essential point, which is that this was an expanding community bent on subjecting foreign peoples and their gods. Gods were treated as booty to be des-

troyed, transported, selectively assimilated, or simply left behind, defeated gods in defeated communities. It has been said of the Roman empire when the process of expansion was complete that it was 'completely tolerant, in heaven as on earth'—with acknowledged partial or total exceptions, notably Jews, Christians and Druids.[50] This is simply a misuse of terminology. The gods in question had been made subject together with the communities to which they were attached; the Romans had nothing to fear from them and cannot be said to have extended to them that combination of disapproval and acceptance which is toleration. To be sure, it suited Jews and Christians to argue that they were or should be on the same footing as the mass of pagan cults and rituals, but the argument is totally unconvincing.

The Roman state tolerated the Jews, at least from time to time, but hardly anyone else, certainly not the Christians. Toleration of the Jews was sporadic because their loyalty to the empire was an uncertain factor, dependent on close relations marked by exchanges of *beneficia* between individual leaders. Even from the most friendly Romans the Jews secured no more than *ad hoc* pronouncements supporting their freedom to practise their traditional rites and customs on grounds that were avowedly strategic and therefore ephemeral. The Roman authorities never committed themselves to a general statement on toleration. If they possessed the concept—and no doubt they did implicitly—they kept it to themselves.

Toleration theory was a byproduct of persecution and came from those in a position of weakness. The Christians proved more fertile in this area than the Jews, partly perhaps because they lacked most of the Jews' assets and bargaining points. It must be stressed, however, that very few out of the many Christian apologists contributed to the 'toleration debate', such as it was. Again, theoretical arguments for toleration were not a crucial weapon in the battle of paganism against Christianity.

As for the arguments themselves: Jewish, Christian and pagan apologists alike elevated the principle of religious autonomy and diversity into an argument for toleration—it was precisely this move which the leaders of the pagan establishment under the early empire failed to make. Conversely, there were individual moments of inventiveness when a breakthrough was made against the whole weight of classical tradition: Josephus' idea of common goodness,

[50] MacMullen p 2.

Tertullian's doctrine of *libertas religionis* and Themistius' glimpse of a political community in which personal morality and religion are not tampered with by legislation, are cases in point. The ancient 'literature of toleration' though unimpressive in bulk contained promising ideas which in some cases were to be elaborated and extended in later periods.

This paper has discussed policy and attitudes of governments and members of the elite. The impression has perhaps been created that ancient society was marked by intolerance at all levels, at any rate from the time when exclusive monotheistic religions became active in the communities (particularly urban) of the Mediterranean basin. Ordinary people did not always follow the lead of their social, political and ecclesiastical betters, insofar as a lead was given; and even where the wish of the authorities was unmistakable, it did not follow that official policy would find willing and effective executors in the localities. The argument works both ways: people might be less tolerant or more tolerant than they were expected to be. But at least we can avoid blanket generalizations, for example, that pagan Greeks and Christians alike were actively hostile to Jews as a matter of course. This assumption must be qualified in the light of, first, a decree of the early 40s BC which reveals that Jews had at one stage established a particularly strong position in the city of Sardis with the cooperation of the city authorities,[51] and second, a letter of the early fifth century AD, which shows that Jews and Christians had coexisted peaceably on the Balearic island of Minorca prior to the arrival in 417 or 418 of the relics of St Stephen which inspired the bishop Severus, author of the letter, to smash the synagogue and forcibly convert the Jews.[52] Again, the inefficacy of imperial pronouncements is demonstrated by, for example, the survival in fifth century Spain of the heresy of Priscillianism with the connivance of secular as well as ecclesiastical officials,[53] and—a rather different case—the existence of pagan practices, including the frequent consultation of soothsayers, astrologers and exorcists, among Augustine's own congregation in North Africa. Time-honoured

pagan remedies continued to command the respect of ordinary people, despite the promulgation of *Christiana lex* and the presence of a bishop prepared to enforce it.[54] 'In the later Roman Empire religious coercion in some form was one of the "facts of life" for a provincial bishop.'[55] Another 'given', it might be suggested, was a greater degree of coexistence, compromise—in short, toleration—between pagans and Christians than the ecclesiastical establishment would have liked.

REMARKS ON THE INSULAR CELTIC/HAMITO-SEMITIC QUESTION

Steve Hewitt

The hypothesis of a Hamito-Semitic substratum in the Insular Celtic languages elaborated successively by Morris-Jones, Pokorny and Wagner to explain a number of striking structural resemblances between Insular Celtic and Hamito-Semitic is enjoying a revival. While linguists have generally assumed that the parallels between Insular Celtic and Hamito-Semitic are to be explained in terms of Greenbergian typology (all languages of the VSO type), the recent work of Gensler, and also Jongeling and Vennemann, compels us to revisit the substratum hypothesis. The purpose of this article is to act as a guide to the main contributions on the question (several of which are reproduced in this volume), provide a table, arranged by author and language, showing the principal points of similarity, comment on a number of those points, and sound a note of caution against what might be called 'substratum frenzy'. An extensive bibliography is provided, with the following sections: 'The Insular Celtic/Hamito-Semitic question', 'Celtic – general', 'Hamito-Semitic – general' and 'Celtic influence on English'.

Main authors

Both Gensler, in his thesis 'A typological evaluation of Celtic/Hamito-Semitic syntactic parallels' (1993: 57–191), and Jongeling, in *Comparing Welsh and Hebrew* (2000: 6–64), provide extensive surveys of earlier authors on the Insular Celtic/Hamito-Semitic question. The first mention of structural similarities between Insular Celtic and Hamito-Semitic was in Davies, *Antiquae Linguae Britannicae* (1621), where a number of resemblances between Welsh and Hebrew were noted. Numerous other seventeenth, eighteenth and nineteenth-century Welsh authors draw parallels with Hebrew, but many of these focus on, to say the least, fanciful etymologies rather than structural

similarities. John Rhŷs, in *Lectures on Welsh Philology* (1877: 189 f.) and subsequent works raises the possibility that pre-Aryan languages may have exerted structural influence on the Insular Celtic languages.

Morris Jones, 'Pre-Aryan syntax in Insular Celtic' (1900, pp. 103–22 in this volume), reviews startling similarities between Welsh and Egyptian, including (pp. 625–6) the periphrastic conjugation *be* + preposition + verbal noun: 'In Welsh and Irish, although these languages retain many of the Aryan tenses, this construction is extremely common . . . The three prepositions commonly used for this purpose in Egyptian are *em* "in", *er* "to, for", *ḥer* "above" [= Loprieno, *Ancient Egyptian* (1995: 80), *m* "in", *r* "towards", *ḥr* "on"] indicating the present, future, and perfect respectively. These correspond in use with the Welsh prepositions *yn* "in", *am* "for", *wedi* "after".' He also notes the surprising parallels between Welsh *yn* and Egyptian *em* [= Loprieno *m*]: (1) preposition 'in', (2) 'in' + verbal noun = progressive, and (3) predicative and adverbializing 'in'. Other similarities are noted with Berber, but no Semitic language is examined. He concludes (p. 639) that the resemblance

> seems to involve an intimate connection of some kind between the two families of speech in the prehistoric period, though they are probably not actually cognate. It is with Hamitic, however, rather than Semitic, that Celtic syntax is in agreement; for, as we have seen . . . it . . . agrees with Berber where the latter differs markedly from Arabic, as, for instance, in the shifting of the pronominal suffix from the verb to a preceding particle . . . Is the influence of a Hamitic substratum to be discovered in the simultaneous development on the same analytic lines of French, Spanish, and Italian in their use of infixed and postfixed pronouns?

Morris Jones's article was not well received by the Celtic academic establishment of the day, and he never returned to the subject.

Pokorny's *magnum opus* on the subject, 'Das nicht-indogermanische Substrat im Irischen' (1927–1930), has been conveniently reduced to 64 features by Vennemann in 'Semitic → Celtic → English: The transivity of language contact' (2002: 324–6). Pokorny's discursive text is often impressionistic, with numerous examples (never glossed, at best paraphrased) from Hamito-Semitic languages, as well as as Cushitic, Bantu (including unseemly references (1927: 137) to '*Negersprachen*' deemed '*ungemein primitiv*'), Basque, Finno-Ugric, Caucasian, etc., all grist to his substratal mill. He proposes (1927: 100 ff.) that in a language with a strong, aristocratic literary tradition such as Irish, substratal influence may take some time (even several generations) to become apparent in the written language. As may be seen from the bibliography, Pokorny continued to write on the subject throughout his life; his most concise statement of the linguistic features shared by Insular Celtic

and Hamito-Semitic is in 'Keltische Urgeschichte und Sprachwissenschaft' (1959), where he identifies a more managageable list of 20 shared features, most of which are included in the table of shared features below. See also 'The pre- Celtic inhabitants of Ireland' (1960, p. 122 in this volume).

Wagner's main work on the Insular Celtic/Hamito-Semitic question (usefully summarised by Gagnepain in 'A propos du "verbe celtique"' (1961)) is *Das Verbum in den Sprachen der britischen Inseln* (The Verb in the Languages of the British Isles) (1959), especially the third part, entitled '*Die sprachgeographische Stellung des britischen Verbums*' (the linguistic geography position of the Brittonic verb), with sections on '*Das Keltische, Berberische, Baskische, Englische und Französische als Vertreter einer nordafrikanisch-westeuropäischen Sprachschicht, dargestellt am Bau des Verbums*' (Celtic, Berber, Basque, English and French as representatives of a North African–Western European linguistic stratum, exemplified by the structure of the verb), '*Das berberische Verbalsystem*' (The Berber verb system) and '*Bemerkungen zum semitischen Verbalsystem*' (Remarks on the Semitic verb system). He describes his basic position in 'The Celtic invasions of Ireland and Great Britain: Facts and theories' (1987: 19–20) as follows:

> Between the fourth and sixth centuries A.D. Insular Celtic suffered revolutionary changes . . . As a result of it Insular Celtic developed features and grammatical categories hardly found in other Indo-European languages. They have, however, close parallels in Berber and Egyptian, the Hamitic languages of Northern Africa, as well as in Basque . . . The linguistic structure of Insular Celtic compels me to assume that, long before the arrival of Celtic or Belgic tribes, these islands were populated by people, who spoke languages or dialects which, from the point of view of E. Lewy's typology could be described as Hamito-Semitic, languages not necessarily connected with but of a similar type as Berber and Egyptian and, somewhat more distantly Hebrew and Arabic. For my latest position on this subject, cf. my articles of 1976 and 1982. When Celtic was adopted by pre-Celtic populations, the structure of their original language(s) began to impose itself on the language of the Celtic invaders. The result was a linguistic revolution which led to the making of the mediaeval and modern Celtic languages. See also 'Near Eastern and African Connections with the Celtic world' (1981, p. 133 in this volume).

Hewitt, 'Quelques ressemblances entre le breton et l'arabe: Conséquence d'une typologie ordinale commune?' (1985), was written before I became aware of the Pokorny-Wagner tradition; I assumed that the resemblances could only be typological. The similar features reviewed include head-

dependent typology, VSO~SVO word order (main and subordinate clauses), verb-subject agreement/non-agreement, collective/singulative, conjugated prepositions, expression of 'have', the construct state genitive, compound 'construct-state' adjectives, double 'topic ≠ subject' sentences, relatives (restrictive, non-restrictive, on prepositional objects, on possessives), the dummy sentential pronoun, and circumstantial subordinating *and*. The chief shared feature omitted is the verbal noun, most certainly historically speaking a verbal noun in Breton, but in modern Breton, it behaves like an infinitive (accusative rather than possessive object pronouns).

Gensler, in his doctoral thesis 'A typological evaluation of Celtic/Hamito-Semitic syntactic parallels' (1993; extensive extracts in this volume, p. 151), examines 12 Insular Celtic or Hamito-Semitic languages plus a random sample of 58 other languages from all over the world. He identifies a set of 17 'exotic' structural features shared by Insular Celtic and Hamito-Semitic, but not common among languages worldwide. Assigning scores for each feature in each of the 70 languages, he concludes the following (p. 426):

> On the basis of the sample used in this study, nothing remotely close to the full-blown Celtic/Hamito-Semitic linguistic type recurs anywhere else in the world. The relatively few languages which are 'best matches' – actually rather poor matches – are scattered all over the globe, from the West Coast of North America to the Caucasus and New Guinea. However, the continental average score for Africa is higher than for any other continent, and drops only slightly when the CHS languages Egyptian and Berber are omitted; West Africa scores especially well, and appears especially hospitable to several of the CHS features (adpositional periphrastic, word-initial change, kin terms, inter alia). Conversely, Europe has one of the lowest average scores, and when Welsh and Irish are excluded its score drops far below that of any other continent. Celtic is thus radically out of place in a European landscape, whereas the Hamito-Semitic languages simply intensify a structural trend seen over much of Africa. A weak form of the CHS type, then, would appear to have a natural home in Africa, in particular Northwest Africa. Within Afroasiatic, the highest-scoring languages are on the Mediterranean; scores fall away in every direction, but the Chadic language Hausa (in West Africa) scores much higher than Cushitic Afar (in East Africa). The diachronic evidence, too, argues that the (weak) CHS type is something quite old in Africa: the African and Arabian case studies all show stronger CHS-ness further back in time. All this, in conjunction with the blood-type agreement between the British Isles and Northwest Africa, argues for some sort of prehistoric scenario specifically linking these two regions.

While Gensler does not claim to have proved the Hamito-Semitic substratum hypothesis for Insular Celtic, he does appear to be saying: 'in the face of such statistical results, what else can it be?' He takes great care with the weighting (0, ±½ ±1) of scores for individual features, but no account is taken of the centrality or frequency of each feature within a particular language, such that pervasive features such as the genitive construction (feature 8) have the same weight as more marginal ones like the idiomatic genitive kinship constructions (feature 17). Furthermore, the languages that score highest in Gensler's table, thus most strongly exemplifying what he calls the 'Celtic/Hamito-Semitic type', are the Insular Celtic languages rather than the Hamito-Semitic languages, i.e. the languages that are said to have been influenced by the Hamito-Semitic substratum which purportedly gave rise to the type. Another drawback is that possible typological explanations for some of the features (cf. remarks on the genitive construction below) are not envisaged or examined. Nevertheless, with his thorough analysis and the sheer wealth of linguistic evidence he has marshalled, Gensler has certainly put the Hamito-Semitic substratum hypothesis back on the map; all authors on the subject will henceforth need to take due account of his arguments.

Jongeling, *Comparing Welsh and Hebrew* (2000), provides an excellent, lengthy introduction to the history of the subject. The features he surveys include VSO, head-dependent order, numerals, nominal clauses, circumstantial subordinating *and*, relatives, the verbal noun, conjugated prepositions, and the lack of a verb '*have*'. He proposes (pp. 149–50) an interesting variant of the substratum hypothesis:

> Supposing that the explanation of certain peculiarities of Insular Celtic are due to substratum influence, one might suppose that the same or a similar substratum has influenced some subgroupings of Afro-Asiatic [Hamito-Semitic] . . . In short, this scenario would mean that we should consider Western Europe and North Africa as an old coherent area of VSO-character. The influence on the three northern Afro-Asiatic groups, Semitic, Egyptian and Berber is comparable to the influence on the Celtic sub-grouping of Indo-European . . . one might suppose that Western Europe and Northern Africa once formed one great contiguous VSO area. This area was split by the incoming Indo-Europeans. The proportion of Indo-Europeans on the continent was so great that any influence of a pre-existing language was blotted out, while the number of pre-Indo-Europeans inhabitants on the British Isles was such that their influence there was felt long after they were gone from memory.
>
> This scenario not only explains the congruity in syntax of Welsh and Hebrew but at the same time gives a reason for the lack of lexical correspondences not only between Welsh and Hebrew, but in general between Afro-Asiatic and Insular Celtic.

Vennemann sees a Hamito-Semitic substratum as having influenced Insular Celtic, and through Celtic, English. In 'Atlantis Semitica: Structural contact features in Celtic and English' (2001) he claims (p. 351): 'The European Atlantic Littoral was, at the dawn of history, explored and colonized by Mediterranean, probably Palaeo-Phoenician seafarers.' The main features examined in this article include the verbal noun and the related progressive construction, the English 'Northern Subject Rule' reminiscent of Semitic and Celtic verb-subject agreement, and the 'replacement of the sympathetic dative by the internal possessor construction' (*Jean s'est cassé le bras* vs *John broke his arm*, see feature 22 below). Explaining why what he calls the 'Atlantic type' arose only in Middle English, he reiterates (p. 364) an argument of Pokorny's and Wagner's: 'substratal influence originates in the lower strata of a society and usually takes centuries to reach the written language, and regularly only after a period of social upheaval.' In 'Semitic → Celtic → English: The transivity of language contact' (2002), in which he draws attention to circumstantial subordinating *and*, and the prevalence of tensed verb/auxiliary responsives in Celtic and English, Vennemann states:

> In my view the case is closed, the thesis of a Hamito-Semitic substratum underlying Insular Celtic being one of the most reliably established pieces of scientific knowledge there is in any empirical discipline. As Gensler has shown, the substratum really was not simply Hamito-Semitic, which is a huge family including hundreds of languages in Africa and Asia (which is why it is also called Afro-Asiatic or Afrasian), but more specifically Hamito-Semitic of the Mediterranean type, which includes Libyco-Berber, Ancient Egyptian, and Semitic. In order to stress the similarity of the substratum to this particular manifestation of Hamito-Semitic, I sometimes refer to it as Semitidic or simply Semitic.

Celtic influence on English

Given that Vennemann sees a connection between a Hamito-Semitic substratum in Insular Celtic and possible Celtic influence on English, an extensive bibliography on this aspect is provided below. The idea that certain features of English may be attributable to Insular Celtic is particularly in vogue among Finnish and German scholars, cf. articles by Filppula, Klemola, Vennemann, and especially Filppula, Klemola and Pitkänen (eds), *The Celtic Roots of English* (2002) and Tristram (ed.) *Celtic Englishes I, II, III*, *IV* (1997-forthcoming). This theory presupposes that the Anglo-Saxons were (thinly) superimposed on a British-speaking population which eventually shifted to Anglo-Saxon, leaving subsequent substratal structural traces in English. However, a recent study by Capelli *et al.* 'A Y chromosome census of the British Isles' (2003) has found genetic evidence to support the more

traditional picture of massive population shifts (p. 979): 'By analyzing 1772 Y chromosomes from 25 predominantly small urban locations, we found that different parts of the British Isles have sharply different paternal histories.' Coates, 'Invisible Britons: The view from linguistics' (2004) casts doubt on the influence of British Celtic on Anglo-Saxon.

Typological approaches

Not all authors dealing with similarities between Insular Celtic and Hamito-Semitic languages subscribe to the substratum hypothesis. Recent papers adopting a purely typological stance include Borsley 'On some similarities and differences between Welsh and Syrian Arabic' (1995), Isaac 'The function and typology of absolute and conjunct flexion in Early Celtic:

Shared features

The table on p. 237 shows the main features shared by Insular Celtic and Hamito-Semitic, according to author and language. The first 17 features correspond to Gensler's shared features (1993). These are followed by additional features identified by Morris Jones (1900), Pokorny (1927–1930, 1959), Wagner (1959), Hewitt (1985) and Jongeling (2000). Features marked with (✓) in the column for Gensler are mentioned by him, but are not central to his thesis; features 35–9 from Hewitt (1985) are given by no other author, and are purely typological in nature.

1 Conjugated prepositions

In both Insular Celtic and Hamito-Semitic, this looks historically very much like incorporation of a pronominal in the preposition; in Hamito-Semitic there is a single set of endings for prepositions, possessives and objects of verbs.

Breton	**Arabic**
gan-in	*maʿ-ī*
with-1.SG	with-1.SG
with me	with me
ma levr	*kitāb-ī*
my book	book-1.SG

. . . e' m laźhas	*qatala-n-ī*
TP OBJ.1.SG killed.PAST.3.SG	he.killed-LNK.CONS-1.SG
he killed me (traditional, Vann.)	he killed me

laźhed neus ahan-on
killed he.has of(=PRON.OBJ)-1.SG
he has killed me (modern, since eighteenth century)

2 Word order: VSO, head-dependent, prepositions

The verb-and-arguments word order typology of the languages of both families is basically verb-subject-object (VSO), with head-dependent order and prepositions. However, a number of qualifications are in order. As suggested in Hewitt, 'The impersonal in Breton' (2002), V in the formulae VSO, SVO, SOV, etc. is ambiguous, standing as it does for both the predicate (P) function and the tense-bearing element (T). Apart from a growing tendency towards SVO, Breton is at once VSO and V2. This is better described as PSO and T2, a more succinct formula being XTPSO, where X = P, S, O, Adv, etc. fronted from their base positions, or NEG, which suffices to occupy the initial position before T in second position, but also allows S, O, Adv, etc. (but not normally P) to its left; T attaches either to an auxiliary or, if there is none, to the main verb. One of the commonest realisations of XTPSO in matrix clauses, in fact probably more frequent than P(Aux)SO, is S(Aux)PO; on the other hand, . . . (Aux)PSO is generally the required order in embedded clauses (details in 'The impersonal in Breton').

Irish and Welsh are generally considered to be classic examples of VSO, and (apart from a strong V2 period in Middle Welsh, see Willis, *Syntactic Change in Welsh* (1998)) show no signs of a tendency towards SVO. However, Jones and Thomas, *The Welsh Language* (1977), analysed Welsh as TSPO, T again attaching either to an auxiliary or, if there is none, to the main verb; TSPO can thus be rewritten as either AuxSVO: *Mae Mair yn*

dysgu Cymraeg [is Mair in learn.VN Welsh] 'Mair is learning Welsh' or VSO: *Fe ddysgodd Mair Gymraeg* [AFF learnt Mair Welsh] 'Mair learnt Welsh'. So which is Welsh in the case of *Mae Mair yn dysgu Cymraeg*, SVO or VSO? It all depends on which you see as more important in V, the tense-bearing function (VSO) or the predicative function (SVO).

Most Hamito-Semitic languages are reckoned to be VSO, with the exception of Amharic (SOV, said to be due to a Cushitic substratum) and Akkadian (also SOV, said to be due to the strong influence of its predecessor and neighbour, the SOV isolate Sumerian). Hebrew shows a steady progression from clear VSO in the Biblical period to SVO in the Massoretic and modern periods. Similarly, Arabic is normally considered to be VSO, although, as in Breton, SVO is a common alternative order, even from the Koranic period; SVO has gained in prominence in modern times, to such an extent that certain styles of journalistic Arabic are reckoned to be more SVO than VSO, and some dialects, in particular Egyptian, are thought to be basically SVO, with only residual VSO effects.

However, in the case of Arabic VSO, another analysis is possible, with potentially far-reaching consequences for word order typology in general (see Hewitt, 'L'arabe – VSO ou VDN?' (2002)/'Arabic – verb-subject-object or verb-given-new? Implications for word order typology' (forthcoming)): in verb-initial clauses, there are numerous and regular violations of the canonical VSO order, such as VOS, VoS (o = pronominal object), VPOS (P = preposition), VPoSO, VPoOS, and VoOS. A principle of increasing 'information prominence' of post-verbal nominal constituents (given, known information > new information) appears to provide a unitary account of all the observable orders, *including VSO*. Strict SO order is thus called into question for Arabic, and replaced by a strict GN (given-new) order. Languages traditionally described as VSO (this principle does not appear to apply to any of the Celtic languages) or SOV (e.g. Turkish, Tibetan) might need to be revisited in order to see whether VGN or GNV does not provide a better account of their functioning than VSO or SOV. The whole question of VSO etc. is thus rather more complex than it would appear at first sight.

3 Invariable relative clause linker, not relative pronoun

The precise syntactic status of the Celtic relativizer, e.g. Breton direct (subject, object) *a*, indirect (oblique – other elements) *e* is debatable; it is usually held to be an affirmative tense particle which also functions as a relativiser of an embedded clause to its matrix clause, but it has also been analysed as a relative pronoun of sorts, particularly in the case of the cognate Welsh *a* and *y*. The invariable Hebrew *ăšɛr* has been analysed both as a relativiser and a relative pronoun, and note that the Arabic relative pronoun *al-ladhī* M, *al-latī* F, *al-ladhīna* M.PL, etc. agrees in gender and number with its antecedent.

4 Relative clause copying, not gapping: **the bed that I slept in it.**

Yes, Breton *ar gwele a meus kousked ennañ* [the bed AFF I.have slept in.it]; Arabic *as-sarīr al-ladhī nimt fī-h* [the-bed.M REL.M I.slept in-it], but such strategies are not limited to Celtic and Hamito-Semitic. Berber never has resumptive pronouns, only movement of the bare preposition; Old Irish is similar, but the order of relator and preposition is the reverse: Berber REL + PREP; Old Irish PREP + REL.

5 Special relative tensed verb form

This is present in Irish (*-as* vs. *-aidh*, *-ann*, etc.) and apparently in Egyptian and Berber; in Brythonic, the only modern trace is in the present form of the copula Welsh *sy(dd)*, Breton *so* (mod. *zo*); apart from Akkadian, this is unknown in Semitic; the Berber 'relative form' is commonly called a 'participle'.

6 Subject and object marking in verb

Yes, for both Insular Celtic and Semitic; this concerns most strongly Old Irish, Berber and Egyptian. Object pronouns are traditionally proclitic in Celtic and postclitic in Semitic; this is not the same, however, as the true subject-and-object-marking verbal morphology of Georgian. The cliticisation of object pronouns on the verb is hardly a rare trait.

7 Object marker: preverb-infix-V/V-suffix

This concerns especially Old Irish and Berber. It should be noted more generally that pre-versus post-cliticisation of object pronouns concerns many languages, cf. Romance, Serbo-Croat, etc.

8 Genitive construction: def. art. on dependent only: **house the-man**

Breton *ti ar roue* [house the king], Arabic *bait al-malik* [house the-king] 'the king's house'. Known as the 'construct state' CS among Semiticists, this is one of the most striking resemblances between the two families; however, it is not necessarily due to substratal influence. In the typology of genitive constructions, there is a limited number of parameters: (1) the order of head and dependent: H D or D H (VSO normally implies H D order); (2) the presence or absence of an article (on D only; on both D and H; no examples of the article on H only; all Insular Celtic and most, but not all, Hamito-Semitic languages have a definite article); (3) the relation marking may be on either H or D; and finally (4) a limited number of relator mechanisms (one or more are possible): (a) simple adjacency (H D, as in all Insular Celtic and Hamito-Semitic languages except Amharic, or D H); (b) phonetic modification of

either H or D: phonetic CS marking of H in Hebrew: *bayiṯ* 'house', but *bēṯ ham-mɛlɛḵ* [house.CS the-king]; *dāḇār* 'word', but *dăḇar ham-mɛlɛḵ* 'the king's word'; or phonetic modification of D in Berber: *agellid* 'king', but *axxam (n) ugellid* [house (of) king.CS]; (c) case: GEN, DAT, OBL, etc.; (d) possessive POSS: Turkish D-GEN + H-POSS: *kral-ın ev-i* [king-GEN house-his]; (e) link particle LNK: in both Hindi-Urdu and Sanskrit the link agrees with H: Hindi-Urdu *laṛkā* 'boy.NOM', *laṛkē kā ghar* [boy.OBL LNK_x $house_x$] 'the boy's house'; Swahili: *nyumba ya mfalme* [house.CL9 LNK.CL9 king.CL1] 'the king's house'; (f) adposition: preposition, postposition, cf. English *the door of the house* (the dividing line between (e) link and (f) adposition is not always clear, as the link could often be glossed 'of').

In Insular Celtic and Hamito-Semitic languages which no longer have case, the construct state is defined solely by the adjacency of the head and dependent, and the restriction of the article to the dependent. However, in both families this is probably the result of independent evolution. While Breton, Welsh, Hebrew and colloquial Arabic have no cases: Breton *dor an ti*, Welsh *drŵs y tŷ*, Hebrew *dɛlɛṯ hab-bayiṯ*, colloquial Arabic *bāb al-bait* [door the-house] 'the door of the house', Classical and formal Modern Standard Arabic and Irish (for some items at least) conserve case endings: Arabic *bāb-u l-bait-i*; Irish *doras an tí* [door.NOM the-house.GEN], and these help to define the genitive relation. It is only with the loss of the case endings that the [H [the-D]] structure becomes crucial to defining the genitive construction.

Germanic has both a compact genitive construction *the king's house*, with genitive case and only one article possible, on D, and a periphrastic construction *the house of the king* with two articles and the genitive relation expressed by the preposition *of*. While it is not obvious to ordinary English-speakers which element the article *the* applies to in *the king's house*, other Germanic languages provide a clue: German *des Königs Haus* [the.GEN king.GEN house.NOM] or Swedish: *kungens hus* [king.the.GEN house]. It therefore seems logical to bracket the phrase as follows: [[*the king's*] *house*], which is simply the reverse of the order of the two main constituents H and D in Breton [*ti* [*ar roue*]] or Arabic [*bait* [*al-malik*]]. Indeed, in one Germanic language which has lost all genitive case-marking, the [[the-D] H] order actually defines the genitive relation: the highly evolved form of English found in Jamaican Creole: [[*di king*] *hoos*]. Seen in this light, the Insular Celtic genitive structure is rather less exotic than it might appear at first sight; there is little need to appeal to Hamito-Semitic for a source.

Another factor to bear in mind in comparing the genitive construction in Insular Celtic and Hamito-Semitic is that of adjective placement. While neither Celtic nor Germanic languages have any problem in attaching adjectives to either or both H and D: Breton *ti bihan ar roue bras* [house little the king big] 'the big king's little house', Semitic cannot do this; any adjectives go obligatorily after the genitive construct, which is more akin to a compound noun 'king-house', so *bait al-malik al-kabīr* [house the-king

Verbal noun or infinitive?

Nominal features	*Irish*	*Welsh*	*Breton*	*Berber*	*Egyptian*	*Arabic*	*Hebrew*
Gender	✓	✗	✗	✓	–	✓	?
Article possible	✓	✓	✓	–	–	✓	?
Pronominal object: possessive	✓	✓	✓>✗	?	✓	✓	✓
Lexical object: genitive	✓	(✓)	(✓)>✗	?	(✓)	✓	(✓)

the-big] can in principle mean either 'the king's big house' or 'the big king's house'. Only in formal Arabic is it possible to tell which the adjective applies to, from the case-marking. The usual way of applying adjectives to both H and D is to use a longer construction with two articles and a preposition, structurally similar to the periphrastic construction *the house of the king: al-bait aṣ-ṣaghīr li-l-malik al-kabīr* [the-house the-little to-the-king the-big] 'the big king's little house'. If the genitive construction in Insular Celtic really had its origins in a Hamito-Semitic substratum, it is difficult to understand why this major structural constraint prohibiting the insertion of adjectives between H and D would not also apply in Celtic.

9 Non-agreement of verb with plural noun subject

Yes, this is a striking parallel, strongest in Welsh, Breton, Egyptian, Classical Arabic and to some extent Biblical Hebrew, in the last two with VSO order only; in Breton also with SVO order in the affirmative only; not in Berber. Non-agreement is fairly common with VS order worldwide (Greenberg).

10 Verbal noun, not infinitive (object in genitive, not accusative)

Is this a true dichotomy? There appears to be more like a cline between the abstract verbal noun (Arabic, Georgian *masdar*) and the infinitive (in any case said to be ultimately of nominal origin). The criterion for distinguishing between the two is whether objects are in the genitive (verbal noun) or accusative (infinitive). With the development in Breton since the eighteenth century of true 'accusative' object pronouns (etymologically '*of* + pronoun'): *ma gweled* [my seeing] > *gweled ahanon* [see.INF/VN of.me] 'to see me', little now distinguishes the Breton verbal noun from the French infinitive. In Insular Celtic, only Irish seems truly *masdar*-like.

11 Predicative particle: **he is in a farmer**

Especially in Welsh and Egyptian, if Welsh predicative *yn* really is 'in', and this has recently been challenged by Gensler in 'Why should a demonstrative turn into a preposition: The evolution of Welsh predicative *yn*' (2002).

The construction is '*In **his** farmer*' in Irish. This feature is very limited in Breton, mainly adverbial: *tri bloaż o veżañ ki, tri bloaż **en** ki, tri bloaż o vond er-maes a gi* 'three years becoming ("being") [a] dog, the years as ("in") [a] dog, three years leaving the state of doghood ("going out of dog")', and is marginal in Hebrew and Arabic.

12 Prepositional periphrastic: he is at singing

As Comrie points out (*Aspect*, 1976: 100–2), apart from Insular Celtic languages, which all have prepositional periphrastic constructions, copular locative phrases expressing the progressive are found in numerous other languages: Chinese, Georgian, Yoruba, Shona, Igbo, Kpelle, other Nigero-Congolese languages, Hindi/Urdu, Punjabi, North American, etc., not to mention Icelandic, various German dialects and Continental Scandinavian. However, no Semitic languages do this, although there is an increasing use of active participles. In Egyptian *ḥr* 'on' and *m* 'in' are both used with verbal nouns to express a progressive. Paradoxically, the Breton progressive is much closer in force to the English progressive than the Welsh or Scottish Gaelic periphrastic constructions, which have become a general cursive (imperfective) which freely allows statives (cf. Hewitt, 'Le progressif en breton . . .' / 'The progressive in Breton . . .'). Indeed, there appears to be a general tendency in various languages for a parallel evolution of simple tense > specialised uses, and progressive > general imperfective; cf. the evolution of Welsh, Hindi and Hebrew below:

Classical Welsh
siarad-af
speak-PRES/FUT.1.SG
I speak / I will speak

yr wyf yn siarad
TP be.PRES.1.SG in speak.VN

koteḇ	*koteḇ*
write.ACT.PRT.M.SG	write.ACT.PRT.M.SG
he (was/is/will be) writing	he writes / is writing

13 Periphrastic DO: he does singing

This conflates at least three distinct uses: (1) activity DO with dynamic (non-stative) VPs: (Middle) Welsh, Breton; (2) DO with NPs: numerous languages; (3) DO as an empty auxiliary: North Welsh; Breton to avert V-1 in the affirmative (also English *do* with negative, interrogative). This is not typical of Semitic.

a thrannoeth yn jeuenctit y dyd kyuodi a oruc (1, Middle Welsh)
and next.day in youth the day rise.VN TP did.3.SG *Pwyll Pendefig Dyfed*
and on the morrow when the day was still young, he arose

dysgynnu ar y pren a wnant
descend.VN on the tree TP do.3.PL.PRES/FUT
they will alight on the tree
(1, Strachan, *Introduction to Early Welsh*, §123)

a cherdet recdi y r coed a oruc y uorwyn
and walk.VN before.3.F.SG to the wood TP did the maiden
and the maiden went on to the wood
(1, Strachan, §123)

rinne sé gáire (2, Irish, Wagner, *Das Verbum . . .*, p.101)
did he laugh.N
he laughed

na i weld o fory (3, North Welsh colloquial)
do.FUT.1.SG I see him tomorrow
I will see him tomorrow

sevel a ra tîer (3, Breton)
raise.VN TP do.PRES.3.SG houses
He/she builds houses

sevel tîer a ra (1, Breton)
raise.VN houses TP do.PRES.3.SG
He/she builds houses (lit. 'does house-building'; dynamic verbs only, not statives)

14 Circumstantial clause **and** S PRED *(subordinating* **and***)*

This feature is typical of both Insular Celtic and Hamito-Semitic (in Berber it is possibly borrowed from Arabic): Breton *gweled neus ahanon ha me o tond er-maes* [seen he.has me.OBJ and I PROG come.INF out], Arabic *laqad ra'ā-nī wa-'anā ṭāli'* [PFV he.saw-me and I coming.out] 'he saw me as I was coming out'. The construction is syntactically coordinate (in both Celtic and Semitic, the order after '*and*' is always SVO), but semantically subordinate; an adversive '*although*' connotation is possible.

15 Nonfinite possible instead of finite main-clause verb

This is particularly prevalent in Welsh, followed by Hebrew (infinitive absolute), but not in Arabic. There are sporadic examples in Irish and Breton.

16 Word-initial phonetic changes (mutations), various syn. functions

The Insular Celtic initial consonant mutations are hardly comparable to the Berber 'construct state' initial changes *argaz > urgaz (wərgaz)* 'man', *tamɣart > tmɣart* 'town', which appear to be more akin to vowel contraction, cf. the Hebrew construct state forms described under feature 8. As formulated, this is rather too abstract a feature to be confidently attributed to substratal influence, and there are numerous instances worldwide of results of phonetic changes acquiring a grammatical function, cf. the correlation of transitive/intransitive with unaspirated/aspirated stops in the Modern Lhasa pronunciation of Tibetan, a consequence of the phonetic evolution of initial consonant clusters in that language:

spel	*skol*	*spur*	(Classical Tibetan, Beyer, 258–9)
/¯peː(l)	¯köː(l)	¯pur/	(Modern Lhasa pronunciation)
increase (tr.)	boil (tr.)	scare away	
'phel	*'khol*	*'phur*	(Classical Tibetan, Beyer, 258–9)
/¯pʰeː(l)	¯kʰöː(l)	¯pʰur/	(Modern Lhasa pronunciation)
increase (intr.)	boil (intr.)	be scared away	

17 Idiomatic genitive kinship constructions: **son of X**

This is very productive in Semitic, cf. Iraqi Arabic *abu chegāyir* [father.CS cigarettes] '(street) cigarette seller'. It is not typical of Brythonic; the few examples in Insular Celtic are in Irish: *mac tíre* [son land.GEN] 'wolf'.

18 Nominal clause (absence of copula)

There is no copula in the present tense in Semitic, only in non-present (future, past) tenses. This is not the same as ellipsis of the copula in Insular Celtic, especially Welsh, and to a lesser extent Breton, in gnomic expressions.

19 Amplification of negative by noun after verb: French **pas**

Arabic dialects (Palestine and westwards) have developed a French-like circumfix *mā V-sh* (<*shi* 'thing'); Welsh *ni V S ddim*, Breton *ne V S ked*. This is surely part of a general linguistic tendency to amplify function words that otherwise risk being lost altogether.

20 Numerals followed by singular

Yes, in Brythonic; in Irish, originally nouns after 20 and higher multiples of 10 stood in the gen. pl.; due its identity with the nom. sg. in some declensional classes, this gave rise to its reinterpretation as singular. In Semitic, 11 and higher – 3–10 are followed by nouns in the plural. Numerals are followed by singular nouns in many languages.

21 Prepositional expression of **have**

Yes, Breton is the only Celtic language to have developed a verb 'have': *m-eus*, etymologically [to.me-there.is] 'I have'. This is used for perfect tenses . . . *meus gweled* [I.have seen] 'I have seen' and possession of indefinites *arc'hant meus* [money I.have] 'I have money', but possession of definites is usually expressed with prepositional periphrasis *an arc'hant so ganin* [the money is with.me] 'I have the money', as it is in the other Celtic languages, Hamito-Semitic and many other languages worldwide.

22 Possessive **he broke his arm** *rather than dative* **il s'est cassé le bras**

Yes, this is true of both Insular Celtic and Hamito-Semitic; 'internal' possession with a possessive, rather than 'external' possession with a dative is rare in European languages, with the exception of Celtic and English. It is unclear which is more common worldwide. Note that Breton requires a combination of both types (possessive + dative) where the possessor of the object is not the same as the subject (possible, but not obligatory in French):

Mae Ieuan wedi torri 'i fraich
is Ieuan after break.VN his arm
Ieuan broke his arm

Mae Ieuan wedi torri braich Pedr
is Ieuan after break.VN arm Pedr
Ieuan broke Pedr's arm

(Welsh)

Jean s' est cassé le bras
Jean RFL is broken the arm
Jean broke his arm

Jean (lui) a cassé le bras à Pierre
Jean (to.him) has broken the arm to Pierre
Jean broke Pierre's arm

(French)

Yann neus torred e vrec'h
Yann has broken his arm
Yann broke his arm

Yann neus torred e vrec'h da Ber
Yann has broken his arm to Per
Yann broke Per's arm

(Breton)

deus 'ta heol benniged da dommañ o revrioù d' ar ffiliped (Breton)
come then sun blessed to warm.INF their backsides to the sparrows
come on, dear sun, and warm the sparrows' backsides

23 Preference for parataxis (Pokorny: **anreihend** *'stringing along')*

It is unclear how such a feature, identified by Pokorny, could be measured, and if it could be demonstrated, whether it is really unique to Insular Celtic and Hamito-Semitic.

24 Basic unit word group rather than single word

Again, it is unclear how such a feature might be measured, and whether it is unique to Insular Celtic and Hamito-Semitic.

25 Subjectless sentences (impersonal constructions)

Both Pokorny and Wagner list this as a common feature. This probably covers a number of distinct phenomena which need closer definition, and in any case, it is hardly unique to Insular Celtic and Hamito-Semitic.

26 No presentlactive participle

Yes, for Insular Celtic, but not true of Semitic at all.

27 Distinction between essential and contingent BE **(is/tá)**

Yes, in Irish (*is*/*tá*) and Breton (*eo*/*emañ*), but not in Welsh or in Semitic. Again, such a distinction is quite common worldwide.

28 States/relations expressed with **N (PREP-O) PREP-S**

Yes, cf. Irish *Tá scilling agam ort* [is shilling with.me on.you] 'you owe me a shilling', *tá tart orm* [is thirst on.me] 'I am thirsty'. Felt to be very typical of IC; not particularly typical of Semitic.

29 Welsh **yn**, *Egyptian* **m** *'in': predicative, locative, progressive*
